1906 92

INDEX TO VOLUME XCII OF THE MINING AND SCIENTIFIC PRESS FROM JANUARY TO JUNE, 1906

A

Page.
*Abandonment 323
*Absorption of Cyanide Solution in Tanks 155
*Of Cyanide in Vats 233
Of Mineral Land 66
*Acceleration of Gravity, To Find 83
Accident, A Curious 223
*Accidental Discovery of New Mines 307
*Accidents with Nitro Powder 175
*Acetylene Blowpipe 295
*Lamps in Mines 307
*Acid Rocks and Modern Volcanoes 307
Adaptation to Environment 306
Adirondacks, Prospecting in 310
*Adits to Develop Water 307
*Adjustments of Concentrating Machines 175
*Of a Transit 155
*Advantage of Machine Drills 3
*Aerial Tramways 233
*Life of Rope on 253
After the Disaster 287
*Age of California Auriferous Series 277
††Agitator for Cyanide Solutions 165
*Agitation of Sulphides in Cyanidation 295
*Agglomerate 323
*Agricultural Patents, Extra-lateral Right 195
*Aid of Prospectors by Government 51
Air Compressors at the Champion Mine (Mich.) 72
*Compressor, Safety Valve 175
Blasts in Mines 118
Blasts in Atlantic Mine 375
Hammer Rock Drills 128-196
Vs. Electricity 18
Akers, William A. 427
*Alabandite 35
Alaska and the U. S. Survey 232
†Lode Mining in 414
Railroad Building in 306
†Vein Mining in 310
Volcanoes 174
†Alderson, Matt W. 235-238
Victor C. 194
*Alkaline Phosphates, Solubility of 35
*Alteration of Limestone 3
*Of Ore Deposits 341
*Alternating Electric Current 119
*Altitude of Mines 67
Aluminum as an Electrical Conductor 127
Determination of Copper 26
*In Steel, Effect of 101
Paper 127
Production of 88
Solder 260
*Soldering 175
*Specific Gravity of 19
Uses of 25
Alvarado, Pedro 305
Alzane, an Alloy 415
*Amalgam, Gold Content of 3-35
Amalgamated and Mr. Heinze 99
Plates 176
Plates of Muntz Metal 50
*Amalgamating in Grinding Mills 195
††Plates 224
*Plates, Annealing 101
Plates, Cleaning 7
††Amalgamator 205, 262, 303, 420
Amalgamation, Effect of Temperature on 418
In Cyanide Mills 69
*Of Variable Ore 341
American Capital in Mexico 2
Citizenship 18
Opportunity in Siberia 173
Institute Mining Engineers, Meeting 321
Mining Congress 22
*Ammonia, an Antidote 233
Anaconda, Annual Report 339, 352
†Recent Improvements at 140
Rise in 34
*Analogy in Mines 137
*Analysis of Slag 35
*Anchoring Pipelines on Hillsides 307
*Stamp-battery Mortars 431
Ancient Fallacy, An 17
*Rivers of California 67
Ruins in Africa 99
Anderson, W. G. 260
*Angle Flange Unions 119
*Anhydrite 195
*Ankerite, Auriferous 323
*Annealing Amalgamating Plates 101
Annihilation of Distance 49
Anniversary of Technical Journals 251
*Annual Assessment, Excess 195
*Assessment Necessary 19
*Assessment on Patented Claims 377
*Assessment Work 57
*Assessment Work, Who May Do It. 3
Report Anaconda Co. 339, 352
Another Earthquake Theory 297
*Anticlinal Fold 277
*Antimony 51, 106, 110, 217
*Gold Ore, Treatment of 378
*Occurrence of 431
Ores, Separation of Gold From 280
*Production 175
Volumetric Estimation of 419
*Automatic Sampling 341
*Averaging Assays 119
*Apex, Legal 3
††Apparatus for Detecting and Localizing Mineral Deposits 336
††For Agitation of Solutions 43
††For Exploding Mine Charges 27
††For Grinding, Washing and Separating Ore 67
††For Mining Granular Material 438
††For Producing Compounds of Tin 111
††For Recovering Precious Metals 75
††For Sharpening Rock Drilling Machine Bits 142
††For Smelting Ores 438
††For Smelting and Converting Ores 142
††For Storing and Conveying Liquid Metals 93
††For Treating and Amalgamating Metals 43
††For Treating Slimes 142
Applied Geology 92
Appropriation for the Geological Survey 429
*Aragonite 155, 359
Arbitration, Compulsory 429
Argall, Philip 325
*Argentite and Argentine 295
*Arizona Mining Law 195
Arnold, N. A. 230
†Arsenic of Mexico 436
*Arrangement of Metallurgical Plant 137
*Arrastre, An Open 119
*Arsenic and Sulphur, Detection of 214
To Determine 349
Arsenical Gold Ores in South Dakota 23
*Sulphides, and Gold Pockets 253
Artificial Pumice Stone 85
Arts of the Mine Promoter 25
*Asbestos 155
*Occurrence of 253
Ascending Solutions 216
†Assay Furnace, Wood-Burning 329
*Ton 119
Of Cyanide Solutions 259, 278
Assaying 251
*Copper Matte 195
*Roughly 19
*Assays and Mill Results 377
*Assessment, Annual, Who May Do 3
*Work on Mining Claims 19
Atlantic Mine, Air Blasts in 375
Atoms, Molecules and Mass 55
*Atomic Theory 295
*Attivation for Refractory Gold 295
*Auriferous Rocks 307
*Slates of California, Age of 277
*Sulphides in California Ores 137
*Sulphides in Wall Rocks 35
*Sulphide, Occurrence of 295
Austen on the Orient 100
†Austin, L. S. 65, 140, 296
Austin, O. P. 91
Australian Development 100
Goldfields, Leading 243
Prosperity 411
Austria-Hungary, Mineral Wealth of 144
Authoritative Opinion 347
*Automatic vs. Hand Feeding 295
††Safety Attachment for Stamp Mills 93

B

Bad Language 293
Bair, Joseph H. 306
*Baja California 155
Bancroft, Geo. J. 365
Banket in Rhodesia 57
*Barium Peroxide in Cyaniding 253
Barnes, Harold B. 103
*Barometer in Mines 175
*Barrel, Contents of 233
Barrientos Tunnel 236
*Basalt, Description of 341
*Basaltic Rocks, Gold in 175
*Battery Posts, Position of 295
*Bauxite in the United States 3
†Bay of San Francisco, Map of 256
††Bearing for Rock-Drills 438
Metal 200
*Belt Conveyor at Homestake 3
Bendigo, Gold Production 106
Australia 65
*Bends and Elbows in Pipe-Lines 119, 253
†Berkeley, California 273
*Bessemer Process, Cast Iron for 359
*Best Field for the Prospector 3
Rifle for Platinum 236
†Shape for a Shaft 120, 139, 156, 176, 196, 215, 216, 234, 235, 254, 255, 308
Bewick-Moreing & Co. 357
*Big Horn Mountains of Wyoming 19
*Bingham Canyon (Utah) Mines 431
District, Utah 195
Bisbee, Miners' Union at 373
Bismuth 160
*Bits for Drilling Sandstone 155
Black Hills, Electricity in Mines of 53
*Sand 119
Sands Experiment, Appropriation for 117
*Blast Furnace, Freezing, to Prevent 67
†Furnace vs. Reverberatory ....136, 138, 197, 215, 279, 296, 342.
Blasting, Notes on 381
††Powder 384
*Bleaching Powder 233
†Block Faulting and Its Relation to Ore Deposition 54
Faulting in the Great Basin 251
*-Hartman Process 51
'Blout' 411
*Blowing Out of Copper Furnaces 295
*Blowpiping 413
*Bluestone 35
Bluestone 182
*Making 253
Blum, Anthony 342
*Boiler Scale, Prevention of 101
†Transporting a 419
*Boiling Point of Water 233
*Bonds for Shaft Sinking Contract 295
*Borax 51
Industry 71
*Minerals, Occurrence of 175
†Boring of an Oil Well 119
†Bosqui, E. L. 65, 68, 217, 257, 342
Boss, M. P. 103
*Boutwell, J. M., on Bingham 195
Boursin, Henry 216
Bragg, Rufus M. 125
Brauner, John C. 339, 347
*Breccia 323
Breckenridge's Generosity 287
Breveton, R. M. 378
Bretherton, S. E. 215
†Brewer, W. M. 414
Broken Cross Wires, Repairing 110
Brooks, Alfred H. 232
Brooks Bill, The 65
†Brown, E. Percy 378
Horace F. 312
R. Gilman 37, 235
†Building a Concrete Tank 146
*Concrete Walls 83
*To Withstand Earthquake 323
*Built Up Timbers 101
†Timbers 234
*Bulk and Weight of Quartz Ore 295
*Bulletins, California State Mining Bureau 175
Bureau of Geology, New 212
Burning of San Francisco, as Seen from Berkeley 270
Business of Contracting, a Review 445
†Bustos Mill, Guanajuato, Mexico 307
Butte, Eight-Hour Day 305
Ores, New Method of Smelting 281
Venietta 135
Butters, Chas. 339, 344
†Burrows, R. H. 120

C

Cage for Crushers and Pulverizers 129
††For Mine and Elevator Shafts 57
*Calculation of Cyanide Solutions 19
*Caliche 119
*Calcite 359
Calcium 20
*Borate 341
*Borate in Mud Formation 35
*Carbide 359
*Chloride 233
*California Ancient Rivers 67
*Canals, Cost of 119
*Foreign Corporations in 83
*Glaciation in 195
*Gold Ores 175
*Law Requiring Two Shafts 67
Magnesite in 103, 107
Mines Association, Committees 40
State Mining Bureau 33
*State Mining Laws 307
*Stock Assessable 431
California's Opportunity 322
*Calumet, First Dividend 277
†& Hecla Mine 9
& Hecla Production 293
*Cameron Pump 233
*Caminetti Act 413
†Camp Bird Mill, Destruction of 200
†Bird Mine 200
†Bird Mill, After the Snowslide 242
Canadian Geological Survey 342
Cantilever Bridge Over the Zambesi 72, 153
†Stamp Battery 104, 105
*Cap Sill 155
*Capacity of Crushing Rolls 35
*Of Rockbreakers 35
*Of Stamps 119
*Vs. Saving 119
*Cape Nome, Alaska 101
Capping a Hoisting Rope 109
*Carbon Dioxide, How Detected 19
*Care of Engine and Rock Drill Cylinders 277
*Carload, Meaning of 233
*Carnotite, Value of 233
Car Shortage in Mexico 17
Case-Hardening Iron 242
Cassius, Purple of 295
*Cast Iron for Bessemer Process 359
*Casualty Insurance 277
Cause and Nature of Earthquakes 272
*Causes of Foaming Steam Boiler 101
*Of Steam Boiler Explosions 51
*Caving System in Mining 307
Cement in 1905 342
Increased Use of 37
Detection of Adulteration in 382
*Making in Mexico 295
*Portland 67
Production 104
*Cemented Reservoir 295
Cements 297
†Central Mill of North Star 240
*Centrifugal Pumps 119
*Chalcocite 253
†Champion Mine 198
Copper Mine (Mich.), Compressors at 72
Chances in Mining 18
Changes at Pachuca 135
††Channeling Machines 366
†Channing, J. P. 193, 198, 293
*Character of Furnace Slags 295
Character of Wealth 412
*Charcoal as a Precipitant of Gold 253
††Charging Apparatus for Blast Furnaces 75
Cheap Mining 347
*Checking Crack in Metal 119
Chemical Test for Wolfram 38
Chile, Metal Output of 204
Chinese Cheap Labor 49
†Exportation of, to Transvaal 55
On the Rand 2
China, Copper Coins in 121
*Chloride of Silver 119
*Chlorination by Electrolysis 119
Christie, S. B. 273
Chromite 302
*Churn Drill 233
Drill, Sampling with 327
Church, John A. 196
*Cinnabar, Occurrence of 359
*Circular Shafts 19
†City Hall, San Francisco, Showing Effect of the Earthquake 289
*City Streets, Mineral Under 214
†Claim Map of Pachuca 345
*Claims May Be Located on Sunday 35
Classification of Land 339
*Of Workmen 277
††Classifier 384
*Clay and Talc 233
Henry 125
*Clays 137
*Clean-up of Mill 232
*Of Hydraulic Mines 195
Cleaning Amalgamating Plates 7
*Greasy Machinery 137
†Coal Mine Disaster in France 173, 180
††Mining Machine 57
Production 162
Strikes 213, 340
Testing Plant 426
Vein, Lead-Zinc Sulphite in 101
Cobalt District, Canada, Mineral Rights in 251
Mining Excitement 339
†Ontario 92, 153, 161
*Cohesion Between Wood and Cement 295
*Coiling Wire Rope 175
*Coinage of Silver 175
*Coke Feed in Blast Furnace 431
*Cold, Intense 277
†Collapsed Dwelling in San Francisco 289
Collapse of Open Workings at Kimberly Mines 365
*Collections of Minerals 51
Colorado College, Donation to 135
*Colored Candles for Miners 295
††Combined Steam Engine and Air Compressor 43
*Companies Operating in California 119
*Compressed Air in Ventilation 233, 326
*Air Vehicles 101
Air vs. Electricity 20, 36, 84, 120
*Compression of Air, Effect of 359
*Of Mine Timbers 19
††Compressor 185
Compulsory Arbitration 429
*Comstock Dumps 195
*Maximum Output of 67
Lode, Modernizing 183
Lode, Nevada 117, 155
Theo. B. 138
Concrete 292
*In Chimneys 119
*In Mines 295, 377
Piles 235
†Tank Construction 146
*Walls, Foundations for 83
Concentrate, Cyaniding 72
Concentrates Department and Its Function 81
*Concentrating Ore 3
*Sulphuric Acid 253
Concentration 164
*Crushing for 101
†Mill 218
*Water Required for 67, 137
Concentrating Copper Ore 436
††Concentrator 244
Concerning the Earthquake 294
*Conditions Essential to Formation of an Orebody 307
*Of Forfeiture 295
*Conflicting Extra-lateral Rights 341
Conservation of Natural Wealth 199
*Construction and Capacity 307
Consumption of Copper 53, 261
*Conglomerate 323
Connection of Survey Officials with Technical Publications 110
Contact Zones 212
Zones, Formation of Minerals in 220
††Container for Filter Presses 185
*Converging in Depth, Veins 175
Conversion Table, for Silver Currency ....
††Converter 111
*Linings 67
*Converting at Butte 413
*Copper Matte 51
††Conveying Apparatus 262
††Conveyor 75, 165, 205
††Belt Support 43
††Chute 185
††Scoop 111
†Cooper, A. S. 301
*Co-Owner, Relocation by 233
*Co-Partner, Relocation by 19
*Copper at Rawhide Buttes, Wyo 341
Coins in China 121
Consumption 53, 236
*Converting at Butte 413
*Cost of Producing 155
*Converting 51
Determination of 53
*Effect of Heat on 101
Electrolytic 20
Exports 20
*Glance 253
*Gold Ores, Assaying 195
In China, Use of 37
In Virginia 297
*Matte, Assaying 195
†Mining on Lake Superior 198
*Ore of La Sal District 322
*Ores, Treatment of 155
*Precipitation from Mine Water 195
Prices of 50, 121, 193
Production 362
Production and Consumption 411
*Production in the United States 413
Recovery of, from Mine Drainage 325
Refining 38
River, Alaska 177
†Smelter, Site of 256
Statistics 432
Stimulated Demand for 269
*Sulphate, Making 253
†Trade of the World 8
††Core-Drill 420
Drilling 310
†Cornish Pump Crosshead 87
*Corporation Law in Montana 307
*Corporations of Same Name 119
Corrosion of Steel-Frame Buildings 8
*Corundum 359
†Cost of Cables 157
*Of Concrete 295
*Of Crushing Rock 35
*Of Fuel 277
*Of Gold Mining 51
*Of Hydraulicking 35, 377
Of Iron Foundings 33
*Of Mining at Great Depth 19
*Of Mine Patent 195
*Of Producing Copper 119, 155
*Of Mining Timbers 83
*Of Shaft Timbers 51
*Of Smelting 359
*Of Stoping 51
Costs in Mining 37
Counterfeit Processes 174
*Coeur d'Alene Mines 67
*Early Discoveries in 195
Covellite 434
†Crane, W. R. 85
Criticism and Suggestion 308
Crosscutting Advisable 22
*Cross Hairs of Transits, Caution 175
†Crosshead Cornish Pump 87
*Crossheads for Shafts 155, 253
*Cross Location 377
*Lode Locator, Law for 101, 359
†Section of the Bustos Mill 23
*Veins 3
Crude Oil vs. Steam 346
††Crusher 129
*Crushing Capacity of Rolls 35
*For Concentration 101
*Mills, Types of 119
††Rolls 244
*Rolls, Operation of 377
*Rolls, Power for 137
††Or Pulverizing Apparatus 438
*Strength of Timbers 19
Crust of the Earth 85
*Cryolite 3
*Crystallization from Saturated Solutions 253
Cullinan Diamond 378
*Cupellation, Loss of Gold in 101
††Cupola 303
*Cuprite 253
Curious Accident 223
Curle, J. H. 52
*Curvature of the Earth 119
*Curves in Inclined Shafts 19
*Transition 19
*Custom Smelter, First in Colorado 155
Cutting a Gauge Glass 255
*Edge of Drilling Bits 155
*Timber on Public Lands 137
Cyanidation of Concentrate 72
Of Silver 2
*Cyanides 277
Cyanide as a Factor in Gold Production 9
Industry, The, a Review 249
Precipitate, Refining of 329
Process at Guanajuato 7
Process, Lime in 162
*Solutions, Caution 155
Solutions, Assay of 259, 278
*Solutions, Calculation of 19
*Solution, Making 67
*Solutions, Mercuric Salts in 83
Sores 89
††Tank Gate 303
*Vat, Absorption by 233

Callow System of Ore Classification

As Applied to the Concentration of Finely Crushed Materials, and the Recovery of Operating Water.

It will be generally admitted that the greatest problem in ore dressing has been the proper and accurate sizing of finely crushed material. Hitherto the limit of exact sizing—in other words, screen sizing—has been in the neighborhood of 2 mm. The Callow screen has enabled screen sizing to be carried to any mesh, 200 inclusive, but while on a certain grade and character of ore this will be found perfectly practical and feasible, yet on other ore, less complex and of lower grade, it may be considered an unnecessary refinement. But whether 80, 100 or some finer mesh may be determined upon as the practical limit for a particular ore, there is still left in any case a wide range of undersize particles on which it is equally as important and profitable to practice some form of sizing or sorting. Any contrivance calling for additional water for this purpose is inconsistent, since these pulps are already too dilute, and if surface or whole current classifiers are used, the sorting performed by them is so crude and their several products so badly contaminated with slime that they offer no practical advantage over a simple settling scheme. Therefore, for any improvement in this department some fresh element must be sought for. This is found in the percussion table, which both concentrates and classifies, stratifying its feed not only into bands of gangue and mineral and their intermediate products, but also separating the sand from the slime more effectively than any other apparatus, and this without the addition of any water other than that necessary for the regular operation of the machine.

The practical limit of screen sizing having now been advanced from 2mm. to 80 mesh or finer by the invention of the TRAVELING BELT SCREEN, and with the CALLOW SETTLING AND PULP THICKENING TANK at hand for settling and thickening the undersize and combining these with TABLE CLASSIFICATION, a thoroughly practical and perfect system of sizing is the result, which is fully set forth in the accompanying diagram. It will be noted, moreover, that the recovery of water incident to this arrangement is no less important than the other features characteristic of the system.

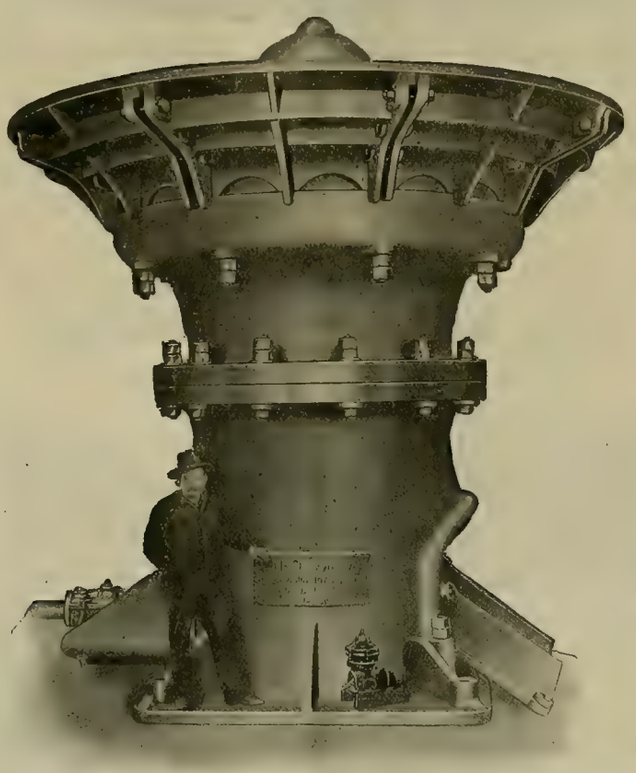
POWER AND MINING MACHINERY COMPANY

McCully Rock and Ore Breakers

(The pre-eminence of the McCULLY is indisputable.)

are the only crushers with the suspended shaft which are giving absolute satisfaction. We have sold in the past six months, six No. 9 crushers, each having a capacity of 300 tons and upwards of rock and ore per hour. This alone indicates the superiority of the McCully over all other types and makes of crushers.



have the following points of superiority:

Perfect suspension device of main shaft, point of suspension being at the fulcrum or point of no motion.

Gears made of steel.

Drop bottom.

Perfect and dust-proof oiling arrangement for eccentric.

Removable countershaft bearing.

Rigid spider with large and unobstructed receiving openings.

Large capacity with minimum of repairs.

Small power required to operate.

WE ALSO BUILD AND DESIGN

Complete Plants for Mining and Milling of Ores,
American-Crossley Gas Engines,
American-Crossley Suction Gas Plants,
Loomis-Pettibone Gas Generators.

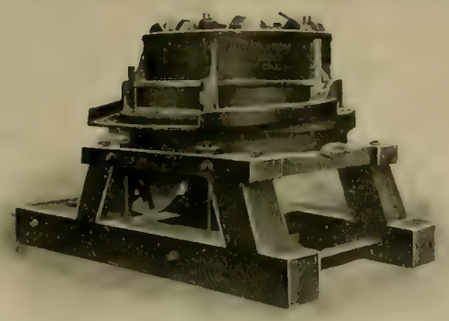
ORE MILLING AND SMELTING MACHINERY



F. I. W. HUNTINGTON MILL.

MILLING AND SMELTING MACHINERY.

We build Huntington Mills, in various sizes to suit all requirements. Special catalogue descriptive of these mills will be sent upon request.

We build a 3-stamp prospecting mill for preliminary work at mines, it gives the greatest satisfaction and is very reasonable in cost.

We build a 2-stamp standard mill, with 1000 lb. stamps that is an excellent proposition for parties having small capital but desiring to push work at their mines. Specifications and price on this mill will be promptly mailed to any one desiring same.

SMELTING PLANT BUILT BY THE FULTON IRON WORKS IN ARIZONA.

We build reduction machinery of all kinds for the treatment of ores. Crushing, grinding and sampling machinery a specialty. Let us figure with you for your requirements.

We design and build modern smelting furnaces and equipment including copper furnaces, copper converters, lead furnaces, reverberatory furnaces, roasting cylinders, slag carts, slag trucks, moulds, pots, forehearths, etc.

We are manufacturers under the patentees of the "Wright-McDougall" multiple deck-roasting furnace, the most successful and efficient roasting furnace on the market. Write for special descriptive pamphlet.

We have just issued our latest Smelting catalogue "Machinery and Equipment for the Smelting of Ores." If interested in smelting operations a request for the book will bring it to you.

Remember we are at your service to assist you in any way we can, our fifty years of successful business is our guarantee that we will treat you right. Command us.

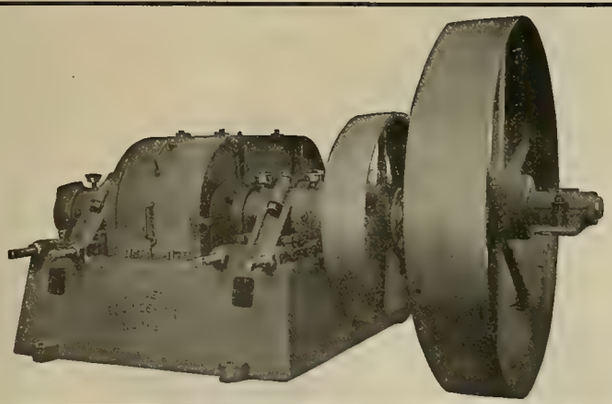
DENVER ENGINEERING WORKS'
CRUSHING ROLLS WITHOUT SPRINGS.



NO SPRINGS equals NO OVERSIZE
NO OVERSIZE " MORE PRODUCT IN LESS TIME
MORE PRODUCT " MORE PROFIT

"Things move along so rapidly nowadays that people saying, 'It can't be done', are always being interrupted by somebody doing it." — PUCK.

STANDARD RECRUSHING ROLLS

There are NO SPRINGS on Machines used in Rolling Steel Plates and Rails; there are NO SPRINGS on Ore Crushers; there are NO SPRINGS on Steam Shovels; and the shocks and strains on these machines are far greater than on Crushing Rolls under any condition of operation. The keynote of successful design in these machines is combination of strength and simplicity. Both of these factors constitute the prime feature of our Springless, Standard Recrushing Rolls.

By doing away with the complication of spring rolls, we are able to offer at a low cost a machine which is better in every way than the spring rolls. You are not experimenting when you specify springless Recrushing Rolls; they have been thoroughly tried out in service and have proven their superiority in every way.

If you are interested on this subject, send for our Bulletin 1019.

THE BEST WAY to Treat Slimes

is NOT TO MAKE THEM.

DO YOU KNOW that hundreds of thousands of tons of ore that defied concentration with the stamp mill have been successfully concentrated after being crushed in the KINKEAD MILL?

DO YOU KNOW that tens of thousands of dollars have been taken out of the waste dumps of the Bonanza Mines of the Comstock with this Mill: rock so low in value that it was used to grade the streets with?

DO YOU KNOW that thousands of tons of hard quartz from the lower levels of the Comstock have been and are being successfully treated by the Kinkead Mill to-day?

DOES IT INTEREST YOU TO KNOW that we are operating six mills and six concentrators with less than 20 Horse Power, and that as far as ease of installation, economy in power and wear, and in even quality of pulp delivered, is concerned, the Kinkead Mill is as far ahead of other mills as the Pullman car is ahead of the stage coach?

LASTLY, DO YOU REALIZE that crushing by percussion is wrong in principle, and that crushing by a pressure is the correct way?

IF YOU WANT TO KNOW MORE about what the Kinkead Mill can do, write us.

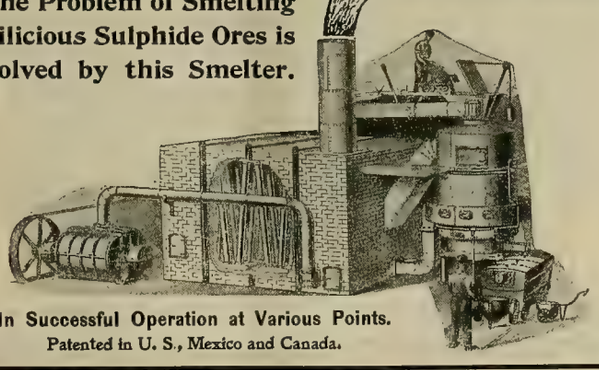
AT LAST

A SUCCESSFUL SULPHIDE SMELTER

The Problem of Smelting Silicious Sulphide Ores is Solved by this Smelter.



In Successful Operation at Various Points.
Patented in U. S., Mexico and Canada.

The MacDonald Smelter

SAVES THE PRECIOUS METAL VALUE AT LOW COST.

Especially Designed for Silicious Sulphide Ores Carrying Gold, Silver and Copper Values. Very Successful.

This Smelter is no experiment, having been in continuous and successful operation for nearly three years in Mexico on complex and refractory sulphide ore of low value. First a 40-ton plant was erected at El Oro, then two 60-ton Smelters, and in September, 1904, a 150-ton plant was put in operation and another 150-ton Smelter is being added. Metallurgists who have visited and inspected the Smelters in operation in Mexico report that they are doing more than we claim for them. One of our 60-ton outfits is now erected near Valardena, Mexico, by a Chicago company. A second Smelter of larger size is also contracted for.

DESCRIPTIVE MATTER COVERING EVERY POINT ON APPLICATION.

"THE ORIGINAL PNEUMATIC HAMMER DRILLS AS APPLIED TO ROCK MINING."

The Little Wonder Side Valve Drill

THE WONDER DRILL is a money saver, from the fact that it cuts more rock in comparison with the amount of air consumed than any drill you can purchase.

Hundreds of practical mine operators pronounce it a success, therefore you are running no risk whatever.

"The proof of the pudding is the eating."

Give us an opportunity to demonstrate the possibilities of the Wonder drill to you.

A HAPPY AND PROSPEROUS NEW YEAR TO ALL

The slogan of the Cameron — "Character: the grandest thing."

CAMERON PUMPS

The Claim — They are the most durable, effective, reliable, and economical in cost of maintenance, of any pumps on the market.

The Argument— Because they are of simple yet superior design, best material and construction.

The Proof — Over 40 years actual satisfactory service; more than 60,000 in use all over the world.

The Testimony— "If we knew of any better pumps we would certainly get them."

Cameron Vertical Plunger Sinking Pump

NOTE: The A. T. C. M. Co. have Nine in daily use.

The standard Sinking Pump the world over.

Height and distance limited by steam or air power only.

Few working parts.

No outside valve gear.

Robt. A. Kinzie, Supt.

Office of

Alaska Treadwell Gold Mining Co.

File No. 46

Subject: Inquiries.

Main Office Mills Building San Francisco, Cal.

Treadwell, Alaska, November 2, 1905.

A. S. Cameron Steam Pump Works,
Foot of East 23d Street,
New York City, U. S. A.

Dear Sirs:

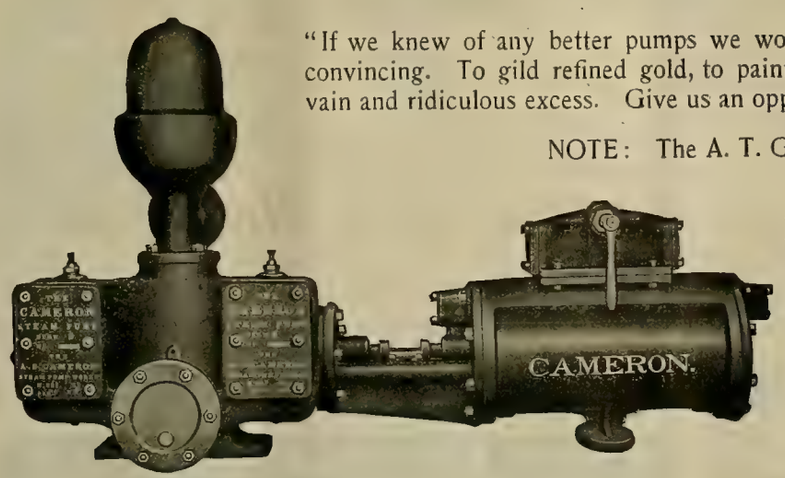
With regard to your letter of October 19th, you perhaps know that we handle very little water and most of this comes from the shafts in the process of sinking, and from our open works.

At present we are using in the Treadwell mine, two No. 5 and two No. 7 Sinking Pumps and two No. 7 Station Pumps. At the Mexican mine we are using two No. 5 Sinking Pumps and at the Ready Bullion mine, two No. 5 Sinking Pumps and one No. 7 Station Pump, and at the 700 Foot mine, one No. 5 Sinking Pump.

All the above pumps are giving satisfaction in the places used. If we knew of any better pumps we would certainly get them.

Yours truly,
ALASKA TREADWELL GOLD MINING CO.
By Robt. A. Kinzie.
General Superintendent

RAK'JOZS.



"If we knew of any better pumps we would certainly get them." Can we add anything more convincing. To gild refined gold, to paint the lily, or add another hue to the violet, would be vain and ridiculous excess. Give us an opportunity to demonstrate the truth to you.

NOTE: The A. T. G. M. Co. have Three in daily use.

Our catalogue "R" is a fine book, interesting and helpful, but we want to confer with you by letter or in person when you need a pump. Write us.

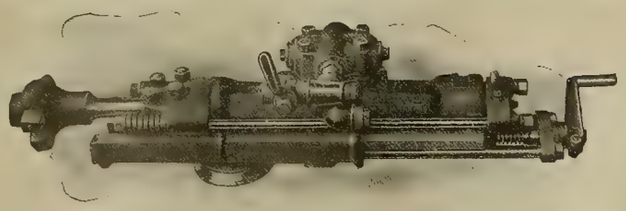
A. S. Cameron Steam Pump Works

Foot of East 23d Street

NEW YORK

Sullivan Drills

Reduce Mining Costs



Rock Drills do harder work and receive less care than any other class of mining machinery.

All parts of Sullivan Drills are of the best materials procurable; are subjected to rigid tests at every stage of manufacture, and are assembled with care and accuracy.

As the result, Sullivan Rock Drills are nearly "unbreakable," and require fewer repairs than any other make.

Send for Bulletin No. 101, describing the Destruction of Henderson's Point, N. H.

"SHOCKS THE ROCK ONLY."

A drill that will save you from one-third to one-half the money you are now spending for breaking rock.

The most effective, efficient and economical drill on the market. The plant costs you two-thirds less than others.

THE DEITZ ELECTRIC ROCK DRILL

does not shock the machine. It does not shock the operator. It is simple in construction and operation. The tremendous force of the shock is not transmitted to the mechanism. It does the work of an air drill of the same size and

COSTS LESS THAN ONE-THIRD TO INSTALL,

less to maintain, requires less than one-tenth of the power and will do the same work as an air drill of the same size at one-third the cost. Another strong point—it releases the piston from the driving mechanism before it strikes the rock.

PRICE F.O.B. "B" DRILL, COMPLETE AND READY FOR OPERATION, $650.
"C" DRILL, COMPLETE AND READY FOR OPERATION, $750.

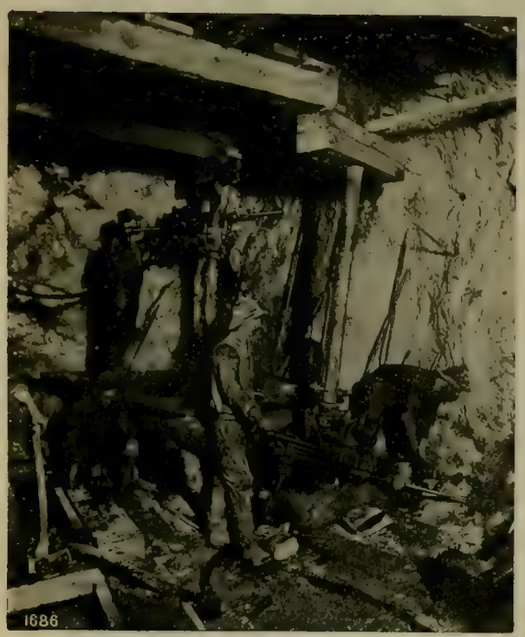
ROCK DRILLS

STANDARD OF THE WORLD



Rock Drills at Work in the "Original Mine," Butte, Montana.

Ingersoll-Rand Rock Drills have been adopted by the representative mines of the world, because of their superiority of design, and unexcelled material and workmanship. They are always selected where power, speed and endurance are essentials.

The endurance of a rock drill depends upon the materials composing it. STEEL PARTS of Ingersoll-Rand Drills are heated, after rough turning, to a high temperature, plunged in oil, cooled there, and then annealed, increasing the tensile strength 25% to 30%, and assuring freedom from internal strains. CAST IRON PARTS are made by a special process, ensuring a uniform product, and great strength and wearing qualities. MALLEABLE PARTS are of selected double-refined iron, tough, strong and free from flaws.

Gates Rock and Ore Breakers

Are used throughout the mining world

Our Style "K" Breaker

will reduce all kinds of rock or ore under all conditions

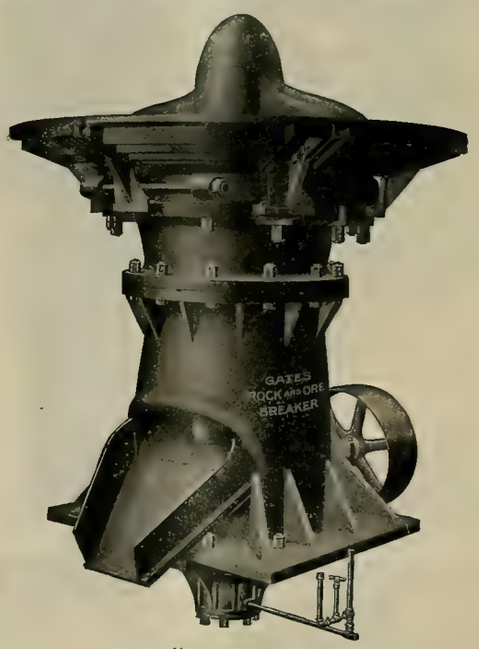
Has a greater capacity than any other breaker made

Will not clog in feeding

Is stronger, runs smoother, and consumes less power per ton of rock broken than any other breaker ever built

Is most convenient to operate

—Write for Catalogue—



Style "K" Gates Breaker

Don't Rot

your belts with frequent doses of liquid slush.

Modern practice among the leading belt makers is to discourage the use of all liquids and where necessary apply a very thin coating of

Stephenson Bar Belt Dressing

And see how simple it is.

No heating beforehand. Friction does that in the very act of applying "STEPHENSON."

We guarantee full speed with slack belts and that one pound of "STEPHENSON" does the work of three pounds of the 35c kind of liquid. 40c from $1.05 = 65c—quite a saving on a year's consumption.

Call on your dealer, or send us 2c for Free Sample, stating if for Leather or Rubber Belts. No ONE kind is good for ALL belts.

Preface.

To the Readers of the Mining and Scientific Press.—In taking editorial and business control of a paper so well established in the esteem of a large and widely scattered constituency, I feel the obligation due to those who have supported it in the past. It is my intention to maintain those features which have won deserved approval, and more particularly to observe the abstinence from malice and the fairness of criticism that have characterized its editorial comments during recent years.

In these days of quick achievement and passing reputation, it is no slight thing to succeed to the direction of a technical journal that is forty-five years old. Forty-five years in California goes back almost to the beginning of that complex method of life we call civilization; it marks the time when technical science commenced to give a helping hand to the energy and muscle of the pioneer; when the ancient and venerable rule of thumb became displaced by the logical methods of the engineer.

It is proper that a periodical devoted largely to the technology of the precious metals should be published in a State, the romantic story of which marks the dawn of that industrial development which has conquered a continent and consolidated a great people. It is fitting that the oldest mining paper in America should hail from San Francisco, where the westward wave of Empire rolled back and the foot of the Anglo-Saxon halted, after many wanderings, to make a country, the natural beauty of which should become the synonym for a happy home, a garden for the invalid, a rest-house for the worker.

San Francisco was a proper place of issue for such a journal, and more assuredly it is today the place for similar work. Not only is the whole mining region of the Sierra Nevada tributary to the City of the Golden Gate, but the railroad has knitted close the bonds that tie her to British Columbia in the north, to Arizona and New Mexico in the south, and in the east to the great Rocky Mountain States of Idaho, Montana, the Dakotas, Wyoming and Colorado. Furthermore, being the gateway of the Pacific, she has her ships that go up and down, from the Arctic goldfields in Alaska to the Tropic wealth of Mexico. San Francisco is the distributing point for a mining territory wider than any other where life and happiness meet.

Since May 24, 1860, when the MINING AND SCIENTIFIC PRESS was founded, the art of mining has grown beyond recognition; fundamentally it is the same, but it has made alliance with so many younger sciences that its homely features have been transformed. The plain digging for gold in the gravel of the stream, or the search for it in the quartz upon the hillside, has of necessity become a complicated process, requiring a trained intelligence and complex machinery, guided by the best that human understanding has evolved from thought and experience. The old energy and common sense are more necessary than ever, but when the miner once began to go deep below the surface and to extract the metal from minerals of complex composition, he had perforce to ask for all the help that Art and Science could give. As his needs have grown, so has the source of his help. The muscular metallurgy of the 'long tom' and the rocker, of the arrastra and the stamp, gave place to the physical chemistry of processes dependent upon advanced research; the plain mineralogy of the hammer and blowpipe was succeeded by structural geology and accurate surveys the immediate value of which has been incalculable.

In Europe a similar development occupied 500 years, in the West it required 50. Necessarily, there was much waste of money; there was a more regrettable loss of experience. Men made experiments which others had tried in vain, they repeated the blunders of their predecessors, nay, even of their contemporaries, simply because there was no method of recording them usefully. It is the mission of technical papers such as the MINING AND SCIENTIFIC PRESS to remedy this failing by affording an opportunity for thoughtful men to compare notes, to give information concerning their own work, whether successful or not, so that others may profit, and having profited, give a return in kind, by stating what they also have done. And beyond the mere interchange of data concerning current practice, such a paper as this ought to help in the crystallization of professional ethics and it should serve as a stimulant to that solidarity and *esprit de corps* which are essential to the engineering profession if it is to take its proper place in the world of today.

I confess to having but little liking for the mere manufacture of periodical literature designed as a lure for advertisements. The technical journal must have a better mission if it is to survive the present period of speculative publishing; on the contrary, I firmly believe that a paper which arouses the interest and stimulates the thought of technical men will receive such measure of support from them that those also who sell machinery will find it a remunerative vehicle for the offer of their merchandise. Therefore, the only test to which contributions will be put, is their interest and usefulness to the reader. While compression of language and conciseness of style is desirable in writing that deals with science and business, it does not seem to me that such writing should necessarily be made unattractive or that the human aspect of technical progress should be always eliminated. Man needs not only chunks of knowledge, like portions of solid meat, but also some of the garnishing to help assimilation and to prevent mental dyspepsia.

While I have a comrade's regard for the professional men who direct mining and smelting operations, I have also cordial respect, bred of intimate acquaintance, for the superintendents and foremen that actually carry out the work. The man behind the gun—in mining—is the shiftboss. I trust I may never write anything that a shiftboss, who cares to understand, cannot understand; and beyond such chiefs among the workers, I hope to meet the intelligence of all those that want to learn or care to discuss the ideas that underlie the arts of mining, milling, and smelting.

In the last issue of 1905, my predecessor in the control of this paper, and my friend, spoke of the transfer in terms that were an honor not lightly to be forgotten. I am glad to say that the name of Halloran will still be associated with the MINING AND SCIENTIFIC PRESS, for Arthur H. Halloran, the son, will remain on the editorial staff. D'Arcy Weatherbe, of Halifax, Nova Scotia, will join him within a month. The business department will be in the entire charge of Edgar Rickard, my cousin and formerly my professional associate. His knowledge of machinery, of the people that make it and the men that use it, will be invaluable. Neither he nor I shall practice our profession as mining engineers nor engage in mine promoting of any sort. It will be our ambition to win the aid and to deserve the support of those that are engaged in mining, smelting and the allied occupations, in the West first, and in the English-speaking world afterward. To such men we appeal with confidence for help in making the MINING AND SCIENTIFIC PRESS useful, to the betterment of practice, to the saving of experience and to the advancement of knowledge in its widest sense.

January 1, 1906. T. A. RICKARD.

EVERY improvement in the mail service is a distinct gain to the business world. The new mail trains going east from San Francisco connect at Omaha with express trains for Chicago and New York so as to carry letters from one coast to the other (3,500 miles) in 87½ hours, instead of the 103 hours formerly consumed in transit. A letter can be sent and a reply received within a few hours over a week. This arrangement is the result of negotiations carried on for several years between the officials of the railroads concerned.

THE management of the North Star Mines Company at Grass Valley observes a pleasant function each Christmas, holding a general gathering of its employees and presenting each one with a token of goodwill. This time miners received $10 apiece and the less skilled workmen $5 each. Those who injured their boots in the recent fire were presented with a new pair. The singing of carols and the making of friendly speeches gave an air of good-fellowship to the gathering such as goes far to establish the right relations between the staff and the employees. "Man's inhumanity to man" is the cause of one-half the labor troubles of the present day, and the North Star Mines Company is to be congratulated upon having established — and maintaining — a feeling of co-operation and kindness among the officers and men on its payroll.

BUSINESS houses at Guaymas report that they are suffering from interruptions caused by depredations of the Yaqui Indians in the State of Sonora, Mexico. The transport of merchandise has to be made by roundabout trails in order to avoid collision, and the general lack of security tends to interfere with industrial activity.

IN consequence of the rapid development of mines producing silicious ore, such as those at El Oro, Pachuca and Guanajuato, it is difficult for the Mexican smelters to procure a suitable fluxing mixture. As a result there is a tendency to return to the German practice, best typified by Mansfield, and to substitute the old Rachette furnace with brick lining in place of the water-jacket. The water-jacket robs the tuyere zone of 15 to 20 per cent of its heat, and it has become evident that if this heat, now lost, can be utilized, the silica can be raised to a tri-silicate condition. The formation of bi-silicate slags has not been accompanied by large losses, even with a small matte-fall, so that this new development promises to be of general benefit to the smelter and to the miner.

THE announcement made recently by the new British Premier that the importation of Chinese into the Rand will be stopped, is bound to have a most depressing effect on the mining industry of South Africa. Quotations on the Exchange have fallen, but not so much as might have been anticipated, simply because they have been drooping steadily ever since the termination of the Boer war and have now reached a point where business is almost at a standstill. The plan of introducing the coolies under indenture has added 45,000 to the laborers on the Rand, but it has not afforded the number required for all the enterprises under way. In the meantime this method of aiding mining activity has created a nasty political question in which the British Parliamentary parties have taken sides. This means an uncertainty deadly to confidence in South African mining investments, for with each change of party government the matter comes up for review and adjustment. While the production of gold will continue, and increase, despite these obstacles, the general effect is to cause investors to turn from South Africa to other countries, where the labor problem is solved, or has not yet come up for solution.

AMERICAN capital and energy are finding a profitable field in Mexico. In applying these motive forces to the development of the southern Republic, our countrymen are receiving hospitable treatment and kindly consideration at the hands of the native people; nevertheless, the traditions of the home land are strong and there is a disposition to form social communities of their own in the midst of the foreign life that environs them. It is pleasant to note how the technical men at such places as El Oro and Guanajuato interchange courtesies and meet for purposes of business or sport without those petty jealousies which often spoil the life of a mining camp. The American engineers maintain the solidarity of their profession and the Englishmen are just sufficiently numerous to sandwich a little healthy outdoor sport between the labors of the mine and mill. At Guanajuato there is a technical society, recruited from the staffs of the various mines, which meets every Saturday evening; it would be difficult to exaggerate the usefulness of such an organization in promoting exchange of ideas and mutual helpfulness. The Guanajuatenses had a flood that made their town celebrated, but more recently they were threatened by a social earthquake when they were promised the appointment of a colored gentleman as consular agent. The assimilative capacity of small Anglo-American communities in this regard is decidedly limited, and when a town has for representative of the American Government so honorable and capable a man as Mr. Dwight Furness, it is not to be wondered that trouble seemed imminent. However, that danger has, we understand, been passed and the business of Guanajuato will proceed on its even way. Good work is being done at El Oro and Guanajuato; some of the most capable men in the profession are there, and they are fortunate in being able to apply their skill to splendid mines and to metallurgical problems of the most fascinating kind. We wish them every success in 1906 and after. *Con Dios vayan ustedes, mis amigos.*

Cyanidation of Silver.

On another page we publish an article on the treatment of silver ore by the cyanide process and in subsequent issues we shall afford our readers further information on this subject. It is curious how long the successful treatment of silver ore has been delayed, pending the pursuit of economy in the extraction of gold. In its early days, it was claimed that potassium cyanide could extract both of the precious metals equally well, but the results of practice negatived the assertion. Within the last two years Griffiths, Oldfield and Oxnam at Palmarejo, and Hamilton, Hobson and MacDonald at Guanajuato, have experimented so successfully on silicious ore containing silver in sulphide form that the process has become established as an economic success. It appears that while the employment of extremely weak solutions of potassium (or sodium) cyanide is beneficial to the reduction of gold ores, it was prejudicial to the silver, and recent success is largely due to the recognition of the necessity for stronger solutions and more time, conditions which in themselves illustrate the selective activity of the chemical. Experiments on a large scale have demonstrated that even a vanner concentrate, containing silver sulphide associated with pyrite, is amenable to profitable treatment. This is something that was tried in vain less than fifteen years ago.

The Mexican Peso.

There has been much confusion, some of it costly, by reason of the use of the term 'dollar' in Mexico. Those who live in our neighbor Republic are apt to forget to prefix the adjective which indicates that they are writing in terms of Mexican currency, and only recently the costs of cyaniding at Palmarejo astounded a foreign metallurgist who did not recognize the fact that the author was dealing with a depreciated coinage. Most of us who have felt astonishment at the output of the old mines have been relieved to find that we could divide the statistics by two, in order to bring them to our own basis of comparison. It is tiresome to be always writing 'Mexican' after the figures giving prices, outputs, or dividends of mines in the country of Diaz; therefore the word is apt to be omitted, to the frequent confusion of those who are not alive to the omission.

All this is now changed. By a recent law the word 'peso' becomes the proper word for the unit of Mexican currency and there is no longer any excuse for using that of the United States. The new law reads:

"The theoretical unit of the monetary system of the United Mexican States is represented by 75 centigrams of pure gold and is denominated a 'peso.'

"The silver 'peso' which has hitherto been coined with 24.4388 grams of pure silver will have, on the conditions provided by this law, a legal value equivalent to the said 75 centigrams of pure gold.

"The alloy of the silver coins will be: For the 'peso' 0.9027 of pure silver and 0.0973 of copper; and for pieces of less value 0.800 of silver and 0.200 of copper."

Hereafter the 'dollar' and the 'peso' will have their respective duties, and anyone speaking of "Mexican dollars" will do so at their risk. It is a fact that a check made out in Mexico City for so many 'dollars' was paid by the bank at the rate of exchange for American dollars, or twice as much as the signatory of the check intended. On appeal to the courts, he lost; and thereby learnt a lesson from which others have taken warning.

The MINING AND SCIENTIFIC PRESS will be careful to employ 'peso' in all statements dealing with Mexican currency, and it will do its utmost to prevent a confusion (with the American dollar) which has been a standing nuisance so long.

In this connection we publish a conversion table for measures of silver. Among those who take an interest in Mexican mining are men of many nationalities, to whom the 'pound sterling,' the 'dollar' and the 'peso' are terms requiring conversion, when writing concerning the value of silver, whether as bullion or in the ore. The table gives the equivalents for the Troy ounce and the metric kilogram for silver prices ranging between 50 and 70 cents, a minimum and maximum not likely to be exceeded for some time to come. We hope the table will prove of service.

Gold and Silver Production.

On another page we give the preliminary statistics for the gold and silver produced by the States and Territories during the year just ended. The United States, as a whole, exhibits an increase, slight in the case of silver, but noteworthy ($6,000,000) as regards gold. This advance is due mainly to Alaska, where the Tanana district has yielded $5,107,000, exceeding the output of Nome and making it one of our premier goldfields. Colorado more than holds her own, by reason of the continued productiveness of Cripple Creek. Despite the activity in dredging, California exhibits a small decrease, due mainly to the drought, which curtailed milling operations. Utah and Nevada show progress. The silver statistics indicate that Colorado is losing ground slowly by reason of the exhaustion of the old mines at Leadville, while Montana is getting the benefit of the tremendous activity at Butte, where silver is produced as a by-product in copper mining. The ascendancy held by Colorado ever since the discovery of Leadville has now passed to Montana. Utah's production is steady, by reason of the continued prosperity of the big mines at Park City. Idaho has increased her silver output, in consequence of the greater yield from the lead mines of the Cœur d'Alene. In general, these preliminary figures indicate the healthy condition of precious-metal mining in the United States. Silver mining has benefited directly from the better market for that metal, the price averaging 61 cents for the year, but the indirect stimulus to both the mining of gold and silver by reason of the rise in the value of both copper and lead has been the dominant factor in increasing mining activity throughout the country.

Engineers and Geologists.

It is our intention to encourage discussions on matters appertaining to the work of the miner, millman and smelter. A department, on the fourth page, will be kept for this particular purpose. This week the only contribution is one dealing with a subject which has been much to the front during the last two years. The letter on 'Mining Engineers and Geologists' is written by a contributor for whom we have the highest regard; we have also a good deal of sympathy for his point of view, without endorsing it entirely. Engineers who dabble in geology have made sad messes occasionally, as have geologists who ventured to appraise mines; but we deprecate anything like antagonism between men who ought to be united by their avowed purpose, the ascertainment of truth. Some day we may have men who combine both geological training and mining experience; indeed, if we are rightly informed, several such are already available. They stand between science and industry, combining the knowledge essential to both, as the architect stands between the artist and the building-contractor.

As regards mining, a geological investigation which is divorced from sampling or the knowledge of the commercial value of the parts of an ore deposit, is, of course, useless to the investor. It is magnificent, perhaps, but it is not business. Similarly, there are mines in which geological structure, particularly faulting, plays so important a part in determining the distribution of ore, that the sampling of the stopes and levels, without an eye to the geological facts, is likely to be futile, as an appraisement of the value of a mining investment. The first duty of a technical man is to learn what he does not know—a wide field of knowledge, you may say, but it is a fruitful one. Then, when he meets with conditions beyond his ken, let him say so—to himself; occasionally to his client, if he is the right kind of man. There are many mine examinations which to be correct diagnoses require the combined work of the engineer and the geologist. The larger financial houses and the big mine-operators know this. We are among those who welcome the tendency for large mines to engage the occasional special service of a trained geologist, just as we like to see them utilize the services of expert metallurgists to solve special problems. We hold, however, that men devoted to science and unacquainted with business are rarely safe guides in an affair such as the valuation of a mine, because it is work which demands the experience obtained in the actual management of mines. An artist is not a fit valuer of a building, much less of a building site.

CONCENTRATES.

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and to give information dealing with the practice of mining, milling and smelting.

CRYOLITE is a fluoride of sodium and aluminum. It contains aluminum 12.8%, sodium 32.8%, fluorine 54.4%.

♣♣♣♣

OPALS have been found at several places in Idaho, mostly in trachyte, the best coming from Panther creek, in Lemhi county.

♣♣♣♣

THE diatoms in infusorial earth are very minute, and can only be seen by the aid of the microscope. They present many forms, some of which are very beautiful.

♣♣♣♣

SMALL ore deposits often accompany intrusive feldspathic veins, in metamorphic rocks. Usually these bunches of ore are of limited extent, and, though rich in metal, are of little value.

♣♣♣♣

PLACER gold is usually not worth over $18.50 per troy ounce. The gold from the placers of Juarez, Lower California, however, is worth over $20 per ounce, being almost free from impurities and unalloyed with other metals.

♣♣♣♣

A BELT conveyor about 250 feet in length is used to transport ore from one of the shafts at the Homestake mine to the nearest mill. At other shafts the ore is sent to the mills in trains drawn by compressed air locomotives.

♣♣♣♣

GOLD was first discovered at Leadville, Colo. (then called Oro City), in 1860. It was not until 1876 that it was recognized that the heavy boulders and sand, which had been the bane of the placer miners, was lead carbonate rich in silver.

♣♣♣♣

A WELL boring outfit is the best thing to employ to sink through gravel. In this process casing is driven to prevent caving of the hole. When bedrock is reached if it is desired to prospect deeper the diamond drill may be substituted to advantage.

♣♣♣♣

IN some regions where greenstone schists predominate, the country is cut in every direction by white quartz veins showing no mineralization. It is seldom that veins of this character are gold-bearing, though in the same region there may be fissure veins containing pay ore.

♣♣♣♣

'CONCENTRATES' knows of no mineral assaying 20% aluminum and 17.77% oxygen. The remaining constituents of the mineral are not stated. The minerals containing aluminum which are of commercial value carry 50% or more of aluminum. Among these are bauxite and corundum.

♣♣♣♣

THE first recorded discovery of bauxite in the United States was made near Rome, Georgia, in 1887, though the first production of that mineral was from deposits at Hermitage, in Floyd county, Georgia, in 1889. Georgia and Arkansas are at present the principal producers of bauxite in the United States.

♣♣♣♣

TIMBERS for mine shafts should be selected with a view to both their strength and enduring qualities. Where the shaft is sunk on the vein it is nearly always Some kinds of rock require heavier timbers than others. advisable, if not necessary, to use heavier timbers than where the excavation is sunk in the country rock.

♣♣♣♣

THE hydraulic gravel elevator is used to work wet placer ground situated below the level of the surrounding drainage. It is also used in some localities to work ground, the head being artificial——produced by pumping. The situation and the value of the gravel must determine the method of mining to be adopted in each case.

♣♣♣♣

WHERE chalcopyrite or other copper sulphide ore occurs, disseminated in a mass of decayed rock, as in diorite or granite, the ore is usually a good concentrating material, and should be so treated unless occurring in sufficient abundance in the rock to make it economy to send it to the smelter direct without attempting hydraulic classification and mechanical concentration.

♣♣♣♣

WHERE work is done on an unpatented mining claim, by those holding a bond on such claim, this work may be considered as the annual assessment work, to the extent of $100 for each claim, but where the work is done by such parties after the expiration of the bond, the work cannot be counted as assessment work for the reason that they are as strangers, having no legal rights upon the ground. The work must be done by the claim owner, or be done at his instance.

♣♣♣♣

THE smoky quartz crystals for which Colorado is famous come from Pikes Peak, in a coarse granite. The large colorless transparent quartz crystals of California were all found in a small area in white rhyolite tuff in an ancient river channel in Calaveras county, about 1 mile south from Mokelumne Hill. It is supposed they came from a cave or pocket lined with these gigantic crystals, some of which weighed over 100 pounds, but the original source has not been discovered as far as known.

♣♣♣♣

TURQUOISE occurs in brecciated trachyte, in veinlets and small irregular masses. The stone is hydrous phosphate of alumina. The delicate blue color is due to the presence of a small amount of copper. Some varieties are green. These are not of value. In some blue kinds the color fades to a peculiar green, which destroys their value as gems. It is not an unknown practice to artificially treat very lightcolored and comparatively worthless varieties of turquoise to give them a better color, but this is not enduring.

♣♣♣♣

BY metamorphosing processes limestone is altered to a variety of rocks, principally silicates, the process being one of simple silicification. The silica originally present in the limestone, or infiltrating into it from ground waters, replaces the carbon dioxide and forms silicates. Where the original rock is pure limestone wollastonite forms. If the rock be dolomite, diopside or tremolite is the usual result of silicification. Garnet, tourmaline, hornfels, serpentine, olivine, pyroxene and other minerals also form from the silicification of limestone.

♣♣♣♣

THE gold content of amalgam can only be judged approximately by those familiar with that particular amalgam. The percentage of gold decreases with the fineness of the particles of gold. That which is very fine contains less gold per ounce than that where the golden grains are coarse. The amount of silver present is also a very important factor. Amalgam from the ores in different parts of the same mine, particularly if from different shoots, will vary considerably in value for a given weight. Ordinarily, hard squeezed amalgam will contain from 25 to 35 per cent of its weight in gold, but the amount varies greatly.

♣♣♣♣

A CITIZEN of the United States may locate as many claims on one lode as he cares to perform the assessment work on, and he may re-locate as many claims abandoned by others as he may find, either on one lode or on several lodes. No claim can be located by a stranger on agricultural ground, and the owner of an agricultural patent is not required to locate a vein or lode which he may discover on his own land, but he has no rights beyond the vertical boundaries of his property. Before a patent issues for a placer claim, the land department requires that proof, consisting of the affidavits of two or more witnesses, should be filed showing that there are no known lodes, or veins, within the tract applied for. This is the law and it must be followed. No one can enter a patented placer location and locate a vein not known to exist before the application was made for the placer patent.

♣♣♣♣

THE question having been asked: "Where in the Western States is at present the best place to prospect during the next three months?" 'Concentrates' would suggest that southern Nevada and northwestern Arizona and southern California at present offer the best inducements to the prospector, for several reasons. First, there is a large area in that desert region not thoroughly prospected, owing to difficulties of transportation, and scarcity of water; the former is, however, being simplified by the construction of railroads, and the establishment of near towns and mining camps in that region from which the prospector may radiate with more safety than heretofore. Second, the ores are often high grade and can be shipped to distant points for reduction, rendering mills or other reduction works unnecessary. Third, any promising prospect in the region above referred to could readily be sold at a proper price, owing to the unusual interest at present being taken in the mining industry there. Fourth, it is the best part of the year to prospect in the desert, the weather being generally fine and water more abundant than during the summer months. Outfits can be bought at any of the larger towns in the region, which relieves the prospector of the necessity of packing tools, provisions, etc., into the mining region.

♣♣♣♣

CONCERNING a 'vein apex' the Supreme Court of the United States said in the Flagstaff case, Flagstaff v. Tarbet, 98 U. S. 463, No. 469. "We do not mean to say that a vein must necessarily crop out upon the surface in order that locations may be properly laid upon it. If it lies entirely beneath the surface and the course of its apex can be ascertained by sinking shafts at different points, such shafts may be adopted as indicating the position and course of the vein, and locations may be properly made on the surface above it so as to secure a right to the vein beneath. But where the vein does crop out along the surface, or is so slightly covered by foreign matter that the course of its apex can be ascertained by ordinary surface exploration, we think that the act of Congress requires that this course should be substantially followed in laying claims and locations upon it. Perhaps the law is not so perfect in this regard as it might be; perhaps the true course of a vein should correspond with its strike, or the line of a level run through it; but this can rarely be ascertained until considerable work has been done and after claims and locations have become fixed. The most practicable rule is to regard the course of the vein as that which is indicated by surface outcrop, or surface explorations and workings. It is on this line that claims will naturally be laid, whatever be the character of the surface, whether level or inclined.

♣♣♣♣

QUARRIES and mines are in many respects much alike. A mine is usually considered an underground excavation, while a quarry is open to the air and sunshine. Breaking rock for macadam in an open pit is essentially similar to breaking gold, or copper, or any other ore in open cuts, but quarrying proper generally requires that the stone be taken out in solid masses. Slate, for instance, is quarried in good-sized blocks, and split and trimmed afterward. Granite is quarried in blocks, often breaking in shapes approximately rectangular, but frequently it is taken from its place by what is known as channeling——that is, a continuous cut is made by means of channlling machines and the blocks broken out in any desired size from the large mass. In other quarries the 'feather and plug' method is employed, and in very large quarries great masses are split off from the main mass by what is known as the Knox system of blasting, which consists in drilling two holes to the depth of several feet, these holes being a few inches apart and directly on the line along which it is desired to fracture the rock. These holes are shot repeatedly with black powder which results in riving the granite block in the desired direction. Sandstone, marble and similar structural materials are quarried in much the same manner. Ores are broken down in great masses, the only regard paid to stratification or jointing planes being their effect on the quantity of ore which may be broken with a single shot, or series of shots. Massive rocks often break better than those that are stratified.

♣♣♣♣

THE advantages claimed for machine drills of small piston diameter (2 in. and 2¼ in.) is that they use smaller steel and consequently a smaller bit, the drill cuts faster and thus saves time in reaching a given depth. Smaller powder cartridges are also employed. These smaller machines are well adapted to medium hard ground where large charges of powder are not required. Should the rock require more than ordinary force in blasting, No. 1 powder containing 70% nitroglycerine may be used. This grade of powder has nearly 100% greater disrupting force than the ordinary No. 2 powder. It also has the advantage of having the explosive concentrated near the bottom of the hole, thus decreasing the tendency to blow off the collar of the hole, leaving a foot or more of drill hole, the time spent in drilling which may be thus wasted. This frequently happens where holes are overloaded with lower grades of powder. Under ordinary circumstances all of the powder should be in the lower half of the hole and none of it in the upper half, and the primer should be placed in the upper stick, and not near the bottom, which latter practice is likely to result in setting fire to the charge, which then generally burns instead of exploding, creating an unnecessarily large amount of gas. Large drills are to be preferred where the rock is very hard and tough, and where heavy blasting is desirable, as in large stopes and shaft excavation, where time saved rather than economy in cost is the chief object. Some engineers prefer hand work in shafts on the ground of economy, but where large capital is invested and the interest charge is consequently high, speed in work may prove more economical than lower cost per foot of work accomplished where the interest charge is not an important factor.

♣♣♣♣

CONCERNING cross veins or lodes the Federal statute, section 2336, says, "Where two or more veins cross each other, priority of title shall govern, and such prior location shall be entitled to all ore or mineral contained within the space of intersection; but the subsequent location shall have the right of way through the space of intersection for the purpose of convenient working of the mine. And where two or more veins unite, the oldest or prior location shall take the vein below the point of union, including the space of intersection." In reviewing the several important cases in various States arising from cross-lode litigation, Lindley on Mines says: "All courts now agree upon the following propositions: The grant to the senior locator is of all veins found within his location regardless of their course, and whether they were previously known to exist, or were blind and undiscovered. There is no limitation implied and the grant is exclusive. A junior cross-lode locator has no right to any ore found upon the cross-vein within the boundaries of a senior claim. 2. The owner of a junior tunnel-site cannot by means of a crosscut tunnel penetrate within the boundaries of a senior claim for any purpose." As to what rights of way the owners of junior located veins may have as against senior claimants where the veins intersect or cross, it may be said that all courts agree that where two veins cross on their dips, the senior takes all the ore in the space of vein intersection, and the junior has a right of way through the space. The same may be said of veins crossing on their strike or course where there is no surface conflict between the locations. But where there is a surface conflict, and there are cross-lodes and cross-locations, there is a disagreement. In Colorado and Montana the junior cross-lode claimant has a right to drift through the senior claim, following the cross-vein, yielding the ore encountered to the senior locator. In California and Arizona he has no such right. Until the Supreme Court of the United States finally approves one or the other of these views each State and Territory will be left to determine which of the two conflicting rules is best supported by logic and reason.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy.

MINING ENGINEERS AND GEOLOGISTS.

The Editor:

Sir—The old question has cropped up again. A distinguished geologist has recently crowned himself with a halo of self-approval and has pictured the poor engineer as an unadorned creature busy with the commonplace "questions of measurement and equipment"—dealing, as it were, in the chores of mining, while the other man is dispensing the refinements of the same art. Why cannot the so-styled 'mining geologist' recognize that all mining engineers of any reputation, while they do not specialize along geological lines, yet have by training and by experience in the mining field acquired geological information which they can, and do, apply in a practical way wherever geology enters into the practical considerations of mining?

Because the man of lesser technical education describes some porphyry intrusion in common mining parlance instead of using such language as "product of igneous magmatic emanations disbursed through fissures in the adjacent matrix," that does not disqualify him from the mining engineering profession, nor does it gainsay the possibility that the man of smaller words may have sound geological sense and geological experience as applied to mining. With all due respect to the splendid work that the professed scientist—particularly the geologists of the Survey—has done, I feel sure I am voicing the opinion of others of the profession when I say there is too much of a tendency in geologists of academic training and limited practical mining experience to put themselves on a pedestal and arrogate to themselves some peculiar quality through which one is supposed to be impressed with the idea that they alone are fitted to pass upon the merits of a mining undertaking, and that they by nature were intended to occupy the middle ground between the practical miner and the man of capital.

There are geologists, consulting geologists or mining geologists or whatever the style, who, combining the geological with the mining profession, go into print and illustrations *in report form* descriptive of a mine, with the design of passing upon geological questions pure and simple and with the idea of avoiding altogether the commercial question—the question of values and operating costs—and the question of profit and loss. It is a matter of fact and incontrovertible that these same reports are sometimes used in questionable promotions, in cases where a report dealing plainly with measurement and equipment, and concrete facts generally, would neither be published nor circulated in prospectus form. Further, the misuse of geological treatises in mine report form is not under the control of the geologist (no matter what may have been the original purport of such report) and a favorable expression concerning matters more or less superficial may become deceptive through the omission of any reference to the economic question. The irresponsible promoter is quick to make use of such a circumstance.

Mining engineers who are not afraid to meet the commercial question, and are not in the habit of avoiding references which may be inconvenient to the owner and promoter, can prevent the waste of money in explorations which are directed without any practical understanding of the *business* of mining, and they do not hesitate to stop the squandering of money where there is no hope of profitable return. To take one's theories into the mine and work them out in the mine, to supply the gauge of the sample, the assay-office, and the tape, to take into account the many other considerations equally important, to face the question of profit-and-loss without prejudice and without compromise, and finally, to give something more than an ambiguous expression to one's conclusions, is the thing that makes mining engineering respected as a profession.

In the judgment of many men who are doing important mining work it is of less importance to follow the "particular branch of geology pertaining to the laws of ore deposits" in any college than to enter into the practical considerations of mining, first and last. The 'mining geologist' with the halo would do well to come to considerations which have a much more practical bearing on the mining proposition as a whole than speculation as to the origin of the orebody and geological considerations which are so far beyond the intelligence of the mining engineer as to come within the particular domain of the 'mining geologist.' It is for him, not the mining engineer, to "awaken to the importance of the subject," and to realize that when he seeks to give theoretical considerations more prominence than the practical considerations, such as the sampling and estimation of ore, he is going on a false trail which leads him away from the essential commercial factors which are all-important to the man who is contemplating an investment in legitimate mining enterprises. There is such a thing as using the microscope too much and the telescope too little.

FORBES RICKARD.

Electricity vs. Compressed Air for Mine Operations.

By W. R. HULBERT.

Compressed air has been the recognized medium for the transmission of power in mines for a good many years, and its use for this purpose has been growing rapidly—so rapidly indeed that a large number of engineers and mine operators probably believe that no other power will be able to displace it. It is the intention of this article to dispute such a theory and to show how many and varied are the advantages which electricity presents over compressed air when used in mining.

Probably no one would care to contradict the statement that electricity is more economical to produce. The losses in modern electric generators have been brought to a minimum, while losses in air compressors, although greatly reduced within the last few years by two-stage machines, still form a comparatively large percentage of the total power.

It is in the transmission of the two mediums, however, that electricity presents its great superiority. The total losses in an electric circuit are represented by a drop in the potential of the line and seldom exceeds 1 or 2% in installations involving comparatively short distances. With compressed air installations, however, the transmission losses usually represent a large amount of power and increase at a rapid rate with the number of elbows, valves, and pipe-lengths which are used. There is no increased drop from the effect of sharp turns in electric installations, while with compressed air systems each elbow and valve represents, approximately, the addition of an entire length of pipe to the system. Beside this there is nearly always a large leakage and a great increase in the expense of installation, since wrought iron pipes, with the necessary valves and fittings, are an expensive proposition to instal and keep in repair.

One of the important advantages claimed for compressed air in mines is that the exhaust may be used for ventilation. Let us examine this carefully and see how much of an advantage it really is. In the first place I quote from the report of the Miners' Phthisis Commission of the Transvaal as follows: "The composition of compressed air, shown by analyses, has revealed the very great danger that attends the use of inferior oils (or oils of low flash point), for the lubricating of the air cylinders of the compressor engine. The analyses of the compressor air show that in some of the samples carbonic-oxide gas was present in sufficient quantity to be extremely dangerous to health." It will be seen from the above that while compressed air rock-drills undoubtedly ventilate the mine with their exhaust, yet the ventilation so obtained is apt to have a bad effect on the health of the workmen. Furthermore, ventilation obtained in this way is, to say the least, an expensive luxury; it means that air under 60 to 80-lb. pressure is allowed to escape into the mine, while, as a matter of fact, air under the pressure of a few ounces would do the work just as well and would be far better for the health of the miners. It is a well-known fact that the modern compressed air rock-drill does not use air expansively, in fact it is almost an impossibility for it to do so without freezing up the exhaust ports. This being the case, it means that air which has required a large amount of power to compress is being practically thrown away when it possesses a potential value represented by the amount of work which it would do if expanded to atmospheric pressure. A small electric blower, requiring less than one-thirtieth the power required to operate a 3-in. rock-drill, will effect all the ventilation which would be accomplished by the exhaust from the drill.

Aside from the fact that an electric rock-drill does not waste a large amount of power on so-called ventilation, it possesses advantages in the way of lighting, it being possible to connect incandescent lamps to the circuit which is furnishing power to the drill.

Another drawback to the compressed air-drill, and one which is probably least understood, is the fact that it requires increased power to compress, at an altitude, an amount of air which will be equivalent in effect to a given amount at sea level, this increase averaging about 2% for each 1,000 feet of altitude. This is an item that ought to appeal to owners and operators of Western mines, which are usually situated at high altitudes, and provides an excellent argument for the use of electrically operated rock-drills.

In general, it may be said that a 3½-in. electric drill will only consume from 2½ to 3 h. p. against 15 h. p. for an air-drill of the same size. Taking into consideration also the fact that electricity is more economical to generate and transmit, it would seem as though there ought to be a large field for its use in the mining industry in the future. The very fact that it has driven everything before it in the industrial field ought to be proof enough of its fitness for work in mines and quarries.

IN DIAMOND DRILL BORING a solid core of rock is removed in sections, enabling accurate determination of the character of the rock formation throughout the depth of the bore, and this without the great expense of sinking a shaft. On the gold-bearing reefs of the Transvaal borings of great depth have been made, the two deepest recorded being each more than 1 mile—5,582 ft. in that near Johannesburg, which required nine months for sinking, and 5,560 ft. in the one near Doornkloof, the boring of which occupied 14 months. In each case the core removed from the boring had for the greater part of the depth a diameter of 1⅞ in. It is interesting to know that the machinery used in the South African fields for this work is nearly all imported from the United States.—*Iron Age.*

Tales of the Desert.

Written for the MINING AND SCIENTIFIC PRESS by GEORGE J. BANCROFT.

By reason of deficient rainfall a large part of the West and Southwest is barren. This region is called the Desert. The lack of water is being remedied, in places, by irrigation, so that many million acres have been won to cultivation. But with all the desert's potentialities as an agricultural region, it is the mineral deposits that always did, and always will, best encourage development.

Prospecting in the Desert.

There is one portion of the desert which seems to have been reserved by some supreme power for the present generation to exploit. This is the most arid part embracing the Mojave, Colorado and Red deserts and the Death Valley country. It seems that every single prospector who made a discovery in this tract prior to the last decade, and tried to work his find, paid for it with his life. There was 'Peg Leg' Smith who set out in 1884 to travel from Yuma to San Diego. He lost his way and found a gold deposit of extraordinary richness; finally, he reached Los Angeles more dead than alive, but with his pockets full of nuggets. Prospector-like, he proceeded to go on a grand spree as soon as he had recovered from the effects of his trip. When the gold was all gone, he borrowed a horse and slipped away in the night, returning in five days with six tobacco-sacks full of gold, and again went on a spree. He kept this up for some time, and several attempts were made to follow him; all but two men lost his trail in the desert, and those two never came back. Finally Smith agreed to take a friend with him on his next trip. He went on an unusually heavy debauch and died of alcoholism before he could even describe the location.

When the Southern Pacific grading camp had reached a point near Gloster on the Mojave desert a squaw struggled into camp one day with her mouth swollen from thirst and the fever of death upon her. The grading foreman took care of her and nursed her back to life. When she recovered she produced a buckskin bag with about $5000 in gold and gave it to the foreman. To all entreaties she refused to tell where she got it. She said her 'buck' had died from thirst on the desert and that the Great Spirit did not want the white men to know where the gold came from. At last accounts she was living with her tribe at Yuma and still preserved the Great Spirit's secret.

In 1894 the men who drive the borax wagons picked up a prospector at Six-Mile Station and brought him into Mojave. His name was Golder. He was an old man and he was crazy from thirst and nearing death. In his pockets were three gold nuggets which had a total value of $3654. He became partially sane before he died and tried to draw a map and show where he got the gold. He said he had been out of water for three days and his burros could go no further, so he unpacked them and turned them loose; he then climbed to the top of a high hill which was just north of where he left the burros. From the top of the hill he saw trees about five miles away and started for them. Just as he left the top of the hill he stumbled over a gravel bed full of gold nuggets. He was too far gone to stop to gather many, but he picked up the three biggest and put them in his pocket. He went to the water and drank too much and it made him crazy. After that he remembered nothing until he was picked up by the borax team.

Such was his story. Of course there was a stampede and the packs and burros were soon found. The burros were dead. The hill to the north was just as Golder described it, but no trees were visible from its summit and no gold was found just over its crest. There was no water in that direction nearer than Red Rock, which was 25 miles distant. The man had probably been out of his mind part of the time for days and there is no telling when or where he found the gold.

Sometime in the 80's a prospector named Breyfogle came into Austin with specimens of gold-quartz literally hung together with wire-gold. He described a large vein of it as existing near Death Valley. A party of his friends was organized at once and set out for the find. When Breyfogle got down to the vicinity of his find he became confused and could not identify it. His party lost faith in him and accused him of being an impostor. Finally they left him with a very little food and returned to Austin. Breyfogle continued his search, going into the Ash Meadows ranch occasionally to beg a little flour. One day he came in exultant. He had re-discovered his mine and had a large sack of the fabulously rich stuff. He was sick and famished but insisted on starting at once to carry the good news to his friends at Austin, so the ranchman started with him. Breyfogle became suddenly worse on the third night out and died before he could tell the ranchman where to find the mine.

The new camp of Bullfrog is near Breyfogle's country and some recent strikes made in the Funeral range are said to be in the very locality where Breyfogle camped.

About the time of the Breyfogle episode two men came into Keeler and disposed of several hundred dollars worth of coarse gold. They apparently had a great quantity tied up in bags. They said they had had an awful time; that their partner had died; that there was a curse upon the land and that they would tell no one where they got the gold, that they were going to return to their farms in the middle West and never again venture on the desert. They left no names or address.

In the summer of 1869 the party of Abner McKeever was massacred by Apaches at the big bend of the Gila near Camp McDowell, in Arizona. McKeever's pretty daughter, Belle McKeever, was carried away as a captive. A party of soldiers gave chase. The Indians separated in many bands and the soldiers were obliged to do the same. The party taking the most westerly trail consisted of Sergeant Crossthwaite and two privates, Joe Wormley and Eugene Flannigan. These three men followed the Indian trail till two of their horses perished with thirst and all their provisions were gone. They took some of the flesh of the dead horses and under Flannigan's leadership struck out north for a range of low hills, as they supposed east of the Granite Wash mountains, where Flannigan had seen signs of water. They found water only just in time to save their lives, but not soon enough to save the reason of Wormley, who had gone mad. Next morning Flannigan went to the spring for another drink and found the gravel was full of large nuggets of gold. He traced the gold to two veins which crossed the gully. One of these was narrow, the other about 16 feet wide, both veins were composed of honeycomb quartz showing coarse gold plentifully scattered through it. The three soldiers gathered all the nuggets they could scratch up with their hands and some of the richest pieces of rock, about 50 pounds in all. They loaded this on their one remaining horse and set out for the Gila river. The last day they became separated. Crossthwaite died on the desert; Wormley reached the river and was found by some officers who straightway set out to find his companions and picked up Flannigan, who was out of his head by this time. Wormley eventually recovered his reason but could never recall anything at all of this terrible trip and the wonderful discovery of gold. When Flannigan recovered his reason and began to tell of the wonderful discovery of gold his story was so hard to believe that it was thought he still retained a mad streak due to his awful sufferings. But a few days later the horse was found dead on the desert with the gold ore still strapped on his back and $1800 was realized from the sale of the 50 pounds of quartz. Crossthwaite's body was also found, and on it was a map showing the position of the discovery. Flannigan made several attempts to return to his find, but he was always timid about venturing far from the river, and then again he always relied on Crossthwaite's map, which was probably all wrong. Flannigan finally died at Phœnix in 1880.

A Desert Mining Camp.

So go the tales of the desert. Nowadays automobiles and frequent wells make the worst journey of all, that across the Ralston Desert, a matter of a few hours' pleasant spin. Death Valley has several thriving farms and is an ideal place to raise oranges and lemons. Mining camps are springing up all over the driest country; truly this is the day of the desert.

Structural Features of the Ontario Mineral Belt, Park City, Utah.

Written for the MINING AND SCIENTIFIC PRESS by WALTER P. JENNEY.

From the higher peaks of the Wasatch range, where rise the American Fork and the Big and Little Cottonwood creeks, the great mineral belt stretches east nearly to the valley of the Provo river. The explored length exceeds eleven miles, the breadth of the belt varies from four to four and one-half miles.

It is a region of great producing mines; from a comparatively narrow section of the belt, less than three miles long, covered by the Ontario, Daly, Daly–West and Daly–Judge properties, an aggregate output, in silver and lead ores, of $60,000,000 has been made. No less is it a region teeming with interest to the geologist and the student of vein-phenomena. Here are to be found great fissure lodes, carrying silver-lead ore in shoots, associated with extensive flat sheet-like deposits of similar ore, formed by the replacement of a special stratum of limestone. Then there are novel exhibits of varied structural conditions which are involved in the localization and deposition of the ore. And last, we have what appears to be a new and singular type of fissure vein, in which the ore formed within the walls has not solely been brought up from the depths through the fissure itself, but has, in great part, been introduced into the lode at intervals in its rise toward the surface, by the agency of tributary fissures or 'verticals' coming up through the foot-country.

Four distinct sedimentary formations occur along the course of the belt, between the surface and the greatest depth explored, namely, the 2,000-ft. level of the Ontario mine. They are, first, the Upper Carboniferous, or 'black' limestone, covering the surface from the Daly shaft west and southwest across the properties of the Daly–West and Daly–Judge, to the crest of the Cottonwood divide; second, the Lower Carboniferous quartzite directly underlying it, usually designated as the Ontario–quartzite. A third stratified formation, developed in the lower levels of the Ontario and Daly mines, is known as the 'blue' limestone, or lower limestone. Along the northwestern flanks, a great thickness of Mesozoic shale and sandstone rests unconformably on the eroded surface of the black limestone. As this more recent formation is in no place cut by the Ontario lode, in the section described, it may properly be disregarded in the discussion of the mineral deposits.

The black limestone, often called the 'upper' limestone, attains a maximum thickness of 2,000 to 2,500 ft., made up of alternating strata of limestone and shale, with occasional thin beds of quartzite. These variations in the strata of the upper limestone are the result of frequent and repeated changes in the conditions of sedimentation in the sea in which the beds were laid down; a deepening or shoaling of the water—any change in the ocean currents and in the sediment transported—or some modification of the life-conditions prevailing, have influenced the nature and composition of the sediments, and the rocks eventually formed by their consolidation. Local variations also occur in the beds themselves, some strata changing in character even within a few hundred feet; other beds are substantially uniform and continuous as far as they have been explored in the workings of the mines. It will be shown in the discussion of the mineral formations in this limestone, that the structure and composition of the rock have determined the deposition of the ore in certain beds.

The Ontario-quartzite is 2,200 ft. thick; massive beds of hard white crystalline rock form the upper 1,500 ft., while the basal strata are impure sediments, soft silicious and clay-shales which pass into the lime-shale at the top of the lower limestone, without any well-defined separation.

This lower, or 'blue' limestone, changes in character with depth, becoming more nearly a pure limestone, the shale layers giving place to thin-bedded lime, very close and tight in structure. Its thickness has not been determined, but is known by exploration to exceed 1,500 feet.

Dikes of porphyry and other volcanic rocks intrude in places among the stratified formations. In the region about Bonanza Flat and the Big Cottonwood divide, large masses of granite and diorite occur. The volcanic activities giving rise to these varied intrusions, although they occurred at a relatively late period, long preceded the formation of the vein-fissures and the deposition of the ore; even the more recent of these dikes are cut and faulted by the mineral-bearing fissures.

The effect of these igneous emanations has been to alter the upper limestone to marble. Over broad areas in the Daly–Judge mine, the limestone beds for hundreds of feet thick, are bleached and metamorphosed into a fine-grained, crystalline marble, usually light gray in color. So perfect occasionally is this regional metamorphism, that the iron and the organic matter which gave to the original rock its dark color, are in some beds completely removed, with the production of pure white marble. In like manner the quartzites in some places in the western part of the mine are bleached, and resemble marble so closely, that it is difficult to distinguish these altered rocks, which are nearly pure silica, save by their hardness, or by testing with acid.

The porphyry and other igneous rocks are not in themselves ore-bearing. The mission of the great volcanic outbursts, which time after time have taken place in the mineral region, has been to fracture and open the strata for the reception of the ore. Near the close of the eruptive period, other igneous disturbances, deep-seated in the earth's crust, produced the fissures, and still later, inaugurated the ore-forming period, energizing the intense thermal and chemical activities that created the mineral deposits.

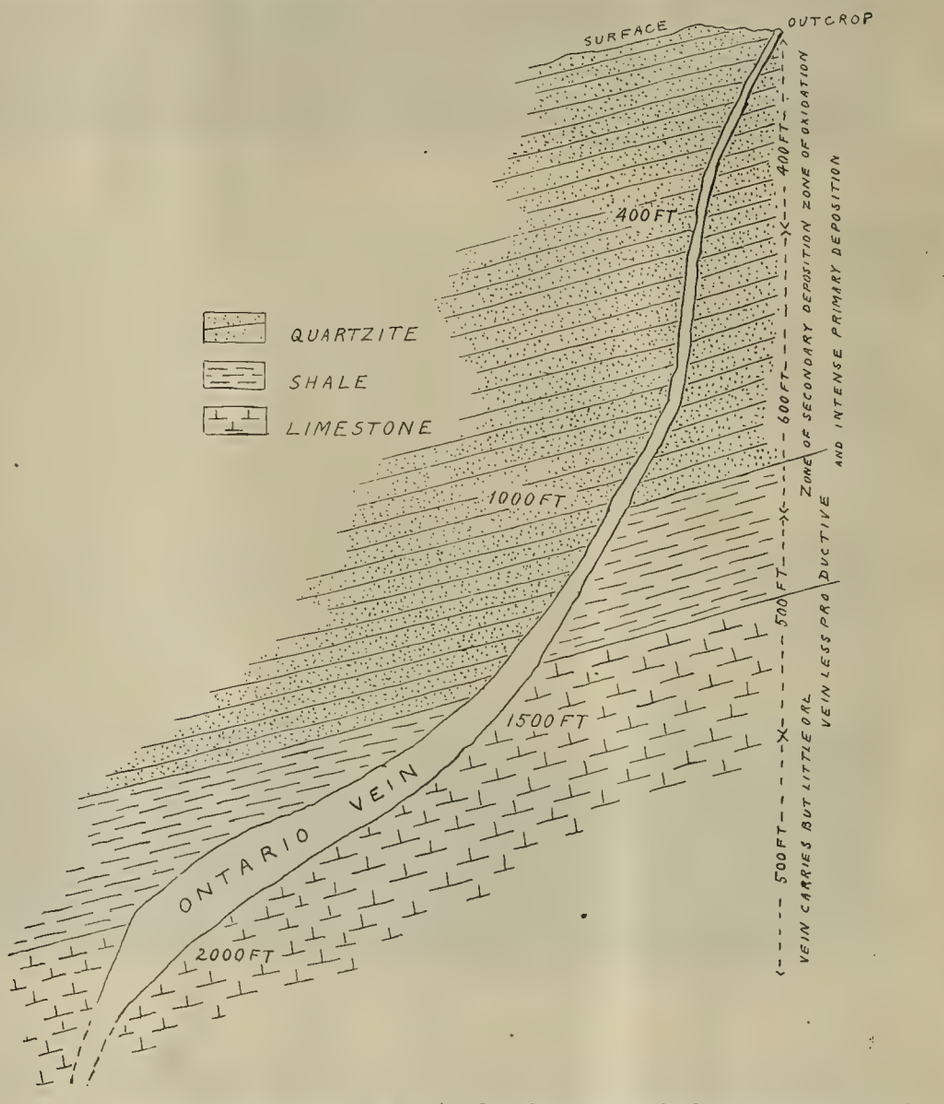
Ore-deposits in the sedimentary rocks, irrespective of the nature of the minerals constituting the ores, conform to the general law of selective deposition, namely, that, "*Some geological formations appear to be everywhere barren of ore; others occasionally carry small deposits, workable where the conditions are exceptionally favorable; but in each mining region, certain strata are ore-bearing in a degree exceeding all other formations combined.*"*

The Ontario-quartzite is the great ore-bearing formation of the Ontario and Daly mines, it is the wall-rock of the veins, from the surface to the 1,500-ft. or drain-tunnel level. The bedding of the sedimentary rocks is gently inclined, while the veins dip at a steep angle, and in their descent into the earth, cut the beds from the surface downward; when followed in depth, the vein passes successively through each geological formation, and the wall-rock varies with each change of the strata. These changes have influenced the deposition of the ore. In the Ontario and also in the Daly, where hard quartzite forms the walls, from the outcrop down to about the 1,000-ft. level, the ore-shoots are sheet-like in form, regular, continuous, and of great length; the ore is high-grade and is concentrated within comparatively narrow limits.

The shale beds, 500 to 600 ft. thick (lying between the hard quartzite and the lower limestone), owing to the soft and clayey nature of the rock, are generally unfavorable to ore. It is observed in these mines, that when the veins pass out of the quartzite into the shale, the ore deposits are small and continuous only for short distances. This fact is made even more plain by the relative production of the veins where traversing the several formations; more than 90 per cent of the ore was extracted from stopes where either one or both the walls were made by the Ontario quartzite.

The Ontario fissure, which maintains in the quartzite a nearly vertical attitude, flattens, in traversing the underlying shale, to a dip in some instances as low as 35° from the horizontal. Likewise the size of the vein also is influenced by the enclosing rock; where the walls are formed by quartzite, the ore-shoot averaged three to eight feet thick, seldom exceeding a width of 20 ft. of pay-ore; but on entering the shale the fissure increased greatly in size, attaining in places a breadth of 250 ft. or more. (See sketch). Occasionally such broad expansions of the lode were traversed in an irregular manner by three or more widely separated ore-streaks or subordinate veins, instead of the single sheet of mineral usually occurring in the upper levels. As, under these circumstances, the whole breadth of the vein had to be explored and each lode deposit mined and timbered by itself, the working charges were greatly increased.

In the Ontario mine, the lower limestone, where it forms the fissure-walls from the 1,500-ft. level to the 2,000-ft. level, is much more favorable to ore than the overlying clay-shale.



Near the contact of the Ontario quartzite with the 'upper' or black limestone, there occurs a stratum of soft gray limestone (25 to 35 ft. thick), resting upon a thin quartzite, separated from the Ontario quartzite below, by 100 ft. of impure and cherty limestone. Extensive and valuable deposits of silver-bearing galena are mined in this gray lime overlying the upper quartzite. Examined more particularly, this special ore-bearing formation is seen to be made up of heavy beds of fine-grained crystalline limestone, remarkably uniform in character, separated by shale-partings of varying thickness. In places, these shale layers thin out, so as to form a massive stratum 20 ft. thick; more commonly, four to eight feet of shale intervenes between the lime beds. Where oxidized by the action of surface waters, the gray limestone is brownish-black in color, owing to oxides of manganese and iron.

It is a singularly fragile and brittle rock, splitting readily in a direction at right angles to the beds. This peculiar fracturing of the gray lime is observed where pillars are left in the stopes; in a short time the weight of the roof crushes the rock into innumerable broad thin flakes, perpendicular to the bedding planes. It will be seen that the fragile character of this formation, causing the beds to be crushed and

* 'The Lead and Zinc Deposits of the Mississippi Valley' by W. P. Jenney, *Transactions* American Institute of Mining Engineers, Vol. XXII, pp. 187-188.

shattered by crustal movements, has influenced the deposition of the ore. Further, there are many evidences in the way that the mineral-forming waters have eaten out this limestone in huge pot-holes along the course of the fissures, and have replaced the rock itself by ore, that it was highly soluble and readily attacked by the heated waters or vapors.

In mineral formations of this character, not only in this, but in other mining regions of the West, the general law of special occurrence is found to hold good, namely, that "*Certain beds appear to have been peculiarly favorable to the deposition of ore. The beds immediately above or below the ore-impregnated strata are ordinarily barren. This occurrence of special ore-bearing beds, alternating with barren strata, is usually found to prevail through a given area of disturbance and mineralization.*"† Such beds, the prominent ore-producers of a district, are particularly sought in prospecting. They are known as 'ore-horizons,' and often occur one below another, forming a vertical series of orebodies. These ore-horizons may be of any thickness, limited only by the occurrence of beds of uniform character and composition, favorable to the precipitation of particular minerals. The intervals of separation between the several horizons are dependent on the thickness of the intervening non-mineralized strata. Recent developments in these mines afford evidence that likewise, in places where the conditions are favorable, ore-deposits occur in lime beds, situated at different levels, or distinct horizons, above the contact; a subject that I shall treat more fully later.

While it may be accepted, that the ore-bearing quality of the special bedded formation occurring at the quartzite contact, is proved beyond all question, it must be admitted, that as regards the influence of the upper limestone, where it forms the walls of the veins, the evidence is conflicting. An understanding of the conditions which influence, or in any way modify, the productiveness of the veins, is of the first importance in the development of these mines; particularly, information of the special conditions controlling the localization, or determining the position in the fissures, of the orebodies.

In these formations, the effect of the wall-rock upon the ore-bearing character of the vein is mainly due to the nature of the attrition material which fills the fissures and constitutes the gangue (or matrix of the ore). This attrition breccia is largely formed from the fragments detached from the walls, crushed and ground by the movement of one wall upon the other. For this reason, the structure and the chemical composition of the strata enclosing the vein determine largely the favorable or non-favorable character of the gangue. The special influence of the geological formation on the deposition of the minerals is far less pronounced in certain other mining regions, where the quartz filling the fissures is formed by silica-bearing waters, and only in small part is composed of rock derived from the walls. Weed observes that fissures filled by crustification are often seen to be unaffected in the nature of the ore and the associated minerals, by changes in the wall-rock.‡

It can be understood readily that the diverse nature of the strata constituting the great thickness of the black limestone (some beds being nearly pure limestone, other beds containing a large proportion of silica or of clay), necessarily have influenced the deposition of the ore, where these rock strata actually enclose the vein. Further, long prior to the formation of the mineral-bearing fissures, the metamorphism of this lime formation, caused by volcanic intrusions, has in many places, particularly in the Daly–Judge mine, greatly changed the structure and chemical composition of the rock. In many instances large blocks have been displaced by the faulting movements (that made the vein fissures), so that in places the beds which form the foot and hanging walls on the same level are not identical. All of these factors must be taken into consideration, where the veins traverse the black limestone, in order to determine the influence of the walls upon the formation of the mineral deposits.

The ore-shoot in the Back vein of the Daly–Judge mine has been stoped from the 1,400-ft. level to above the 600-ft. level, a distance of more than 900 ft., measured on the dip of the vein. All the way, from the Ontario quartzite at the 1,350-ft. level upward, the walls are the upper limestone; throughout the extent of the shoot the ore has been of good grade, continuous, and uniform in mineral character.

The upper limestone has been removed by erosion over the outcrop of the Ontario lode, so that no evidence bearing upon this question can be obtained from that mine. On the other hand, the behavior of the Daly vein in the black limestone, in so far as it has been explored, seems to show that this formation is generally unfavorable to ore. The productiveness of this vein in the Ontario quartzite has been shown. It was also very productive in the upper levels of the Daly, with the Ontario quartzite forming the foot-wall, and the upper limestone the hanging. But in the western part of the Daly mine, between the surface and the 600-ft. level, the vein entered the upper limestone, and no longer carried pay-ore.

The vein behaved in much the same way in the Daly–West mine. In the Ontario quartzite, at the 1,500 ft. level, the fissure is uniform in width, measuring five to eight feet between walls, and the ore is of good grade. When followed west on this level, the upper limestone appears on the hanging, the foot remaining quartzite, and the change in wall-rock is seen to increase the width of the fissure. The grade of the ore is reduced, owing to the masses of waste which cannot be separated in mining, although the tonnage is increased. Further, the large ore-shoot on the 1,300 and the 1,400-ft. levels, in the western part of the mine, has been highly productive, where the foot-wall is quartzite, and the hanging wall black limestone. When this shoot was stoped above the 1,200-ft. level, the ore continued for 60 to 70 ft. and terminated where the fissure entered the upper limestone.

This evidence would seem to imply that from some cause the Daly vein is not productive in the upper limestone, at least, so far as it has been prospected in the lowest (or basal) beds of that formation. It is true, however, that only limited exploration has been made in the upper levels of any of these mines where the walls are limestone, and that experience in mining the Daly vein has shown that, not infrequently, long barren intervals separate orebodies, and that shoots with a flat pitch often are bounded by unproductive ground above and below. Only exploration will settle this question definitely.

Reviewing the influence of the wall-rock upon the nature of the gangue, upon the richness of the mineral deposits, and upon the localization of ore-shoots, it is observed that the wall-rocks most favorable to ore are hard and crystalline, nearly free from clayey material, yielding (when crushed, brecciated and ground between the fissure-walls) an open permeable matrix for the reception of minerals; that soft shaly strata, formed from impure sediments, are generally unfavorable, owing to the plastic or sandy clay produced by the decomposition of the rock, filling the interspaces in the matrix and rendering that portion of the vein, where such beds constitute the walls, impervious to the circulation of mineral-bearing waters.

The effect of clay, in thus acting mechanically so as to prevent deposition of minerals, is seen in places in the Ontario mine, where the vein, carrying ore, cuts through porphyry dikes; the clay derived from the decomposition of the igneous rocks usually causes the ore to pinch to a thin seam, or to occur in small stringers or bunches, scattered through the fissure where it traverses the porphyry; the orebody again becomes regular and continuous, after passing beyond the influence of the local change in the walls.

Limestone, either pure lime-carbonate or nearly pure dolomite, forms an exceptionally favorable vein-wall; the ore is deposited not only within the fissure, but frequently extends beyond it for a distance, impregnating the country. In such occurrences, chemical factors become dominant, the solubility of the rock, the effect of the carbonic acid liberated by the reaction, as well as any carbonaceous matter contained in the rock and set free by its dissolution, and the action of the dissolved calcareous substances in destroying the chemical equilibrium of the mineral-saturated waters, causing the precipitation of the metals.¶

CLEANING AMALGAMATING PLATES.—The preliminary setting of plates is well known, and it suffices to say that the copper must be thoroughly well cleaned before the mercury is used; the plate being carefully kept clean is allowed to accumulate a thin layer of hard amalgam, and when this is accomplished the routine work of dressing, scouring, brushing, and the many attendant burnishing methods so dear to amalgamators is continued day by day. By thoroughly scouring or loosening the amalgam by means of rubbing the whole surface of the plate with a little clean sand or gritty matter, the amalgam becomes pasty and is easily removed without unduly affecting the copper itself, as with a chisel or other sharp instrument. Where this work is well done the maximum amount can be taken from the plate each shift, and will prevent undue accumulation beside largely obviating the necessity of frequently steaming the plate.—Fraser Alexander, *Chem. Met. Soc. of South Africa.*

THE miner calls everything which results in the non-explosion of his charge a miss-fire, and the term is therefore one which is enigmatical. Miss-fires in the ordinary sense occur through the miner omitting one or other of the rudiments of his business, through the detonator becoming detached from the charge, and through many other similar causes. A miss-fire from the chemical point of view is, however, a very different matter, and is generally caused by an insufficiency of either explosive or detonating mixture, or by a certain physical condition of the explosive itself. The results of a miss-fire such as this are most serious, for not only might a part of the whole of the charge be left in the bore-hole, endangering the miners' lives, but through the incomplete explosion poisonous gases arise.—E. H. Weiskopf, *Chem. Met. Soc. of South Africa.*

The Cyanide Process at Guanajuato.

Written for the MINING AND SCIENTIFIC PRESS by FRANCIS J. HOBSON.

In 1899 a number of cyanide tests were made on Cubo ore by chemists in the employ of the Mexican Gold & Silver Recovery Company, the owners of the MacArthur Forrest patents in the Republic of Mexico. The results of these tests were far from satisfactory. The consumption of cyanide was low but the extraction also was low, averaging from 40 to 85 per cent of the silver and gold in the ore. Most of the tests were made on samples weighing 100 grams, crushed to pass screens from 30 to 80–mesh. In addition to solutions of potassium cyanide there were added to the charges under treatment, different percentages of potassium ferri–cyanide, permanganate and even ferro–cyanide, and to some of them were added various amounts of sodium dioxide. The time of treatment, in nearly every case, was 16 hours. In consequence of these experiments, the process was condemned at Guanajuato. Shortly afterward, on the recommendation of E. A. Wiltsee of the Venture Corporation, the Holmes brothers experimented for several months on Sirena and Cubo ores; the results of these further experiments led them to conclude that the ores of this district could be successfully cyanided by sliming everything. One point in their report was especially prominent, that even with 40 days' leaching the sand resulting from crushing to 40–mesh gave no extraction by treating with cyanide solution. This was on Sirena ore. About three and a half years ago the Butters company took up the question of cyaniding the Sirena ore, and E. M. Hamilton, of that company, ran a series of tests on a large scale at the hacienda Pastita, treating sand and slime after ore concentration on Wilfley tables; leaching the sand and agitating the slime. The ore was crushed in a stamp–battery to pass a 30–mesh screen. Fifteen days' leaching of the sand with 0.3 per cent cyanide solution, and slime–agitation with 0.05 per cent solution, gave excellent extraction. The metals in both cases were electrically precipitated on sheet–lead cathodes. The total extractions recovered by Mr. Hamilton from two series of tests showed 92.5 and 94.5 per cent of the total value of the ore, the yield being in concentrate and bullion. On the basis of Mr. Hamilton's experiments the Guanajuato Consolidated Mining Company installed the present excellent plant, with a capacity of approximately 200 tons per day.

Two years ago I was engaged by the American Finance & Security Company to make a metallurgical examination of the Valenciana ores. The material treated first came from the Guadalupe dump, a dump which contains about 1,000,000 tons of ore. The tests were made on part of the samples taken from shafts which were sunk through the dump in order to ascertain its value. The tests were made with the 5–stamp mill and cyanide plant at the hacienda Central. First we milled several lots of ore with battery screens ranging from 20 to 30–mesh, concentrating on a Wilfley table, separating sand and slime with spitzkasten and spitzlutten. The spitzlutten were placed immediately under the spitzkasten. An excellent separation was obtained, making approximately 70 per cent of sand and 30 per cent of slime. About 500 lb. of sand and 150 lb. of the slime were shipped to Mexico City and there subjected to experiment in the laboratory of the Mexican Gold & Silver Recovery Company. Lots (each 5 kilo.) of ore were leached continually, with solutions varying from 0.1 to 0.7 per cent KCy for 15 days. In each case the silver and gold were precipitated on zinc shaving. A tailing sample was taken daily for 15 days, there being 21 sand–charges under treatment. At the end of 12 days the extraction ceased. Cyanide consumption ranged from 0 75 to 1.5 lb. per ton of ore treated. With 0.3 and 0.4 per cent solutions the extraction was equal to that secured with stronger solutions, and the consumption of cyanide was only one pound per ton of ore treated. The experiments on slime were run on a very small scale at first, agitating in bottles with various strengths of solution; a chemical extraction of about 88 per cent of the silver was obtained with a 0.05 per cent solution, with a chemical consumption of about one pound of potassium cyanide per ton treated. Then tests were made on a larger scale, using compressed air for agitation and a 0.05 per cent solution. Both decantation and the Moore filter–press methods were tried for separating solution from residue. Both were efficient but no apparent advantage could be gained by use of the Moore filter, the only saving being in cyanide, and this was so small that there was no profit in using the method, leaving out the question of royalties. The metals were precipitated on zinc shaving. Exhaustive tests with zinc–dust precipitation were not at all satisfactory. To my personal knowledge this was the second case where zinc–dust precipitation would not work. With these results for a guide, I milled 70 metric tons from the Guadalupe dump at the hacienda Central, concentrating, separating sand from slime, and cyaniding them separately. I used a 0.4 per cent solution for leaching sand and 0.05 per cent for agitating slime. Approximately 35 per cent of the ore value was separated in the form of concen-

trate. We obtained an extraction on sand of 86 per cent of the silver and 97 per cent of the gold; from slime, we extracted 90 per cent of the silver and 97 per cent of the gold. The time of sand-leaching was 12 days, and the total time of slime-treatment was three days, one day of which was active agitation. On sand, the consumption of cyanide was 1.1 lb., and on slime, including mechanical loss, it was a trifle less than 2.5 lb. per ton of dry slime. The metals were precipitated on zinc shaving. A clean-up was made, the coarse zinc was reduced with sulphuric acid, and the product melted into bullion. The two bars of bullion thus obtained contained in gold 2.4 cents per ton of ore more than the assays indicated. The silver, on the other hand, was 8 grams, per ton of ore, short. Taking into consideration the fact that the precipitation was in a new wood zinc-box and that, after the clean-up was made, it was shipped to the State of Michoacan to reduce coarse zinc with acid, and then melted four times in order to get bullion 900 fine, it could not be considered otherwise than an absolute check on the work. A lot weighing 100 kilo. of concentrate was shipped to Mexico City, one-half being leached without re-grinding; the other half was re-ground to pass 100-mesh, and was then treated with cyanide by the agitation and decantation method. In both cases the metals were precipitated on zinc shaving. The time of treatment in the first case was 90 days with 0.3 per cent solution; in the second, eight days, with same solution. Total extraction was more than 90 per cent. There was no trouble in precipitation. In both cases the clean-up checked the assays of heading and tailing.

In consequence of these experiments, the 80-stamp mill at the Bustos and the cyanide plant at the hacienda Flores are being installed. I entertain no doubt of obtaining in practice results equal to those achieved in the laboratory in Mexico City and in the experimental mill at the hacienda Central. The laboratory results and the extractions obtained in actual milling varied less than one per cent. I believe Mr. Hamilton's tests are being confirmed in practice at Pastita.

Two years ago the owners of the Cubo mine installed a cyanide plant at their hacienda. I am not familiar with the results obtained, but they appear to be good from the fact that the plant is still running. About one year ago the Peregrina Mining & Milling Company employed me to make a metallurgical examination. Results were highly satisfactory, 94 per cent of the precious metals being extracted; and the company is operating a 20-stamp mill and cyanide plant; they are now erecting an additional 100 stamps with cyanide annex. It is stated that the Peregrina mill has obtained as much as 96 per cent extraction of silver. George W. Bryant has a cyanide plant in operation at the hacienda Central, and another nearly ready at Nayal; the extraction is satisfactory and this plant also is being enlarged. Frank G. Peck, of the Portland Mining Company at Cripple Creek, has purchased, and will soon have erected, a 40-stamp mill and cyanide annex at the hacienda San Matias. Mr. Ibarguengoitia has changed his patio process to cyanidation, and is treating daily about 30 tons of custom ore. The Adams Company at La Luz expects to erect 100 stamps with cyanide plant. The Guanajuato district is now cyaniding 350 tons of ore daily; with the plants now purchased and under erection, this amount will be increased shortly to 1,400 tons per day.

GOLD-COPPER ALLOYS tarnish on exposure to air owing to oxidation of copper, and blacken on heating in air from the same cause. This oxidized coating may be removed and the color of fine gold (not that of the original alloy) produced by plunging the metal into dilute acids or alkaline solutions, the operation being technically known as 'blanching.' The color of the alloys may be improved without previous oxidation by dissolving out some copper by acids, a film of pure gold being left on the outside, which can be burnished. French jewelers use a hot solution of two parts of nitrate of potash, one part of alum, and one of common salt for this purpose. Nitric or sulphuric acid dissolves out the copper from gold-copper alloys under conditions similar to those under which it removes silver with gold-silver alloys. If the copper falls below 6.5%, the alloy is not attacked by these acids. *Aqua regia* dissolves all the alloys completely.—T. K. ROSE.

CORROSION OF THE STEEL FRAMES OF BUILDINGS.—An investigation of the best means of preventing corrosion of the steel used in the framework of modern buildings. There can be no question, the author says, that moisture and carbon dioxide are the active agents in causing the rusting of the steel. It has been held that the formation of a coat of rust upon the surface was the beginning of progressive action whereby the iron oxide acted as a carrier of oxygen to the steel beneath. It is extremely probable that in a comparatively dry place this action is exceedingly slow. Experiments made showed that neat Portland cement even in thin layers applied to clean surfaces was effective in preventing rusting. Cinder concrete from the presence of iron oxide is not so effective. Paints do not compare favorably with cement as a protection.—C. L. Norton, *Technology Quarterly.*

The World's Copper Trade.

Written by HORACE J. STEVENS.*

The world now consumes considerably more copper in a single week than was required for an entire year one century ago. In fact, the present-day consumption of those minor metals, aluminum and nickel, is about the same each as was the consumption of copper 100 years ago. Despite the popular impression that the bulk of the copper production is required for electrical uses, the demands of the engineering trades still require more than half of the entire output of the metal. The minor uses of copper are very numerous, and are steadily increasing. Sulphate of copper, used as a spray on grape vines and currant bushes, as an insecticide, takes tens of thousands of tons of metal yearly. There is a single concern in the Naugatuck valley of Connecticut that requires 10 tons monthly for watch dials. The orders of the pin-makers take vast quantities yearly, and such apparently insignificant things as brass balls for men's shoes require hundreds of tons annually. Modern buildings, both for residential and business purposes, are heavy consumers of copper, mainly in the form of brass for plumbing, gas and electric lighting fixtures, door butts and locks. Copper roofing requires large amounts of metal, and copper cornices consume materially larger quantities. While the bulk of the copper produced is required for the necessities of the engineering and electrical industries, no small amount is consumed for the little things, to which few but the close observers of the trade give attention.

The year 1905 has given much the largest production of copper ever known. For that matter, 1893 is the only year in the past quarter century in which the world's production of the metal has not increased, and a falling off in that year, as compared with 1892, was less than three per cent. The increased output of 1905, however, is incomparably the greatest ever made in the history of the trade. It amounted to 723,550 tons, as against 648,924 tons in 1904.

The production of copper by the United States and by the entire world has been as follows for the past ten years:

Year.	United States. Tons.	The World. Tons.
1896	205,384	373,363
1897	220,571	398 955
1898	235,050	429,156
1899	253,870	469,310
1900	269,111	485,854
1901	268,523	511,019
1902	294,297	542,167
1903	311,582	585,081
1904	362,739	648,924
1905	421,000	723,550

The estimated output of the world for 1905, which will be found not far from correct when compared with the final figures, indicates an increase of more than 116% in the decade since 1895—the largest increase ever made in any ten-year period.

For the first five years of the twentieth century the production of the world has been as follows, with percentages of increase from year to year:

Year.	Output. Tons.	Increase Per Cent.
1900	485,854	
1901	511,019	5.19
1902	542,167	6.99
1903	585,461	7.97
1904	648,924	10.83
1905	723,550	11.50

During the nineteenth century the average rate of increase, compounded annually, was a trifle more than 4 per cent. The average ratio of increase in production (which in the long run means consumption also) of the leading commercial metals, including copper, iron, lead, tin and zinc, and also coal, the necessary concomitant of the metals, was six to seven per cent annually, compounded, during the last half of the nineteenth century, with 6½ per cent as an approximate constant. That the production and consumption of copper are upon a new basis in the twentieth century is shown by the figures of the last table. The net increase of 1905 production over the output of 1900 is 48.88 per cent. It has been an axiom of the metal trade for some years that the normal ratio of increase in copper production is eight per cent annually, and the figures of production for the first five years of the present century bear out this theory in a most striking manner. Eight per cent, compounded annually for five years, would give an increase of 46.93¾ per cent, and, as a matter of fact, the 1905 production is 48.88 per cent greater than that of 1900. Furthermore, the production for the decade ending 1905 shows an increase of 116.30 per cent. As an increase of 8 per cent, compounded annually for ten years, amounts to 115.89 per cent, the increased production in the past ten years has been almost exactly 8 per cent per annum, compounded.

During the decade ending 1905, the production of the United States has increased 148 per cent, and the production of all other regions has increased 84 per cent. The largest percentage of increase outside of the United States is shown in other North American countries. For the decade ending 1905 the Canadian mines have increased production by 425 per cent and the mines of Mexico have gained 459 per cent. The mines of North America made 187,337 tons of copper in 1895 and 510,650 tons in 1905, an increase of 178 per cent. The rest of the world made 147,228 tons of copper in 1895 and 212,900 tons in 1905, an increase of 45 per cent.

In the following table is given an estimate of the output of the 42 copper mines of the world that have made 10,000,000 lb. or more during the year, with figures of 1904 for comparison:

Mines.	Pounds Avoirdupois— 1905.	1904.
Anaconda	105,000,000	90,000,000
Boston & Montana	90,000,000	94,000,000
Calumet & Hecla	82,500,000	80,341,019
Rio Tinto	80,000,000	80,214,400
Copper Queen	75,000,000	58,605,000
Greene Consolidated	60,000,000	55,014,339
Mansfeld	42,500,000	41,629,349
United Verde	36,000,000	29,500,000
United Copper Company	35,000,000	35,311,353
Arizona Copper Company	33,000,000	32,197,760
Calumet & Arizona	32,500,000	31,634,895
Old Dominion and United Globe	32,000,000	15,368,147
Original	30,000,000	20,500,000
Furukawa	23,000,000	21,599,300
North Butte	23,000,000	.....

Tharsis	11,500,000	12 590,228
Trimountain	11,250,000	10,211,230
Mountain Copper Company	10,000,000	19.116,160
Lota y Coronel	10,000,000	10,000,000
Montezuma	10,000,000	9,632,000
Guggenheim Exploration Company	10,000,000	6,000,000

The greatest gain has been made by the Copper Queen mine, in Arizona. The Anaconda has also made a substantial gain, and the United Verde shows a fair increase. The Trent and Washoe mines are amalgamated properties in Montana that were not on the producing list in 1904. The North Butte is an important new mine in the Butte district, made by the consolidation of a number of claims, with the old Speculator mine as a nucleus. The Guggenheim Exploration Company's Mexican properties are likely to become increasingly important producers of copper.

A glance at the various copper-producing countries of the globe shows that the most important developments have taken place in the the United States. The Lake Superior district has several new producers, all small at present, but destined to take high rank in the next few years, for the making of a Lake Superior mine that can turn out 10,000,000 lb. of fine copper yearly is a task requiring at least five years. In Montana, the Amalgamated Copper Company's mines at Butte show a large gain in production. The expensive litigation between Heinze and the Amalgamated interests has been stopped so far as concerns starting new suits or pushing old ones, and some sort of an agreement has been reached—if not a working alliance, at least a *modus vivendi*. The same strong interests that developed the Calumet & Arizona mine control the North Butte, a property that closes the year with a monthly production of about 3,000,000 lb. As the direct result of the opening of this wonderfully rich mine, a large addition has been made to the known productive and workable area in the northern part of the district. The Pittsburg & Montana, in eastern Butte, has added immensely to the prospective value of that portion of the district also.

Arizona has made a phenomenal increase during the year. The Copper Queen is now producing at about the same rate as the Rio Tinto and Calumet & Hecla, and is developing new mines that promise a further advance in the near future. The Lake Superior & Pittsburg and Pittsburg & Duluth have begun production in a small way with one leased furnace at the Calumet & Arizona smelter, and promise shortly to become large producers. The Graham county mines do not show any important change. The Globe district has more than doubled its production, and the Old Dominion has become one of the world's big mines. The Imperial mine, in Pima county, has made a considerable production, and should make in excess of 10,000.000 lb. in 1906. Exploratory and development work of a promising nature is under way in various parts of Arizona.

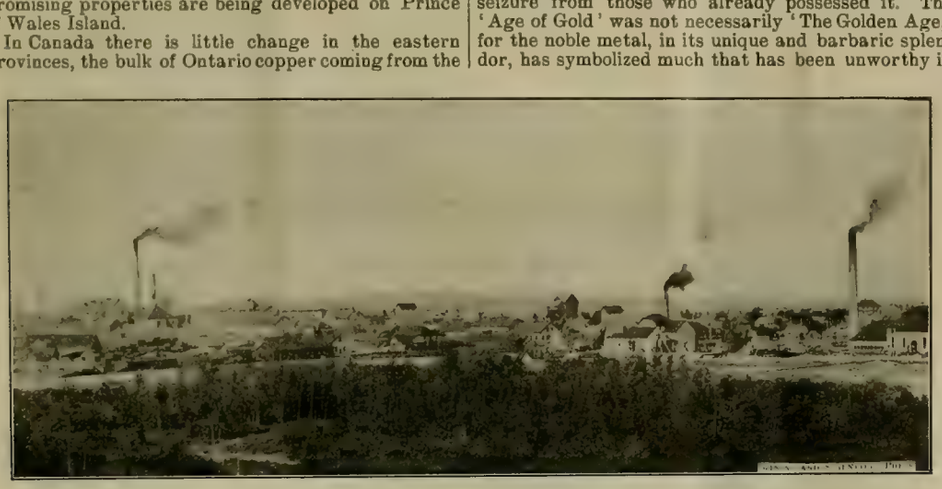
Utah has not largely increased its output, but shows a healthy gain. Developments at Bingham have been highly important and strong interests have secured two properties containing many million tons of low-grade ore. While the margin of profit will be small, owing to the very low grade of the ore, the tonnage is so enormous that Bingham must, of necessity, become an increasingly important factor in the world's copper supply. The Newhouse mines, in Beaver county, Utah, have begun production during the year, and will be followed soon by other properties in the same district.

California shows a decreased output for the year, due to construction of new and improved smelting and acid works by the Mountain Copper Company, but will gain considerably in production during the

*Copyright, 1905, by Horace J. Stevens.

next few years. The United States Mining Company has secured and is now operating the Mammoth mine, and the General Electric Company has bought the Bully Hill mine and will enlarge production. In Wyoming, the Penn-Wyoming Company has produced about 6,000,000 lb. blister copper, and, with the completion of the new railroad into Carbon county, Wyoming should gain several other producers. Alaskan mines show an increasing production, and some promising properties are being developed on Prince of Wales Island.

In Canada there is little change in the eastern provinces, the bulk of Ontario copper coming from the nickel-copper ores worked by the Canadian Copper Company in the Sudbury district. In British Columbia the mines of the Boundary have made progress in the way of improving the finances of several of the weaker companies. The Boundary ores, while occurring in almost inexhaustible quantity, are very low grade, and the companies that work them successfully must have large capital as well as good management. The Granby remains easily foremost, and has had a very good year. The smelting plant is being increased, and the Granby is evidently destined to become a very large producer. On the British Columbian coast the Tyee, a promising property, seems to have fallen upon evil days, and the local management has been changed, with what seems undeserved contumely. The Britannia mine is being developed by strong and experienced copper men, and promises to be the leading producer of the coast. In the Yukon district a little copper ore of high grade is produced from the White Horse district.



Calumet & Hecla and Tamarack Mines, Michigan.

Mexico shows an increased production for 1905, though the gain is not so great as in the preceding year. The Greene Consolidated, at Cananea, remains the great producer, furnishing nearly half of the total output of the Republic. The management of the Greene is now considering plans, based on the methods used in Lake Superior iron ore mining, for greatly increasing ore extraction, while reducing costs per ton mined. The Boleo still finds difficulty in securing sufficient labor. The root of the trouble lies in the low wages paid, which are the same as ten years ago, while the Greene and other American-managed mines in Sonora and Chihuahua have more than doubled the former rate of wages paid the *peons*. Uprisings of the Yaqui Indians have greatly hampered developments at several promising new copper mines in the State of Sonora. The Moctezuma remains the third copper producer of the Republic, but the interests of the Guggenheim Exploration Company, which is closely related to the American Smelting & Refining Company, are becoming of greatly increased importance. The Teziutlan and several other independent mines are increasing their yield. The impetus already given Mexican copper mining is such that a steadily increased annual production may be expected.

Gold and Silver Production.

The Director of the Mint estimates the production of gold and silver in the United States during the calendar year 1905 to have been $86,377,000 of gold and 58,938,355 fine ounces of silver:

States or Territories.	Gold. Value.	Silver Fine Oz.	Silver Value at 61c.
Alaska	$14,650,000	236,578	$ 144,312
Arizona	3 500,000	3 400,000	2,074,000
California	17,502,000	879,411	536,440
Colorado	25,333,300	12,704,919	7,750,000
Idaho	1,550,250	9,000,000	5,490.000
Michigan		127,800	77,958
Montana	5,064,800	13,500 000	8,235,000
Nevada	4,700,000	6,000,000	3,660,000
New Mexico	413,400	250,000	152,500
Oregon	1,320,200	81,560	49,751
South Carolina	101,600	223	136
South Dakota	6,951,600	138,409	84,429
Texas	2,300	469,600	286,456
Utah	4,651,200	12,000,000	7,320,000
Washington	368,800	115 452	70,425
Wyoming	30,700	32,528	19,842
Total	$86,377,700	58,938,355	$35,952,396

The Klondike (Canada) produced $8,239,300 in gold, while Nome (Alaska) yielded $4,357,330.

Cyanide as a Factor in Gold Production.

In his presidential address before the chemical section of the British Association, G. T. Beilby said:

From the early beginnings of civilization gold has been highly prized and eagerly sought after. Human life has been freely sacrificed in its acquirement from natural sources, as well as in its forcible seizure from those who already possessed it. The 'Age of Gold' was not necessarily 'The Golden Age,' for the noble metal, in its unique and barbaric splendor, has symbolized much that has been unworthy in national and individual aims and ideals. With the advent of the industrial age gold was destined to take a new place in the world's history as the great medium of exchange, the great promoter of industry and commerce. While individual gain still remained the propelling power toward its discovery and acquisition, every fresh discovery led directly or indirectly to the freer interchange of the products of industry, and thus reacted favorably on the industrial and social conditions of the time. So long as the chief supplies of gold were obtained from alluvial deposits by the simple process of washing, the winning of gold almost necessarily continued to be pursued by individuals, or by small groups of workers, who were mainly attracted by the highly speculative nature of the occupation. These workers endured the greatest hardships and ran the most serious personal risks, drawn on from day to day by the hope that some special stroke of good fortune would be theirs. This condition prevailed also in fields in which the reef gold occurred near the surface, where it was easily accessible without costly mining appliances, and where the precious metal was loosely associated with a weathered matrix. These free-milling ores could be readily handled by crushing and amalgamation with mercury, so that here also no elaborate organization and no great expenditure of capital were necessary. A third stage was reached when the more easily worked deposits above the water-line had been worked out. Not only were more costly appliances and more elaborately organized efforts required to bring the ore to the surface, but the ore, when obtained, contained less of its gold in the easily recovered, and more in the refractory or combined form. The problem of recovery had now to be attacked by improved mechanical and chemical methods. The sulphides or tellurides with which the gold was associated or combined had to be reduced to a state of minute subdivision by more perfect stamping or grinding, and elaborate precautions were necessary to insure metallic contact between the particles of gold and the solvent mercury. In many cases the amalgamation process failed to extract more than a very moderate proportion of the gold, and the quartz sand or 'tailings,' which still contained the remainder, found its way into creeks and rivers, or remained in heaps on the ground around the batteries. In neighborhoods where fuel was available a preliminary roasting of the ore was resorted to, to oxidize or volatilize the baser metals and set free the gold; or the sulphides, tellurides, etc., were concentrated by washing, and the concentrates were taken to smelting or chlorinating works in some favorable situation where the most elaborate metallurgical methods could be economically applied. Many efforts were also made to apply the solvent action of chlorine directly to the unconcentrated, unroasted ores; but, unfortunately, chlorine is an excellent solvent for other substances besides gold, and in practice it was found that its solvent energy was mainly exercised on the base metals and metalloids, and on the materials of which the apparatus itself was constructed. This practically was the state of matters in 1889, when the use of a dilute solution of cyanide of potassium was first seriously proposed for the extraction of gold from its ores, and the proposal was far from favorably regarded from a chemical point of view, owing to the various difficulties which presented themselves. How each and all of these difficulties have been swept aside, how within little more than a decade this method of gold extraction has spread over the gold-producing countries of the world, now absorbing and now replacing the older processes, but ever carrying all before it—all this is already a twice-told tale which he only felt justified in alluding to as they were then meeting on the Rand, where the infant process made its *debut* nearly fourteen years ago. The Rand to-day is the richest of the world's goldfields, not only in its present capacity, but in its potentialities for the future; twenty years ago its wonderful possibilities were unsuspected, even by experts. In 1889 the world's consumption of cyanide of potassium did not exceed 50 tons per annum. At present the entire consumption of cyanide is not much short of 10,000 tons a year, of which the Transvaal goldfield consumes about one-third. Large cyanide works exist in Great Britain, Germany, France, and America, so that a sure and steady supply of the reagent has been amply provided. In 1894 the price of cyanide in the Transvaal was 2s. per lb.; today it is 8d. Chemistry has so often been called on to play the part of the humble and unrecognized handmaiden to the industrial arts that he might perhaps be pardoned if in this case he called public attention to Cinderella as she shines in her rightful position as the genius of industrial initiation and direction.

Smelter of the Shannon Copper Co., Metcalf, Arizona.

SPECIAL ISSUES of the MINING AND SCIENTIFIC PRESS will be issued fifty-two times per annum, one each week. Each number will contain something useful to mining men, engineers, metallurgists or geologists, no matter how restricted their interests may be.

The Boring of an Oil Well.—II.

ANOTHER LETTER WRITTEN BY A GREEN HAND TO HIS FRIEND AT HOME.

Written for the MINING AND SCIENTIFIC PRESS.

MY DEAR JOHN: You must be under the impression that I am running a correspondence school on well drilling. No, my dear boy, a bullrope is not to tie an animal with. We don't use anything of the bovine species about a drilling well. Some of the men may get a little bullheaded sometimes, but that is all. A bullrope is a rope 2⅜ in. in diameter, and about 100 ft. long.

It runs in a grooved wheel on the side of the bandwheel and from there to the 'tug' wheel on the bullwheels. The belt runs from the engine to the bandwheel and transmits the power to it, and the bullrope transmits the power to the bullwheels. The bullwheels are 7 ft. 6 in. in diameter. The tugwheel is on one end of a 16-ft. shaft and a brakewheel on the other. The brakewheel is what its name implies. It has a brake band around it, fastened to a brake lever and the driller lets the tools in with it, catches them if the bullrope breaks, and a dozen other things. The shaft is about 16 in. in diameter and the cable 'spools' on it.

If anything else worries you, just pass it up to me and I will try and elucidate. I have been here two weeks now and feel that I am pretty well up. Slade says that I know more than I will ten years from today. By the way, John, maybe I was not fortunate in not telling that my 'Governor' was one of the stockholders. If what the drillers say is true, the oil business has been damned by relatives and friends of stockholders. Any relative that has proved a failure in everything else is deemed fit to manage an oil company, or they take that method of getting rid of them.

The last week has been uneventful, so I have not got much to tell. I know why they are so particular about not letting any of the sandpumping get back in the hole (sandpumping is the name used for the earth drilled up and bailed out). If the water gets back into the hole it softens the wall and it caves or sloughs off and it is necessary to case the well. We let the water down to the bottom in the bailer, and then we have a chain on a rope tied inside the bailer, and when the valve lifts in the bottom the chain gets under it and the water runs out.

We are nearly 600 ft. and everything going smoothly; we did lose a bailer once—it caught on the wall and dropped, breaking the sandline. I was speechless, but Slade got a ropespear—a long iron bar with a lot of barbs on it—and screwed it on in place of the bit, and run it down and it caught in the sandline, and we pulled it out.

As we are only expecting to drill 1500 ft., I thought we would be finished in a couple of weeks, but Slade says two months yet. I can't see what's doing. I am a little anxious to 'strike oil.' We are ½ mile ahead of the other developments and every person seems to think it's a case of the fool and his money soon parted.

By the way, John, be sure and tell my Governor not to let the manager know that I am any relation to him.

Your interest in my letters is only exceeded by your nerve in demanding that I write you every Sunday. You seem to think that Sunday is a holiday here, just as it is in your sleepy old town.

I have worked for three Sundays now. If we didn't work our pipe would 'freeze up.' No, it is not so cold as all that, for 'freeze' is only a term to indicate that the sand had settled so solidly around the casing that it would not move up or down. The fine sand settles around the coupling of each joint, which makes a shoulder of nearly an inch on the pipe so we have to pull the pipe up every few hours to keep it free.

When I tell you that we have big triple blocks, about 700 ft. of 1-in. wire line that, woven through the blocks, gives us seven lines in the derrick, and sometimes it is impossible to move the pipe with this power, you may know that it freezes some.

When I wrote you last we were down 600 ft. Well, when Slade and I came on tower Sunday at midnight, we found on running the tools in that the hole was filled up 40 ft., and the walls of the hole were wet. We couldn't understand this until the next day, when the manager came around and said that he had been around Sunday with some friends and had run some water down the hole just to show how it was done. I looked at Slade and he was purple hued with rage. The water had started the walls to sloughing.

Tuesday, when we came on, the other driller had got the tools stuck and the hole had filled up over them. In trying to get loose he had broken the cable. Slade went to the nearest well, about ½ mile away, and got a horn socket and a combination socket. He run the horn socket and chopped up the rope and cavings until he got the neck of the rope socket clean and then run down with the combination socket and it slipped over the neck of the rope socket and when we pulled on it, three things called 'slips' wedged down around the neck, and then we 'hitched on' just as if we were drilling, only the blow was up instead of down. After jarring nearly three hours we got the tools out.

This may sound easy, but when you remember that it was all 600 ft. under ground, and done by suggestions of years of experience, good judgment, and a lot of guess work, it is not so easy.

It puzzles me the sangfroid and aplomb that these fellows possess. They cannot see what they are doing, but they seem to know.

Slade knows just what the tools are doing by looking at the rope, and I am blessed if I can see any difference in the jar, or anything else, but when he says "throw in the rope, she's getting muddy" I always note that the sandpumpings are thick.

Well, we put in about thirty joints of 10-in. pipe —thirty-five lb. to the foot—and after we had gone about 100 ft. deeper we struck water and sand. The drilling was very slow and we had to underream to get the pipe down.

A few days ago a big pebble rolled in alongside of the pipe and dented the bottom joint so that the shoe came off and we had to pull the casing all out to put a new shoe on. Of course, the hole filled up about 100 ft., which had to be redrilled.

The shoe is a piece of steel that goes on the bottom of the casing to protect it. It is slightly larger, outside diameter, than the casing couplings, so that whatever it goes through, the casing will follow.

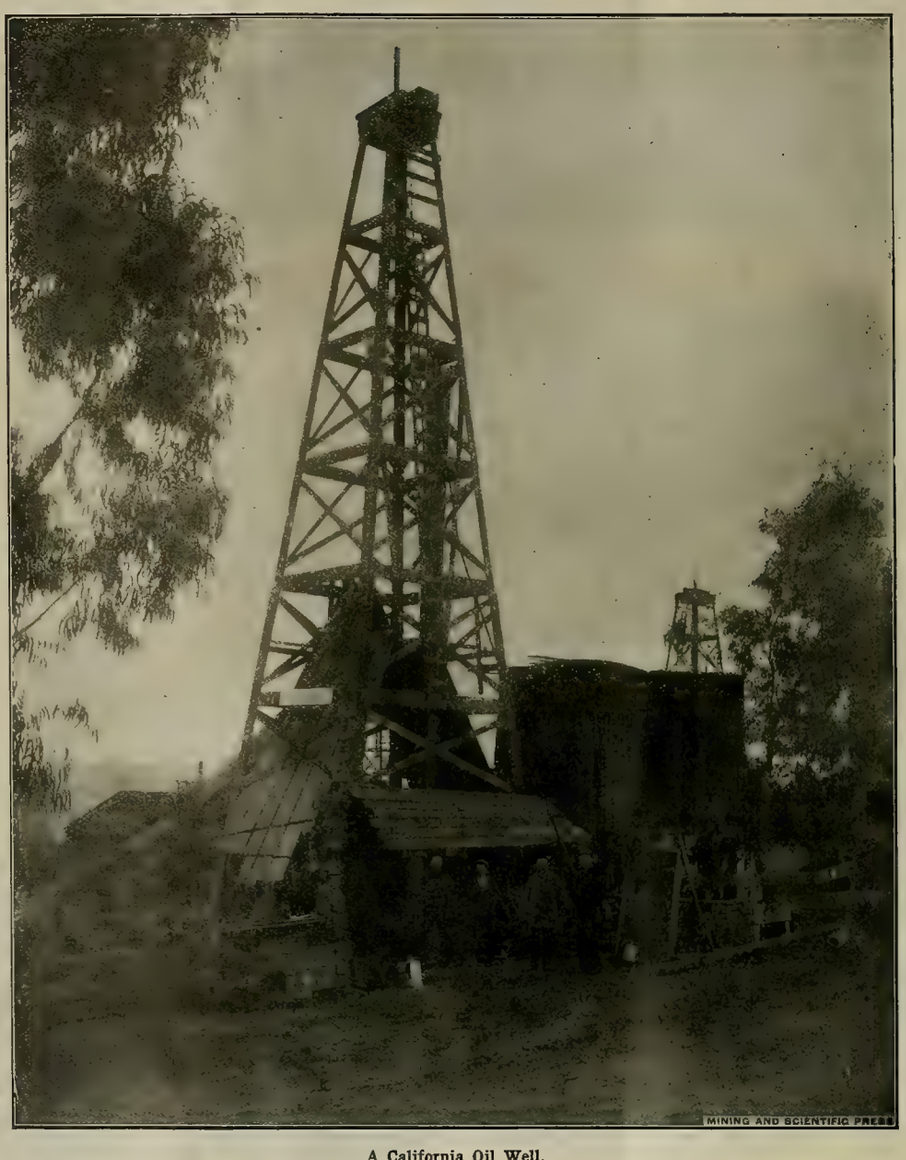
We are close to the oil sand now—if we get it—and expect to get it next week.

Great heavens, John, I cannot describe the workings of all these tools. Get an oilman's encyclopedia and hunt them up. You will be asking what that is, so I will say it is an oilwell supply catalogue, and, as there are something over 500 pages in it and three or four times as many illustrations, you may realize why I cannot describe the whole thing in a letter.

The underreamer is a tool that spreads out when it gets under the casing and shaves off the sides of the hole already drilled, so that the casing will go down.

No, I have not struck oil. You know your Burns and the oil business is something that can not be planned on paper.

We got the casing 'froze' and broke the calf-wheel. We run 2,000 feet of cable off the bullwheels, put our calf line on the bullwheels and pulled the top of the derrick so nearly in that it had to be reinforced. By that time the pipe was so tight that the other driller and the manager were ready to run in another string of smaller casing, but Slade stuck to it, got the pipe working 1 in., then 2 in. then a foot, and finally loose. We are in the sulphur water on top of the clay that is over the oil. *We may get oil next week.* Yours, JIM.



A California Oil Well.

THE explosion of a homogeneous substance is due to a decomposition, that is, a chemical reaction in the interior of the substance, and is generally brought about by a violent shock caused through the detonation of a primer, commonly called the detonator. Any energy resulting either from the shock of an exploding primer or a heavy blow will, if resistance be encountered, be transformed into heat. This transformation will, owing to the suddenness of the shock, take place in the first layers reached. Assuming that the heat thus developed is high enough to decompose this thin layer of substance, the sudden formation of great quantities of gas will produce a new shock, which will doubtless be more violent than the original one. The resistance of the surrounding layers will change the energy of the new shock again into heat, which in turn will cause the decomposition of another quantity of the explosive and so on, until the whole mass of it is exploded. It will thus be seen that if the energy developed by the decomposition of the first portions communicates itself to the neighboring parts, so as to determine step by step the decomposition of the whole mass, we shall obtain a complete detonation as the result of the shock.—E. H. Weiskopf, *Chem. Met. Soc. of South Africa.*

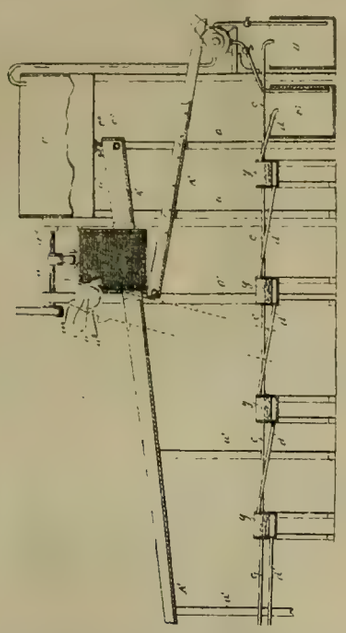
THE new steamship *Amerika* of the Hamburg-American line is the largest boat afloat, as regards her displacement of 40,000 tons. She is 700 ft. long and 74 ft. wide. The *Baltic* is 725 ft. long and 75 ft. wide, so that as regards dimensions the *Baltic* is still first on the seas. The *Amerika* can carry 16,000 tons of cargo and accommodates 23,057 passengers, not including the crew of 520 men. She is propelled by twin screws driven by quadruple-expansion engines, calculated to give a speed of 18 knots, so as to make the crossing from New York to England in about seven days.

Mining and Metallurgical Patents.

PATENTS ISSUED DECEMBER 12, 1905.

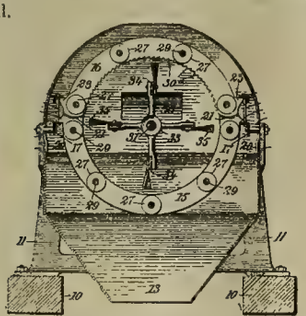
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

MINING MILL.—No. 806,145; F. J. Hoyt, Chicago, Ill.



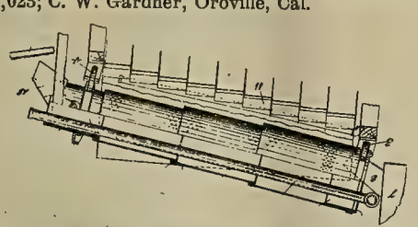
In mining apparatus, combination in one structure of shaking screen, chemical sluiceway, both inclined, latter placed directly under screen, and both joined at their heads at point of ore and chemical solution supplies, amalgamating apparatus forming part of same structure and receiving run both from screen and sluiceway, sluiceway having extension beyond amalgamator, revolving tail screen at end of extension, tail tank for receiving solution, over which screen revolves, receiving tanks under head of machine, return pipes from tail tank to head tanks, zinc vats on line of pipes in which solution is precipitated on way back to head, and pumping means to pump solution from head tank or tanks back to original supply tank, whereby continuous constant operation of mill and continuing circulation of solution around mill are obtained.

PULVERIZER.—No. 807,136; Nickolas Spurgin, Ottawa, Ill.



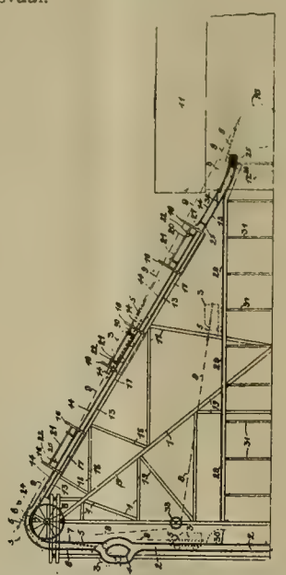
In pulverizer, combination with chamber comprising series of rings tapered outwardly throughout peripheries and having integral bosses extending from tapered portions, bosses being provided with openings, of tie-rods extending through boss-openings and serving to draw outer faces of bosses to a bearing, and beater rotatable within chamber.

GOLD WASHING AND SEPARATING SCREEN.—No. 807,023; C. W. Gardner, Oroville, Cal.



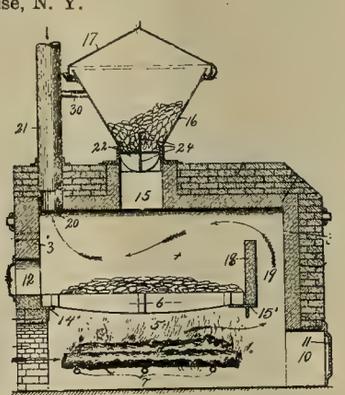
Inclined, tubular, revoluble screen consisting of perforated metallic sections of gradually decreasing diameter, sections each having uniform diameter from end to end and having overlapping meeting ends, rings to which meeting ends of sections are secured, rings forming dams adapted to retard passage of material and cause same to overflow into smaller succeeding sections, tread-bands surrounding screen, rollers upon which bands are supported and through which motion is transmitted to screen, and thrust-bearing rollers adapted to prevent longitudinal movement of screen in direction of its axis.

WINDING OR HAULING APPARATUS FOR MINES AND THE LIKE.—No. 806,857; E. G. Weldon, Johannesburg, Transvaal.



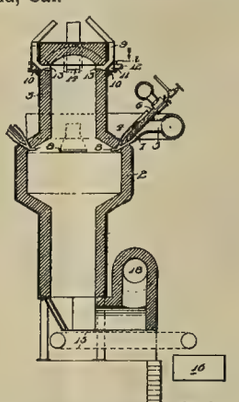
In winding or hauling apparatus of nature specified, combination with head gear and pulley wheel, round which hauling rope passes, of track for skip or cage passing over head gear and pulley and extending in direction of pull of hauling rope, and connections for drawing skip or cage past parts as far as desired and freely thereof.

REDUCTION FURNACE.—No. 806,127; F. W. Field, Syracuse, N. Y.



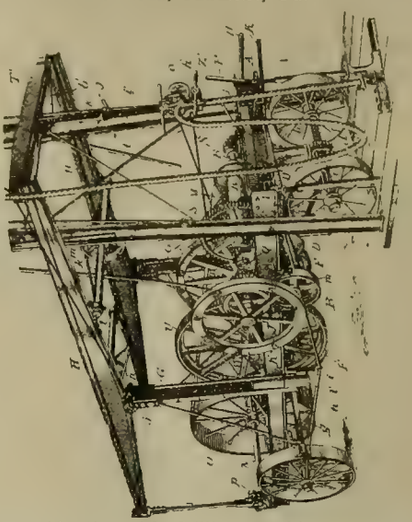
Furnace comprising front and rear walls, side walls, top and bottom, front wall having transverse ledge on inner side thereof, T iron having portion of its head on one side of web seating on ledge and having web engaging front wall, second T iron secured to side walls and spaced from rear wall, grate seating on head of first named iron and on portion of head of second named iron, and transverse wall seating on remainder of head of second iron and extending considerably above grate.

PROCESS OF TREATING ORES.—No. 806,774; H. F. Brown, Oakland, Cal.



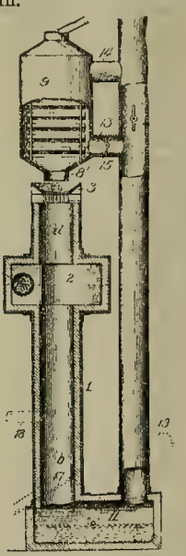
Process for treating finely divided iron ores which consists in reducing same while in atmospheric suspension and during such suspension causing reduced particles to agglomerate into clinker, bonding of ore being caused by resultant spongy condition thereof.

PORTABLE DRILLING MACHINE.—No. 806,886; H. S. Glenn and C. E. Glenn, Oakmont, Pa.



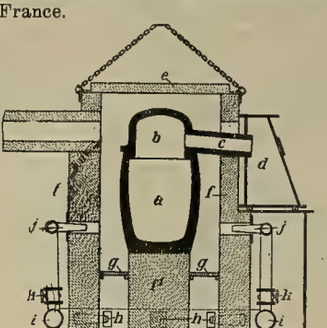
In combination with drilling machine, comprising main frame, engine, walking-beam, drill rope drum, sand-pump rope drum, casing rotating drum, and brakes for drill rope and sand pump rope drums; levers H′, K′, L′ and P′, serving to control movements of walking-beam, drill-rope drum, sand-pump-rope drum, and casing-rotating drum, all brought into close proximity at forward end of machine, whereby driller without leaving his drilling position is enabled to manipulate levers and control several mechanisms.

PROCESS OF REDUCING ORES.—No. 12,424; H. F. Brown, Chicago, Ill.



Process of treating finely divided ore, which consists in subjecting it, while in atmospheric suspension, to preliminary heating atmosphere, then to action of reducing, fusing frame and at same time gradually bringing particles of ore into approximate physical contact.

PROCESS OF EXTRACTING METALS FROM THEIR SULPHIDES.—No. 807,271; A. H. Imbert, Grand Montrouge, France.



Process of extracting zinc and lead from complex ore containing blende and galena, consisting in adding to ore necessary copper and fluxes; in heating mixture to vaporization temperature of zinc, but maintaining lead at temperature below vaporizing point of latter metal, in condensing vaporized zinc and drawing off the molten lead; in separating the resulting scoriæ and copper sulphide; and in recovering copper from sulphide, in order that it may be used over again.

MINING SUMMARY.

Specially Compiled and Reported for the MINING AND SCIENTIFIC PRESS.

Special Correspondence.

TORONTO, January 2, 1906.

Notwithstanding that the prospecting season is closed owing to severe winter weather, interest in the Cobalt mining area continues unabated, being stimulated by frequent reports of rich finds of silver-cobalt ore in the mines now in operation. Recently a mass of almost pure silver weighing 250 lb., accompanied by two smaller nuggets of about 30 lb. each, was found on a property owned by A. M. Wylie, of Port Arthur, and J. B. Pardee, of Sault Ste. Marie, near the celebrated University mine. The question of the permanency of the camp occupies the attention of mining men and scientific experts, doubts having been expressed as to whether the rich deposits would hold to a lower level. Among the mineralogists who have lately studied the field with this end in view are Dr. Robert Bell, of the Dominion Geological Survey, and Prof. Hidden, of Newark, N. J., who have not yet announced any definite conclusions on the subject. A diamond drill employed for the purpose of testing the depth of the vein in La Rose mine had, at last accounts, reached a depth of 340 ft. and found the ore as rich as that near the surface. It would hardly be safe, however, to draw any general conclusions from this encouraging result. Prof. W. G. Miller, Provincial Geologist of Ontario, states in his recent report on the field that the veins, which occur in the Lower Huronian formation, do not appear to cut through the older Keewatin series, which underlies it unevenly. The depth to which a vein may descend therefore depends upon whether the formation occupies an old valley of underlying Keewatin, or lies above a former hilltop. Actual mining appears to be the only means of arriving at a conclusion.

According to a statement issued by the Ontario Bureau of Mines covering the first nine months of 1905, the total shipments from the silver-cobalt mines for this period amounted to 2,400,000 oz. silver valued at $1,300,000; the other valuable constituents of the ore—cobalt, nickel and arsenic—being worth $83,500. The metals other than silver are placed at a low valuation because, in the absence of smelting facilities the ore has to be shipped to New York for treatment and few of the buyers allow anything for the cobalt, nickel and arsenic contents, alleging the refractory character of the ore as an excuse. About 25 properties are now being actively worked in the Cobalt area. The opening of spring will undoubtedly witness a great rush and a considerable extension of the field, especially to the north, railroad extension having given access to a new district supposed to be as rich as that around Cobalt. The Temiskaming & Northern Ontario Railway, a government line now in course of construction, has reached a point 40 miles north of New Liskeard, lately the terminus. The investigations of Dr. W. A. Parks, of the Dominion Geological Survey, in the district lying north of Lake Temiskaming, establish the fact that while the metalliferous rocks of the present scene of operations are interrupted to the north by other formations, beyond these again there occur extensive deposits of a similar character to those of the Cobalt area. Some claims have indeed already been taken up, and it anticipated that the district along the route of the railway will witness a great influx of prospectors and mining men. The undoubtedly rich tract immediately to the south is at present forbidden ground to prospectors, as 60,000 acres is included in the extensive timber limit of Gillies Bros., and according to the present regulations it is not open to location. Several valuable finds have been made there and strong pressure has been brought to bear upon the government to have it opened to prospectors.

In December a conference of mining men was held here at the request of the Provincial government in order to ascertain the views of those connected with the mining industry, respecting proposed changes in the mining law. Recent developments and the growing importance of mining have rendered necessary a complete revision of the system. The attendance, numbering about 120, was thoroughly representative of the different mining districts. The conference lasted four days, closing on December 15. Prominent among the questions considered was that of the restrictions on prospecting under which the public lands under timber licenses and the forest reserves are closed to prospectors. A resolution was adopted expressing the opinion that all public lands, whether timbered or otherwise, should be open to location. Another matter on which the conference was practically unanimous was that prospectors should be allowed to locate without having made any actual discovery of valuable mineral. At present no claim for a location can be received unless evidence of such a discovery is furnished. A resolution in favor of permitting location without this condition was adopted, it being provided, however, that the locator must, within 90 days, expend $100 on his claim in actual mining development, the expenditure being calculated on the basis of $3 per day for a man's work. The abolition of all royalty, or special tax on mining, was urged. Hon. Frank Cochrane, Minister of Lands & Mines, to whom the resolutions were presented, stated that they would have great weight with the government.

In amending the law, the government has an intricate problem to face, especially in regard to the conflicting claims of the miners and the lumber operators, who hold large areas of timbered land under license. The title to the soil remains vested in the government, all that the lumbermen got being the right to cut the timber. The latter, however, are strongly opposed to any proposal to give prospectors the right to locate within their limits, alleging that to throw the timbered lands open to mining would greatly increase the danger of forest fires. As the sales of timber furnish the largest source of provincial revenue, it is hardly likely that any such sweeping change as that recommended by the conference can be carried out, though something may doubtless be done in individual cases, such as that of the Gillies limit near Cobalt, where veins of exceptional richness exist, to permit of mines being opened.

ALASKA.

Consul Ravndal of Dawson, Yukon, finds that the total output of gold in Alaska for the season of 1904–5 exceeded $14,000,000, as compared with $9,067,325 for 1903–4, and as against $6,352,028 for 1902–3.

ARIZONA.

On December 28, in Phœnix, the organization of the Arizona Miners' Association was completed. The by-laws are patterned after those of the California association. After organization, C. M. Shannon of Clifton was elected president; E. Randolph, president; C. H. Akers, secretary; Wm. H. Brophy of Bisbee, treasurer. After the adoption of the report of the resolutions committee the chair named the following as members of the executive committee: A. E. Haggett, Yavapai; Lamar Cobb, Graham; A. H. Smith, Mohave; S. L. Gibson, Gila; C. M. Clark, Maricopa; W. P. Twitchell, Pinal; Mr. Forbes, Pima; E. L. Crowell, Santa Cruz; Walter Douglas, Cochise; Mr. Burbage, Navajo; T. E. Pollock, Coconino, and J. T. Hogue, Apache.

Graham County.

The report of the Shannon Copper Co. of Clifton for the year ending Aug. 31, 1905, shows that development during the year covered 11,931 ft. at an average cost of $3.46 per ft.; 2,810 ft. was in the vertical direction and cost $3.27 per ft.; of the whole distance, 3,352 ft. was in ore. Some of the old stopes have been exhausted, but additions to reserve have more than kept pace with extraction. A gradual decline in its value is indicated by a less proportion of smelting ore and by a smaller amount of copper in it. The whole output of ore from the Shannon mine was 188,856 tons; its average content was 4.08% copper. Smelting ore, carrying 5.15% copper, constituted 53,353 tons, or 28% of the whole. Concentrating ore, carrying 3.66% copper, to the amount of 135,503 tons, showed a gain of 48% over its proportion in the preceding year's output. The levels below the Boulder tunnel accounted for the increased extraction, all stopes above that level having reduced their outputs. Ore from the open cuts, carrying only 2.2% copper, is mined for an iron flux, but only in quantities required by the smelter. The cost per ton for mining 188,856 tons was $2.138, the leading items being: Mining, 93.2c.; timbering, 50.1c.; tramming, 11.2c.; development and exploration, 21.7c.; filling, 5.6c.; sampling and assaying, 4.8c. One of the company's outlying claims, the El Paso, contributed 279 tons of ore carrying 15.5% of copper. This group is being explored by a tunnel along the limestone contact. The mill was running only two-thirds of the time, owing largely to interruptions in transport, due to heavy floods. Crude ore is now being screened before crushing, and the fines are briquetted to save excessive losses of oxidized ore in the mill; magnetic concentration and picking the ore are expected to reduce losses of these oxides in the tailing. The mine product is classified into two grades, the higher being smelted at once, and the lower being concentrated before smelting. The furnace put through a charge of 128,724 tons in the course of the year; it was made up of 52,926 tons of Shannon ore; 3,519 tons of custom ore; 29,735 tons of concentrate; 3,831 tons of fine ore; 12,949 tons of flue-dust, and 975 tons of copper slag. A converter plant is under construction, and a blower engine and other plant were added during the year. For converting matte, the company has heretofore depended upon its neighbors. The year's output was 11,414,271 lb. fine copper as against 10,788,891 tons in the previous year. Of gold, 592 oz. and of silver 17,127 oz. were sold. The average price received for copper was 14.24c. per lb. The gross proceeds of sales were $1,631,317, and stock of metal was increased by $60,177; operating expenses were $1,126,248 (9.87c. per lb.), construction and development to the amount of $52,321 was charged against earnings, and selling and miscellaneous general expenses were $241,772, showing a net profit of $271,153 on the year's work. Expenditures of $45,650 were charged to capital for permanent improvements.

Maricopa County.

The miners' drilling contest at the Arizona territorial fair resulted as follows, contestants drilling 15 minutes each: Double-hand drill team of Ross & McIvy, 40⅞ in., Page Bros., 39⅞ in. The latter team earned the championship at El Paso. Fred Yockey won the single-hand contest, drilling a fraction over 21 inches.

Mohave County.

(Special Correspondence).—The West Gold Road Mining Co., at Acme, have suspended work, pending equipment and increased operations, as they have struck the ledge at a depth of 260 ft. J. D. Spargo of Acme has been superintendent.

Acme, Jan. 2.

On the 300 level of the Vanderbilt mine, at Cerbat, the drifts are in rich gold ore.——E. F. Thompson has let a contract to sink the shaft on the Idaho mine, Cerbat, 50 ft. deeper.

The Kingman Smelting & Refining Co. has leased ground at Kingman on which to build a 250-ton smelter and 400-ton sampling works. Walter De Varilla is general manager.

Yavapai County.

At the 10-Spot claim of the Senator mine, near Prescott, a hoist is being put in to aid in connecting the shaft, now 250 ft. deep, with the Senator tunnel. An upraise will also be made from the tunnel. A. J. Pickerell is superintendent.——Development is to be resumed at the Storm Cloud mine, south of Prescott, by H. J. Beemer.

Judge Kent has decided the Old Vulture mine case in favor of the old owners. The mines at Wickenburg have been under the control of a watchman who was supposed to do the assessment work on them, but it is alleged that this he failed to do and they were relocated. The proof was made that with one exception the work had been done and the old company was quieted in its title to the property. It is now probable that the mines will be worked.——The Monarch Mining Co. intends to install electric machinery to furnish power and lights for the reduction plant. The power plant will be on the Hassayampa river between Wickenburg and Hot Springs Junction. C. W. Platt of Wickenburg is superintendent and J. B. Tomlinson of Prescott consulting engineer.

CALIFORNIA.

Amador County.

A big cave is reported from the Keystone mine at Amador City, from the 450 or 500 level to the surface near the north shaft.

El Dorado County.

The Stillwagon mine, near Grizzly Flat, is being reopened, under the direction of F. Davis.——The Wagner mine, near Lotus, is being opened up by J. B. Wagner.

Inyo County.

The Bishop Creek Consolidated Mines Co., which owns a low-grade gold property at the head of Bishop Creek, has begun development work under the management of R. T. Jones.

Madera County.

The Texas Flat mine, ½ mile west of Coarse Gold, is being operated under the direction of Wm. Lawrence. The 20-stamp mill has been started recently.——McKenzie & Rule are driving a tunnel to develop the Consolidated Four claims, near Coarse Gold.——A road is to be built to the Zulu mine, on French gulch, two miles from Coarse Gold. Machinery is to be put in.——Work has been stopped at the Westfall mine for the winter.

Mono County.

Papers have been signed between Boone, Carpenter, Montrose and Parker, comprising the Myrtle & Julia Co., and J. K. Weitfle and S. C. Eastwood of the No. 1 Pittsburg lease, wherein Weitfle & Eastwood are granted a five-year lease on ground in the Masonic townsite, near Bodie. This piece of ground was leased as a millsite and on it will be built a quartz-mill for the reduction of ores from the present W. & E. lease and custom rock.

Placer County.

It is reported that the Kittler mine, near Ophir, is to be opened up by Chas. Peach of San Francisco.

Plumas County.

It is reported that a rich strike has been made by H. Bicknell, of Los Angeles, and associates, 3½ miles north of the Duncan mines, near Greenville.

Santa Barbara County.

The Santa Maria chamber of commerce has issued a statement in reference to the oil production of the Santa Maria and Lompoc districts for 1905, compiled by Secretary L. E. Blochman. This places the total at 5,300,000, which is much higher than previous estimates. The estimated production in barrels, with estimated storage accompanying, for producing companies. is as follows: Union Oil Co. (including California Coast and S. M. Oil & Gas Co.), 3,500,000; storage, 1,000,000. Pinal Oil Co., 350,000; storage, 150,000. Brookshire Oil Co., 50,000; storage, 25,000. Santa Maria Oil Co. (Kaiser), 25,000; storage, 5,000. Hall & Hall, 25,000; storage, 5,000. Western Union Oil Co., 1,000,000; storage, 200,000. Graciosa Oil Co., 250,000; storage 25,000. Totals, 5,300,000; storage, 1,310,000. Of the above storage, over one-third is temporary in local tanks for engaged deliveries, and so only about 800,000 barrels is actual storage on hand. The number of producing wells is as follows: Union, including California Coast and Santa Maria Oil & Gas Co., 25; Pinal, 10; Brookshire 5; Santa Maria Oil Co. (Kaiser), 1; Hall & Hall, 1; Western Union, 25; Graciosa, 5; Los Alamos, 1. The number of wells drilling is as follows: Union, including California Coast and Santa Maria Oil & Gas Co., 20; Pinal, 1; Brookshire, 1; Pennsylvania Petroleum, 1; Rice Ranch, 1; Coblentz, 1; Goodwin & Tietzen, 1; Radium 1; Western Union, 5; Graciosa, 1; Cat Canyon district, 1; Palmer, 1; Recruit (Associated), 1; Pacific Oil & Transportation, 1; Escolle lease, 1; Newhall lease, 1; Syndicate, 1; Claremont (Union), 1; Southern Pacific, 1. The total number of producing wells is 73, drilling 42.

Shasta County.

The Uncle Sam gold mine on Squaw creek, eight miles west of Kennett, is being worked, under the direction of Superintendent Varden. The 20-stamp mill has been started.——The aerial tramway, which conveys the ore from the Mammoth mine 2½ miles to the smelter, has been put in operation. The timber is carried up to the mine by the excess weight of the ore coming down. The ropeway has a capacity of 1,000 tons daily. The excess of 100 h.p. will be used to run air compressors at the mines.

Tuolumne County.

(Special Correspondence).—Wm. Sharwood has bonded the Soulsby mine at Soulsbyville to Eastern people, who will sink the south or Pennsylvania shaft 300 ft. deeper and unwater and reopen the old Davidson shaft and sink it to the same level as the Pennsylvania. The two shafts are to be connected from the bottom level.

Soulsbyville, Jan. 2.

Trinity County.

The first payment has been made on a bond held by Eastern capitalists on the Paulsen placer claims, near Douglas City, seven miles below Weaverville. The group includes the Dutton's Creek mine, the Union Hill and the Last Chance. Water to work the mine will be taken out of Grass Valley creek. The conduit for carrying it across the canyon will be an inverted siphon of 600 ft. depression. The cost of equipping the mine for hydraulicking will be great.

Yuba County.

The Bear River Dredging Company, near Wheatland, is preparing to enlarge its plants by having two more dredgers built.

COLORADO.

(Special Correspondence).—During the coming year a number of large enterprises are contemplated and several of them are under way in this State. The Moffat road is being pushed as rapidly as conditions will permit. Work is now progressing in Gore canyon, over which there has been a controversy between the road and the Government. This obstacle has been removed and things are progressing. It is understood that the big tunnel to pierce the Mosquito range between Alma, in Park county, and Leadville, in Lake county, has been financed, and work will commence in the spring as soon as the weather will permit. This project, if carried through to completion, will mean considerable to the two counties mentioned, as well as the State at large. The projected Vidler tunnel, above Georgetown, in Clear Creek county, is also reported about ready to commence on a large scale. Considerable work has already been done on this tunnel, which expects to connect the railroads at Georgetown and Keystone, on the western slope of the Continental divide. This tunnel is to be used as railroad as well as mining. On account of the heavy snowfall in the San Juan country near Silverton, buildings of different kinds have been abandoned. The Gold Prince mill at Animas Forks has to be abandoned, as the railroad was unable to deliver the freight necessary to keep the work moving. Work will be commenced in the spring as soon as possible.

Denver, Dec. 30.

Clear Creek County.

In the Schraga property, up Banner gulch, on Chactaw mountain, near Georgetown, a lode was cut 800 ft. from the portal of the crosscut tunnel. Drifting has been started. The property has been operated by William Schraga.

The Georgetown Loop M. Co. has been formed to work claims on Republican mountain, between Silver Plume and Georgetown. Geo. Albertson of Denver is president. The company intends to put in machinery to continue their tunnel for 2,000 ft. to open the veins.——The Dives-Pelican mill is to be started on high-grade ore from the Bismark mine.——A strike of high-grade ore is reported from the Aspen Promise group, on Leavenworth mountain, which is being worked by the Silver Plume M. Co. Ed. Butts is superintendent.

The Key West mine on Leavenworth mountain, near Georgetown, is to be worked by a new company, of which E. W. Shepard is manager. The value is chiefly in silver and in zinc.——The heading of the Central tunnel is in 4500 feet.

In reviewing tunnel progress the Georgetown *Courier* states that the Vidler tunnel in East Argentine, which recently installed a fine power plant, is being pushed through the main range, to be used for mining and railway purposes. The company contemplates installing another plant of machinery on the opposite side of the range next summer and driving the tunnel from both ends.——The Wilcox or Argentine tunnel, owned by the Waldorf Co., will open at depths varying from 1,000 to 2,500 ft. many claims. At the last meeting it was decided to construct a tunnel from the Silver Plume side of the mountain, 12,000 ft. in length, to intersect 1,500 ft. below the present workings.——The Sidney tunnel is driven to cut at great depth a number of rich veins on Pendleton mountain. The company installed a plant which is driven by water power, enabling them to drive their tunnel at less cost per foot than any other tunnel in the county.——The Leavenworth Mountain and Domino Companies are driving tunnels to intersect their holdings on Payne's Peak.——The St. Paul Co. has put in machinery to drive a tunnel 1,500 ft. to open claims.——The Silver Plume Co. has adopted the tunnel system and is pushing the Butts tunnel to cut the Rising Sun and other lodes on Leavenworth mountain.——Negotiations are pending whereby the Doric tunnel, which has been driven into Griffith mountain over 3,000 ft., will probably be in use again to work the Griffith and other mines.——The Kelly tunnel, which has been driven into Democrat mountain 3,200 ft., will soon pass to the control of the Democrat Mountain Co.——The Joplin tunnel, being run by B. J. O'Connel to develop the Gambetta and other lodes, is in 100 ft.——The Scepter tunnel, owned by the Red Oak Co., is being driven to get under ore shoots on the Sunburst.——The Prudential and Montgomery Ward tunnels on Republican mountain are each in 400 ft.——The Lincoln mountain and the Ramsdale tunnels have been driven a little more than 400 ft. each.——The Empire tunnel, driven to cut all the veins of the Empire district, is in 3,000 ft.——The several Santiago tunnels, driven to develop the Santiago mine at various levels, aggregate 2,300 feet. Among the older tunnels are the following: The Burleigh, the first long tunnel run in the State, is in 2,400 ft.; Diamond tunnel, 2,000 ft.; Ashby, 2,200 ft.; Snowdrift, 600; Baltimore, 800; Helmick, 600; Lebanon, 1,000; Republican Mountain, 800; Pulaski, 800; Eclipse, 1,000; Bonanza, 1,000; Hidden Treasure, 1,000; Hall, 3,000; Central Colorado, 600; Cosmos, 1,200; Abeel, 700; Empress, 3,000; Conqueror, 600; Sturm, 600; Capital Prize, 1,800. The Two-and-a-half tunnel and level on the Pelican is the longest in this district, being one and one-half miles.

Gilpin County.

The output of Gilpin county mines for 1905 is 25% higher than that of 1904, owing to closer sorting of the ores sent to the mills and smelters. Many new shaft buildings have been put up and much new machinery put in. Several properties that have been inactive for some time will be started up in the new year. Five new mills are under construction. The Running Lode, Old Town, Pittsburg, East Nottaway, Alps and other properties have been paying dividends during 1904. The leasing system has been broadened. The results are seen in the increased tonnages of mineral and the number of producing mines. The Pleasant Valley Mining & Milling Co., operating veins on the Banta ranch, has the Hill shaft down 420 ft. When the mine has been unwatered to the 250-ft. level ore-breaking is to be started. From the 350-ft. level drifts will be run southwest to the Black Cat, Margaret and American Flag lodes. The Gold lode has been unwatered and will be piped from the Hill shaft to operate machine drills. On the Clive shaft a new shaft-building has been put up and may be worked under lease. The first unit of the company's new concentrator is expected to be completed by February 1. The total capacity of the completed two units will be 100 tons daily. It is expected that the Gilpin Tramway lines will be completed 3½ miles from Willis gulch to the mines by the end of the month.——The Colorado & Southern, owning the ore tramway system, has extended its tracks to every prominent mine not touched by the previous management. Improved concentration has taken the place of imperfect methods.

The Forks & Randall extension claims on Quartz hill, Nevada district, near Central City, are to be equipped with a hoist and new shaft-house. The shaft, now 350 ft., is to go deeper.——Bids are being asked for sinking the Grand Central on Gunnell hill, Central City, 200 ft. farther, the shaft being down 400 ft.——Hawn, Stephenson & Horning are putting up a 15-stamp mill in South Moon gulch, near Rollinsville, to handle the ore of the Smuggler mine, which has been developed by a 300-ft. tunnel.

The Nancy Hanks, northeast of Apex, is developed by two tunnels. W. D. Converse is owner.——The Mary property, on Silver creek, is being developed by J. F. Colby. It is reported that machinery for shaft sinking is to be placed on the Palace claims, west of Silver creek.

The following list of Gilpin county stamp mills is taken from the *Register-Call:*

Mills. Location.	Stamps—Slow	Stamps—Rapid
Climax, Black Hawk	25	..
Fullerton, Black Hawk	33	..
Hidden Treasure, Black Hawk	75	10
Meade, Black Hawk	40	..
Polar Star, Black Hawk	40	..
Eagle, Black Hawk	..	35
Boston & Denver, Black Hawk	..	80
Gilpin, Black Hawk	50	..
Rocky Mountain, Black Hawk	25	..
New York, Black Hawk	50	20
Randolph, Black Hawk	50	..
Penn, Black Hawk	50	..
Iron City, Black Hawk	..	25
Bonanza, Chase Gulch	25	..
Gregory-Buell, Mountain City	..	45
Perigo, Gambell Gulch	..	25
Gold Dirt, Gambell Gulch	..	25
Monarch, Gambell Gulch	10	..
Peterson, Lump Gulch	15	..
Avon, Nevada Gulch	..	30
Mountz & Pal., Pine Creek	..	10
Blue Grass, Phœnix	..	10
Caledonia, Wide Awake	10	..
Totals	498	325

Gunnison County.

A. E. Sanders, superintendent and general manager of the Lanyon Zinc Co., operating north of Pitkin, has struck a 3-in. pay streak of zinc and silver ore.——The Ben Franklin mine and mill, near Pitkin, are being worked by A. B. Clark.

Lake County.

At the bottom level, 950 ft. below the surface a drift is being run from the Penrose shaft north toward the Coronado. The drift will be 125 ft. below the bottom of the Coronado, and an upraise will be made to make a bottom connection. When this is completed hoisting can be done at either shaft or from both mines.——The tunnel connecting the Adams and Wolftone shafts at Leadville is almost completed. It will be 515 ft. long.

During the coming year Leadville will ship manganese ore. A contract has been made with the Illinois Steel Co. for 20,000 tons from the Gray Eagle mine under the control of the Western Mining Co. This shaft, east of the Penrose mine, has been idle a number of years. It is known to contain a large body of manganese, but the demand ceased for this product several years ago and since then the property has been idle. The contract with the Western Mining Co. calls for 15,000 tons, and G. W. Cook will secure 5,000 additional from other properties.

The close of 1905 finds mining in Lake county in a more prosperous condition than it has been for years, according to the Denver *Post*. The older properties in the Leadville section are producing more ore and of a better grade. At the Coronado an immense body of lead silicious ore has been opened. The present output is 300 tons daily.——After a hard fight for over 10 months against water, the Penrose shaft was sunk to a depth of nearly 950 ft., and at the bottom station three large pumps were installed, with a capacity of 2,500 gallons of water per minute, sufficient to control the entire inflow from the down-town section. When all the connections are made with the different properties owned by the Western Mining Co. in this basin, this shaft will be used as the principal pumping shaft, all the water being diverted to it, thereby lessening the cost of mining at the other properties.——During the year the Cloud City, to the west of the Midas, has deepened its shaft several hundred feet; also that of the Home Extension, made connections between the two, and is now developing a large body of iron.——The Bohn shaft, on East Second street, that started up a few weeks ago, is sinking to catch the Coronado ore shoot to the south.——In the Poverty Flats section several properties are working, and a few of them shipping iron. The Northern is turning out 125 tons daily. Other mines are sinking and prospecting for the Fryer hill shoots that trend through this section.——The monthly output of the Yak tunnel is 8,000 tons, coming from the Silver Cord, Bob Ingersoll and Tankerstown. The mill turns out 200 tons of concentrates daily.——Property owners on Iron, Breece and Jonny hills are running laterals from the tunnel to their mines. In 1906 the tunnel may be driven to Big Evans basin to drain the whole of that section.——The two great zinc producers of the camp are the Moyer, belonging to the Iron, Silver Mountain Co., and the A. Y. and Minnie, owned by Graham & Guggenheim. The total output for all classes this year will be close to 150,000 tons. The production of zinc will average 10,000 tons per month, the balance being iron, copper, and lead sulphide.——The Tucson, the extension of the Moyer to the east, is sinking a large shaft to a depth of 1,000 feet. The diamond drill went through ore 185 feet thick. The average output of zinc from the A. Y. and Minnie is 8,000 tons per month, with 2,000 tons of crude ore.——On Rock hill ore has been opened at the Murphy shaft, the Dome and Sequin. At the Bessie Wilgus the results have been less satisfactory. The output from the Reindeer will average 80 tons a day for the year.——The Nil Desperandum in the lower level is in iron. The Columbia is shipping an average of 20 tons daily. At lower Rock hill the only shaft now at work is the Mike, which is down 550 feet. Another 100 ft. should bring it well into the contact, when drifting will be started. The total tonnage for the year will be over 900,000 tons, and the value will come close to $13,000,000.

Summit County.

The estimated value of Summit county's mineral for 1905 was $815,000; gold, $301,000; silver, $239,000; lead, $123,500; zinc, $128,500; copper, $8,000; and crude iron, $15,000.

In an annual review the Summit county *Journal* states that the Banner placer, near Breckenridge, under Manager Kingsbury, has put in storage reservoirs, ditches and roads; 4,500 ft of 24-in. and 22-in. steel placer pipe, with lateral pipes to three giants and to an electric light and power plant, have been placed in position, and a two-months' run on the gravel has been made. The giants play on the 18 to 40-ft. banks under a pressure of a 308-ft. head. The alluvium passes through a sluice four feet wide, lined with self-clearing angle-bar riffles that save flour and coarse gold. A concentrating plant has been put in to make a smelting product of the heavy black sand saved by the under currents. The Revett dredge boat of the Reliance Gold Dredging Co. was completed during the summer, and has fulfilled the expectations as to capacity and adaptation. With 44 buckets a continuous stream of gravel is poured into the sizing and revolving screens. After screening (to remove boulders larger than four inches in diameter), a centrifugal pump discharges the material into a set of sluices lined with manganese-steel riffles, which retain the gold. The working season for dredging in Summit county is said to be 250 days per year; the capacity of the dredger is stated to be 3,000 cu. yd.——The American Gold Dredging Co. operated the Peabody and its other high-bar placers during the season, and drilled to locate the old channel of the Swan river for next season's dredging.——The Salt Lick placers, near Dillon, and additional territory, making 1,560 acres, have been consolidated and will be operated next season by the Buffalo Placer M. & M. Co.——The Mekka Gold Mines Co., operating on placer ground in French gulch, continued the construction of its long-drainage sluice toward the old elevator pit, and, on its way, worked off a bar that is said to have yielded $25,000. This drainage-sluice is being constructed to operate the big pit with giants. Mark G. Evans of Denver is manager.

The old Union M. & M. Co. is driving a crosscut tunnel which is in over 1,210 ft. and but 300 ft. more are required to bring it under No. 2 shaft. The mill has proved itself adapted to concentration and separation of the values in low-grade ore and is shipping about two carloads of its zinc, lead and iron products per day. Manager A. E. Keables supervises the mill work, and George C. Smith controls the mine. The Colorado & Wyoming, on Mineral hill, has produced the heaviest tonnage of lead and zinc ore of any mine in the county. The crude zinc now nets the owners $12 per ton on board cars in Breckenridge.——The Abundance Gold M. & M. Co., on Mineral hill, during the year erected a good hoisting and pumping plant, sank a shaft 255 ft., drifted 300 ft., and is now driving a tunnel to be 1,200 ft. long and to cut the vein at a depth of 575 ft. from the surface. John G. Goodier is manager.——The Beaver Creek Gold M. & M. Co. has put the Lucky mine on the list of active shippers of smelting ore. The main working shaft is to be put down 100 ft. and a new level started. F. A. Yauger is manager. The exploration tunnel being driven into the north slope of Mount Baldy by the French Creek Gold Mines Co. is in over 1,800 ft.——The Sallie Barber mine, on the crest of Nigger hill, has become a shipper of zinc ore.——On Gibson hill, the Bullion King is producing zinc ore, under leasing operations by Foote & Hight.——Portions of the old Oro property are being worked by John McGarvie and A. E. Keables. The old mill tailings from this mine were found to contain sufficient zinc to warrant concentration.——On Mount Baldy the Morning Star has been worked by Condon & Shrock, who have made connection between the tunnel and the main shaft. They made frequent shipments during the year.——The Carbonate and the Little Tommy group have been purchased by the Buckeye M. & M. Co. A five-stamp and concentrating mill was put in at the tunnel-mouth of the Laurium.——The Silver King, on Nigger hill, has been developed by Widmar & Dean, lessees.——The Novelty, on Nigger hill, owned and operated by Detwiler & Keables, will soon have its ore tapped by a new shaft.——The Dunkin mine, on Nigger hill, after two years' idleness, has been leased to Baird Bros., of Leadville.——In Swan valley, the Carrie property, with its stamp-mill and cyanide plant, on the north slope of Wise mountain, was recently sold to S. F. Stoughton, of Stoughton, Wis.——In Summit gulch, the Acton-Lyman property has disclosed a vein of high-grade ore.——The Jessie, in Gold Run, has had a long run, under lessee management.

Teller County.

The United States Reduction & Refining Co. intends building a mill for the treatment of tailings at Colorado City. The plant will have a capacity sufficient to treat the tailings of the ore now treated by the company's two mills at Colorado City.——McLain and associates, leasing on the Mary Cachen at Victor, has made a new strike at a depth of 500 feet.

IDAHO.

Boise County.

A new electric power plant and dam are being built at Garden Valley, on the south fork of the Payette river, to supply electric power to the dredgers of Boise basin. This is expected to be in running order in time for the placer season of 1906. There are four large dredgers in the Boise basin, two of them of modern design and construction. Two more will be built next season.

Idaho County.

It is reported that the Thunder Mountain Gold Co.

will add five stamps to their mill near Oro Grande. W. Stoever is manager and S. W. Swing assistant.——A trail is being built from the Oro Grande to the Umatilla mine, of which W. C. Brower is superintendent. Work is to be continued throughout the winter at the mine.——H. V. S. Richards, manager of the Fairbanks Mining & Milling Co. near Grangeville, will continue work all winter.——A cyanide plant is to be put in to treat the ore from the Sunnyside mine near Roosevelt.——The Dewey mill at Roosevelt is said to be treating 50 tons per day of $10 rock. The company has 35 men at work.——A 100-ton mill is on the road for the Curran-Caswell Gold Mining Co., working the Mysterious Slide group, adjoining the Dewey. The lower tunnel is in 270 feet.——The flume and 10-stamp mill has been completed at the Thunderbolt mine of the Trapper's Flat Mine and Milling Co., three miles from Knox, on the Thunder Mountain wagon road.

Kootenai County.

The Marguerite G. M. & M. Co. intends to put a concentrator on the north side of Lake Pend d'Oreille, near Hope. J. Johnson is superintendent. Ore is to be shipped to the smelter at Sandpoint when it is completed.

Shoshone County.

The detailed statement of the operating expenses of the Bunker Hill & Sullivan Mining & Concentrating Co. at Wardner for the half year of June-November, 1905, shows that there were 177,240 tons of ore produced, of which 152,655 tons were concentrated. Stoping 24,540 tons of shipping ore cost an average of $1.568 per ton, of which $1.224 was paid for labor, $0.075 for explosives, $0.024 for illuminants, $0.002 for lubricants, $0.009 for iron and steel, $0.002 for miscellaneous supplies, and $0.180 for timber and lagging. The labor cost for stoping 152,658 tons of concentrating ore was $0.89, explosives $0.061, and a total of $1.164. Concentrating costs averaged $0.194 per ton, of which $0.123 was paid for labor and $0.071 for supplies. Tramming cost $0.055, of which $0.044 was paid for labor. Exploration, shipping, superintendent and office costs make a total of $1.652 per ton. The ore produced contained 467,047.93 lb. lead and 907,550.11 lb. silver, all valued at $2,457,345.40. Additional costs charged to exploration, shipping, assaying, surveying, litigation and improvements gave a total of $383,260.91 for Wardner expenditures.——Work is to be resumed on the Surprise group on the east fork of Pine creek, and owned by Kellogg people. The lowest tunnel cut the ledge when in 425 feet. The ore has been tested in the Bunker Hill & Sullivan mill and the results show that it is possible to produce 70% lead concentrates running 20 oz. silver to the ton and 50% zinc concentrates.——The Frisco mine at Gem is to be unwatered by Manager Ehrenburg preliminary to starting up.

MONTANA.

Granite County.

It is reported that the Nancy Hanks mine, near Garnet, is regularly shipping gold ore.

Jefferson County.

The Australia mine, five miles north of Boulder, is to be worked by J. Mulligan.——Wise & Eiper are reopening the Emmett mine, north of Boulder.——A dredger is being put in to work the Winter's placer, near Basin. Wm. Brazenall is agent at Basin.

Lewis and Clark County.

After an idleness of nearly 20 years, work has been started at the Whitlach-Union mine, near Unionville, south of Helena, under the management of the Whitlach Mining Co., in which A. W. Martin, H. N. Canoll and F. S. Sizer are interested. A new 20-stamp mill has been installed; an aerial gravity tramway 2,100 ft. long has been built to convey the ore from the mine to the mill; general and assay offices have been fitted up and bunk-houses for the men; a shaft 500 ft. in depth has been sunk; a plentiful supply of water can be secured from the mine for all purposes. A large air compressor has been put in and 10 machine drills. The compressor will be run by electricity and the mill also, the power being brought from the Canyon Ferry dam.

Silver Bow County.

(Special Correspondence).—The Raven Mining Co. will begin shipping ore from the Snoozer mine, upon which it has been doing development work since last June. Three copper veins have been opened in the ground, one of them for 2,000 ft. on the 1,200 and 800-ft. levels. The company has begun crosscutting from the shaft at the 1,500 level to get the veins.——The East Butte Mining Co. has taken over all the properties it has under option. They include the Lassen, Yankee Boy, Oneida, Mary MacLane, Dutton, Jackson, McDonald, Hoy, Hancock and Wheeler, all of which have been producing in a small way under operations by leasers who shipped only the first-class ore. About 150 tons of ore have been shipped daily, averaging 12% in copper, with gold and silver. The new company will soon increase the output to 500 tons a day. The company has purchased a site for a concentrator. It is possible that an offer of the Anaconda company to handle all the ore at the Washoe smelter will be accepted.——With the announcement that the Pittsburg & Montana Co. has been sold to the Mellen interests in Pittsburg for $30,000,000, it is predicted that the experiments that have been carried on with new smelting methods by Ralph Baggeley will be abandoned.

Butte, Jan. 2.

NEVADA.

Esmeralda County.

Whether Tonopah, which is the seat of Nye county, is in Nye or Esmeralda county, is a question that the courts of the State will have to decide. Since the discovery of the camp several surveys have been made, and it has developed that at least three of them place the greater part of Tonopah, along with the Nye county courthouse, in Esmeralda county. These surveys say the county line passes through Tonopah at the Sibert shaft. The land office holds this to be true as it requires persons applying for patents to lands to define those west of the Siebert shaft as being in Esmeralda. The entire dispute grows out of the location of the 38th parallel north. The State, in defining the boundaries of the various counties, provided that the west line of Nye should run northerly to the 38th parallel, and then strike westward at an angle of 45° to a given point. A number of capable engineers say the accepted location of the 38th parallel is erroneous; that it is several thousand feet farther north than reputed, which places the camp in Esmeralda county. The people of Esmeralda county have no intention of forcing Tonopah within their county, and if the courts pass upon the matter adversely to Nye county, the Legislature will be asked to move the line in such a manner as to leave Tonopah within Nye, where they think it belongs.

Work on the Big Injun mine, near Sodaville, is to be commenced under management of C. L. Barnes.

Ormsby County.

The Selby claims, six miles north of Carson, have been sold to Philadelphia people. A mill will be built and the mines worked on a large scale.

Storey County.

Satisfactory arrangements have been made with the Butters reduction plant near Virginia City to treat 100 tons of ore daily from the Tonopah Mining Company's property at Tonopah. As soon as the machinery can be received, the capacity of the plant will be doubled. The ore will be crushed at the Best & Belcher mill and the pulp flumed to the plant, which is in Six Mile Canyon. Reduction will begin in January. Heretofore all the ores of Goldfield and Tonopah have been shipped to the smelters in Utah, Colorado and California.

White Pine County.

The Jupiter and Big Dipper claims, near Ely, have been taken over by the Cumberland-Ely Copper Company.

OREGON.

Baker County.

Ore has been cut in the lower tunnel at the Morning mine near Greenhorn. The mill is running steadily. The tunnel cuts the ledge at a depth of nearly 300 ft.——At the Pyx mine they have drifted 100 ft. on the ledge from the bottom of a 60-ft. shaft and they have 4 ft. of ore.——Superintendent Brady of the Belcher mine, near Greenhorn, has resumed work with 15 men. The mine has been shut down since last spring.

At the Imperial mine at Cable Cove, Superintendent Arthur is blocking out ore for the new 75-ton concentrator. The Miner drift is in 1,200 ft. and a crosscut has been started west for the Imperial vein. The Eagle drift is in over 650 feet.

SOUTH DAKOTA.

Lawrence County.

The year of 1905 has been a prosperous one for the Black Hills. The output of gold will amount to about $8,000,000, which is a slight increase over that of last year. There were some unfortunate mishaps during the season, which took off some of the expected increase, such as the fire of the Horseshoe Co., which destroyed the 300-ton cyanide mill, and the failure of the Golden Reward Co. to start up the smelter in Deadwood.——The Homestake Co. averaged a daily production of 4,000 tons, and the gross output may reach $5,000,000. The company is employing 2,500 men.——The Oro Hondo Co. put a shaft down to the depth of 1,200 feet. Some high-grade ore has been found, but it is believed that the shaft was not sunk deep enough to find the Homestake vein.——Southeast of the Ellison hoisting works the Homestake South Extension Co. has put a shaft down 100 ft.——The Wauconda and Anaconda companies, also the Big Lead Co., have done some work.——The Wasp No. 2 Co. has been a steady producer.——The Safe Investment is excavating for a 40-stamp mill.——The Lucky Strike mine has opened up during the year a wide vein. Plans have been drawn for a mill.——In the Bald Mountain district the producers have been the Golden Reward, Horseshoe, Imperial, Dakota, Portland, Clinton and Dividend mines. The Golden Reward Co. is managed by Henry Schnitzel of Lead.——The largest amount of ore in reserve outside the Homestake mine is said to be in the Horseshoe mine.——The Imperial Co. has unwatered the Bertha mine and is taking out 30 tons a day to the Deadwood mill.——Adjoining the Imperial mine are the holdings of the Portland and Clinton Companies. These companies have been shipping from 50 to 70 tons of ore daily to the Lundburg-Dorr mill at Terry.——West of the Homestake belt is the Phonolite district.——The Globe Co. has a shaft 500 ft. deep and 3,000 ft. of underground workings. The company has a mill building completed for a 100-ton cyanide plant, and machinery is soon to be put in. The other companies are planning to do more work this coming year.——At the Union Hill ground, in the Galena district, the Branch Mint Co. has built a railway four miles long, connecting the mine with the mill, has rebuilt the Union hoist, and is building a large cyanide plant, which will be in commission the middle of February. Near the Branch Mint is the Gold Edge-Maid mine, which has been producing for most of the year.

Pennington County.

The Gopher Mining Co. has a free-milling proposition four miles north of Hill City upon which a 10-stamp mill has been built. Work has been in progress also on the Dolcode, J. P. and Fraternity mines. John Truax has interested capital in a wolfram proposition near Hill City, and a hoist and camp buildings are complete.——E. C. Johnson has unwatered the Gertie shaft to the 500-ft. level and a small testing mill is treating the tin-bearing ore.——The Keystone-Holy Terror Co., recently reorganized, is to resume work near Keystone.——The Bullion Mining Co. is excavating for a mill adjoining the Keystone mine, and the Lucky Boy Co. has a shaft which has opened up good ore. This company will build a mill this year.——North of Keystone, four miles, the Eagle Rock Mining Co. has purchased the Wealthy mine and mill.

UTAH.

Beaver County.

At Pine Grove, 25 miles south of Frisco, on the south side of the Wah Wah mountains, the Revenue Mining Co., L. G. Burton of Salt Lake president and general manager, has run 3,000 ft. of tunnel and intends to put in a mill in the spring.——The Wasatch King Mining Co. is working copper claims in the Beaver Lake district, 10 miles northwest of Milford. A tunnel has been run 560 ft.——The Southern Copper Co. in the Beaver Lake district intends to continue its shaft from the 100 to the 500-ft. level. Ed. Wills is superintendent.——The Montreal copper claims, five miles northwest of Milford, are being worked under the direction of J. Forgie.——The Estrella Mining Co. is sinking a 400-ft. shaft on its claims six miles southwest of Milford. S. A. Turbet is superintendent.

Juab County.

The ore shipments from the mines of Tintic for 1905 were the heaviest in the history of the district, amounting to 6,429 carloads. The Centennial-Eureka mine, at Eureka, is the heaviest shipper, with a total of 3,012 carloads. The shipments from the Gemini mine have showed a marked increase, and this mine comes second with an output of 621 carloads. The Eagle & Blue Bell, one of the new mines in the Eureka end of the district, has sent out 415 carloads. The total shipments for the year were:

	Cars.
Ajax	128
Carisa	133
Grand Central	274
Mammoth	419
Gemini (Keystone)	621
Centennial Eureka	3,012
Eagle & Blue Bell	415
Godiva	28
Uncle Sam	136
Yankee	183
Victoria	134
Victor Consolidated	28
Bullion-Beck	262
May Day	88
Tetro	8
Star Consolidated	20
Joe Bowers	1
Eureka Hill leasers	121
Black Jack	11
Dragon Iron mine	66
Bullion-Beck tunnel	10
Lower Mammoth	13
Hopes	1
South Swansea	34
Eureka Hill	4
Argenta	2
Monterey	3
Marlow & Baxter	1
Swansea	168
J. Osborne	1
V. H. Bates lease	1
La Clede	4
Brooklyn Consolidated	11
Kennear & Parker	3
Paxman lease	1
Ridge & Valley	16
Total	6,429

CONCENTRATES.

May Day jigs	6
Uncle Sam mill	43
Total	49

As the railroad cars now in use at the mines average 50 tons each, the output from the mines for the year would amount to 320,900 tons.

Salt Lake County.

The equipment of the United States Mining Co. consists of six copper blast furnaces, and one reverberatory furnace, three lead furnaces, and three more for the same purpose now under construction.

Summit County.

During 1905 Summit county mines produced 84,800 tons of ore and paid dividends of $33,747,000. The following summary of the year's work in the mines of Park City is condensed from the Salt Lake *Tribune:*

Under the superintendency of J. A. McCaskell, the Daly-West has passed through a prosperous year. Nearly 500 men have been employed in the mine and mill. Orebodies are blocked out below the 1,500-ft. level. Sinking the shaft had to be discontinued for the time on account of the closing up of the Ontario drain tunnel. By an agreement with the Ontario company the tunnel will be run under the Daly-West workings and will drain the mine at a depth of about 2,100 ft. The Daly-West shaft will be sunk to this depth. The mill, in charge of F. W. Sherman, has been handling from 10,000 to 15,000 tons of second-class ore per month, and has been running steadily throughout the year. It is operated almost entirely by electric power furnished from the Ontario company's plant. The recently constructed slime plant, operated in connection with the mill, is equipped with Wilfley tables and slimers.——The Silver King is essentially a deep mine, but little ore having been discovered above the 700-ft. level. From this level to the 1,100 has been taken out nearly $25,000,000 worth of ore. From the 1,000 to the 1,300, the bottom level of the shaft, ore has been opened up. The 1,200-ft. level has shipped ore carrying 60% lead, 250 oz. silver and nearly an ounce of gold, with some copper. The mine is under the charge of M. J. Dailey as superintendent and Frank Dailey as foreman. The mill, a 400-ton concentrator, is under the supervision of J. W. Stevens, with J. W. Thompson, Jr., as assistant, and handles the second-class ore from the mine. After nearly two years suspension the management of the Daly-Judge has given orders for the property to commence operations again. John A. Daly is manager. Most of the development work has been done on the 1,200 and 1,500-ft. levels beyond the old workings of the Anchor company. Stoping has been started on the 1,400-ft. level and the ore bins at the mill are full of concentrating ore. The mill is in charge of James T. Kescel and is now being overhauled. Five new Hartz jigs have been added and changes have been made in the arrangement. Contracts have been made for the output of the mine and mill and it is found under the new conditions that the zinc middlings which before were a total loss can now be made to yield a profit.——The Kearns-Keith has been active during the year, employing 75 men in the mine and mill. Its claims are a consolidation of the Crescent, Apex and Ross group, which lay to the

west and adjoin the Silver King. Beneath the track on the Hanauer tunnel level a large body of first-class shipping ore has been blocked out and this ore will be stoped. Prospecting has been carried on in the Apex country. Enough second-class ore has been taken out to keep the mill running. The company may eventually build a large concentrating plant near the mouth of the Alliance tunnel.——Just as the new Ontario mill was ready a fire destroyed the hoist and made an entire close-down necessary. When this was rebuilt the drain tunnel caved, and the mine has been practically idle since April. The mine soon filled with water, so that it is impossible to determine the condition of the underground workings. The shaft is over 2,000 ft. deep, nearly 500 ft. below the tunnel level.——A new surface plant has been built at the American Flag, and much underground development work has been done. The shaft is down 1,100 ft. A new 14x20 double-geared hoist, with 1,200 ft. of cable on each reel, a large compressor, two 60-h. p. boilers and a steel gallows frame were put in place this year.——The Little Bell and West Quincy are operating through the Little Bell shaft. The West Quincy is running a drift from the Little Bell shaft to their own to drain the water.——The Silver King Consolidated is between the Silver King and the old Crescent. It has one of the most complete prospecting plants in the camp. The shaft is down over 800 ft., and drifting is being done on a ledge.——The Comstock has worked throughout the year, and while no ore has been taken out in shipping quantities, the showing is encouraging and the management will continue work. ——The California has done little aside from assessment work.——The Ferry-Hancock, along the line of the Ontario tunnel, has been working all year. New boilers and compressors were installed and a shaft sunk in the tunnel. The mine is in charge of George R. Hancock.——The New York winze has been sunk 200 ft. from the 600-ft. level in ore.——The Naildriver has been practically closed down for the past year, and it is not expected to open before spring.

WASHINGTON.

Okanogan County.

(Special Correspondence).—The Everett Galena Mining Co. has sunk a shaft 90 ft. on the vein. A tunnel is in 370 ft. and tapped the vein 295 ft. deep, going through a foot of talc on the hanging wall and thence 15 ft. into clay and quartz boulders.——The Salmon River Mining & Milling Co. is to resume work soon. A tunnel is in 800 ft.——The third vein of the Triune has been cut in the main tunnel. The ore is free-milling gold.——At the Grand View ore is being stoped on the No. 3 tunnel level, and ore in the bin is awaiting the completion of the aerial tramway. ——A vein of bituminous coal has been discovered, six miles north of Molson. It is of good quality for forging and welding.——At the Rich Bar group a construction cut for the Victoria, Vancouver & Eastern Railway has developed a vein of silver-lead ore, 8 ft. in width to a depth of 25 ft.——The Similkameen Falls Mining Co. will be reorganized under the laws of Washington, to take over claims near the Similkameen falls. The new title will be the Gold Sand Mining Company.

Loomis, Jan. 2.

FOREIGN.

CANADA.

BRITISH COLUMBIA.

Boundary District.

Boundary shipments for the week ending Dec. 30 were: Granby mines to Granby smelter, 16,818 tons; Mother Lode to British Columbia Copper Co.'s smelter, 2,522 tons; Brooklyn to Dominion Copper Co.'s smelter, 1,271 tons; Sunset to Dominion Copper Co.'s smelter, 427 tons; Emma to Nelson smelter, 198 tons; Oro Denoro to Granby smelter, 33 tons; Skylark to Nelson and Granby smelters, 50 tons. Total for week, 21,319 tons; total for year to date, 928,352 tons. Boundary smelters treated as follows: Granby smelter, 14,915 tons; British Columbia Copper Co.'s smelter, 2,628 tons; Dominion Copper Co.'s smelter, 2,114 tons. Total for week, 19,657 tons; total for year to date, 941,817 tons.

A review of the mining and smelting industry for 1905 in the Boundary district shows that it has been a period of steady progress in both the high and low-grade sections. The dividend declared by the directors of the Granby Consolidated on December 1, the amount to be paid on January 15 to shareholders being $405,000, was the largest dividend ever paid by a British Columbia mining company at one time. Another event was the resumption of mining and smelting operations by the Dominion Copper Co., owning claims in Phœnix Camp and a two-furnace smelting works at Boundary Falls. This followed the absorption of the assets of the Montreal & Boston Consolidated, which formerly worked the same mines and smelter. Another event is the announcement of the letting of contracts by the directors of the British Columbia Copper Co. for three new furnaces at their smelter, each of which will be larger than any now in commission in the Boundary. The year 1905 opened with three smelters in full blast in the Boundary and it closed likewise. In the meantime, however, the Boundary Falls plant has been idle for six months, while the company owning it was being reorganized. The British Columbia copper smelter and the company's Mother Lode mine, in Deadwood camp, have been operated continuously during the year, giving employment to 200 men.——At the Granby mines the new No. 3 terminal ore bins and ore crusher were placed in commission, by which the Great Northern Railway receives a part of the tonnage on this property. During the summer orders were placed for a third ore-crusher and for a 250-h. p. electric hoist, to be used at the head-works of the new main shaft that will be sunk on the property. In November the No. 1 ore-crusher building burned down, thus throwing the great bulk of tonnage to the other crusher and over the Great Northern.——The Mother Lode mine has been worked continuously, and a start was recently made to deepen the main shaft of the property from 325 to 500 ft., the diamond drill having proved the existence of ore in the lower levels.——The Dominion Copper Co. is operating the Brooklyn, the Stemwinder, the Rawhide and the Sunset mines, and shipping regularly from all of them. This company intends to erect a modern smelting plant, and in the meantime will use the old plant at Boundary Falls.——In Summit camp, the Emma and the Oro Denoro have been operated most of the year. The former is worked by the British Columbia Copper Co., the ore going to the Nelson and Greenwood smelters. ——The Providence, Skylark, Crescent, Last Chance, Preston, Helen, Elkhorn, Prince Henry, Don Pedro and E. P. U. are high-grade mines that have been worked this year, some of which have shipped ore. The need of a concentrating plant in the district is felt. Still other high-grade mines that have been operated this year are Gold Finch, Gold Bug, Dynamo, Republic, None Such, Bay, Mavis, Silver Cloud, Silver King, Barbara, Maori, Jewel, Twin and Mountain King, and Fremont. Up the West Fork, the Sally and Rambler have been worked and have shipped, with good results, but being as yet 50 or more miles from transportation, shipping is expensive. This, however, is being remedied by the building of the Midway & Vernon Railway, which will afford transportation facilities in another year. At Franklin Camp, 45 miles north of Grand Forks, at the headwaters of the north fork of Kettle river, a number of claims have been located and the McKinley, which was recently bonded to C. R. Hamilton of Rossland for $200,000, has probably had the most work done on it. Other properties in this camp are the I. X. L., the Banner, Homestake, Alpha, Mountain Lion, Gloster, G. H., Tiger, Mineral Hill, Pollard, Ajax, Jumbo, Manhattan and Gold King.

Nelson District.

The Reliance mine, on which a mill on the Hendryx principle has been put in, has been running with an output of 50 tons daily.

Rossland District.

A. J. McMillan is again managing director of Le Roi Mining Co. of Rossland. Cable advices from London announce the resignation of the old board of directors, which had expelled Mr. McMillan from his position, but was repudiated at the recent meeting of Le Roi stockholders in London. Mr. McMillan made his fight on the ground that the company should continue the operation of its smelter at Northport, and should not make an amalgamation with the War Eagle, the Centre Star and the St. Eugene mines, and the Trail smelter. This consolidation was supported by his fellow directors, and when he refused to join with them in the scheme they removed him from the board. Since then John A. Mackenzie has been conducting the affairs of the mine. Under his orders the Northport smelter has been closed. It is expected that Mr. McMillan will immediately start it again, and will send the ore there instead of to Trail under a three-year contract made with that smelter by the anti-McMillan management.

Slocan District.

The total ore shipped by the various mines of the Slocan and East Kootenay districts for the week ending December 30 was 1,471 tons, of which 769 tons were treated at the Hall Mines smelter, 300 by the Marysville and the remainder at Trail. The shippers were the St. Eugene, 624 tons; Sullivan, 300; Ferguson mines, 50; Hunter V., 50; Second Relief, 47; Payne, 43; Eureka, 40; Lone Bachelor, 39; Black Prince, 30; Reco, 30; American Boy, 30; other mines 198. The estimated output for the year in lead is about 29,000 tons. The Trail smelter treated 3,457 tons of ore, the bulk coming from Rossland. The total output of Kootenay and Yale districts for the year is estimated at 1,314,500 tons of all ores.

Vancouver Island.

The Mt. Sicker & Brenton Mines Ltd. is sinking a double-compartment shaft 4 by 8 ft. to a depth of 200 ft., being down 150 ft. on the Copper Canyon claim, near Mt. Sicker. A. Young is superintendent.

MEXICO.

Chihuahua.

Final arrangements have been completed by which F. P. Sherwood takes over the Guadalupe mines, owned by N. S. Benton and associates, near Inde. F. L. Bosqui of San Francisco is visiting the property to determine the best method of treating the ore.

Jalisco.

The Virgin de Guadalupe placer, between Tapalpa and San Gabriel, has been sold to S. Camberos and J. Martinez, both of Jalisco. Kinross & Brown propose to sink 600 shafts to bedrock to determine the amount of pay dirt and the average value. The deposit is 10,000 m. long and 400 m. wide, and comprises 400 pertenencias.

The Independence Mininig & Smelting Co., C. D. O'Brien, Jr., superintendent, has made a six-day trial run with its concentrating plant on copper ores in the Guachinango district. The plant, which is in charge of J. O'Worden of Guadalajara, is to be started up for steady work early in the coming year. Superintendent O'Brien is placing orders for additional machinery.

KOREA.

In the report to the shareholders of the Oriental Consolidated Mining Co. at Puk Chin, it is stated that the operating costs, including all expenditures except those for new construction or development of mines not producing ore, were $2.16½ per ton. They have been aided in arriving at this low figure by the cheap ore obtained from the dumps, and by having expended less than a normal sum upon development work. The latest reports from Korea show a continued lack of labor. This difficulty, combined with the effects of the heavy floods, has prevented the mines and mills from being operated to the normal capacity during the last three months. The company has a large quantity of low-grade ore to be treated. The apparatus for testing the company's placer dredging ground has reached Korea, and while probably the tests are now being made, no report of the results has yet been received. The electric power installation is now in use. The reservoir supply of water, intended to supplement the river supply during the freezing weather, will not be available until next year, owing to the damage done to the dam by the severe flood that washed over it before completed. The report of General Manager H. F. Meserve, covering the operations at the Wunsan district for the year ending June 30, 1905, states 254,821 tons of ore were mined at a cost of $243,807.17, or $0.955 per ton, including cost of all underground development work in these mines during the year. This ore was produced from the Chittabalbie, Tabowie, Taracol, Kuk San Dong and Charabowie mines. During the year there were crushed at the five mills 257,647 tons of ore worth $1,274,106.28. The milling expenses were $244,904.885, or $0.57 per ton. Cordwood made up $0.23 per ton of the $0.57 per ton milling expenses. The milling expenses at the Chittabalbie mill were unusually high, due to considerable necessary repair work. The following table gives information as regards milling operations for the year:

Milling operations for the fiscal year. All figures given in U. S. Gold:

Name of Mill	Number of Stmps.	Tons Ore Crushed	Duty for Stamp 24 hrs.	Value Ore per ton	Value Tailing per ton	Cost of Milling per ton
Chittabalbie...	20	20,314	3.4	$3.845	$0.955	$0.94
Tabowie.....	40	51,389	4.0	5.31	0.71	0.58
Kuk San Dong..	20	25,742	3.8	4.90	0.635	0.57
Malbong	40	58 464	4.2	3.25	0.60	0.46
Taracol.	80	98,708	4.1	5 08	0.93	0 55
	200	257,647	4.0	$4.945	$0.78	$0.57

The combined operations of the Tabowie and Taracol cyanide plants during the year were as follows:

Character of Concentrates	Tons Treated	Value	Percentage Extraction
Tabowie and Taracol mills yield for year....	21,936	$354,708.88	83.2
Tabowie mill, June, 1904.....	130	2,617.22	75.0
Tabowie cyanide dump re-treated.....	4,989	66,371.63	54 3
Taracol cyanide dump re-treated.....	5,501	28,950.77	33.6
	32,556	$452,648.50	75.8

The detailed statement of the average operating expenses of all the mines shows that mining supplies (listed) cost $0.4495 per ton, labor $0.3775 per ton, salaries and board $0.0133, and miscellaneous costs made a total of $0.9568 for mining. Milling costs, including cyanide, were $0.3637 per ton, labor $0.0668, salaries and board $0.1012, other expenses giving a total of $0.5695. The total cost for mining and milling, including amalgamating, concentrating and cyaniding was $1.5263.

Commercial Paragraphs.

THE Midvale Steel Co. of Philadelphia have removed their San Francisco office to 630 Rialto Building.

THE Occidental Machinery & Engineering Co., Inc., of San Francisco has established headquarters and general offices at 401 Mission street corner of Fremont. This company, with Bruce Cornwall president and A. E. Roe vice-president and general manager, was recently organized for the purpose of handling mining and sawmill machinery of every description. Branch offices at Los Angeles, Cal.; Portland, Or.; Seattle and Bellingham, Washington.

AMONG the contracts that F. L. Smidth & Co., cement engineers and makers of cement machinery, 41 Cortlandt street, New York, have recently taken is one for 17 of their large size tube-mills for the Pacific Portland Cement Co., Cement, California, and another one for 24 kominuters and tube-mills for the new plant at Fogelsville, Lehigh Co., Pa., of the Lehigh Portland Cement Co. Three additional kominuters are being installed at the Mill 'D' of the Lehigh Company.

ON the page opposite the first reading matter in this issue appears the advertisement of Fair-Williams Bridge & Mfg. Co., of Ottumwa, Ia. This company has been in the bridge business under a different management for a good many years, but has lately been acquired by the managers of the Ottumwa Box Car Loader Co., and the two plants are now consolidated, all the manufacturing business being done under one roof of a very thoroughly equipped and arranged manufacturing plant. They manufacture box car loaders for loading any material in box cars where a large tonnage is needed to be handled, also mine car wheels, mine cars complete, cages, sheaves, steel bridges, coal mine tipples, steel head frames, and anything in the line of structural iron work for mining purposes, and the erection of buildings.

Trade Treatises.

Circular No. 1,107 from Westinghouse Electric & Manufacturing Co. of Pittsburg, Pa., describes Westinghouse automatic circuit breakers with carbon break for direct and alternating currents. Folder No. 4,051 pictures and describes pipe-thawing apparatus.

'Machinery and Equipment for the Smelting of Ores, Catalogue 105 of the Fulton Iron Works, 15-17 First street, San Francisco, Cal., presents engravings and explanations of furnaces, converters and accessories for copper and lead smelting. The pictures are good and the notes on smelting will be of interest to anyone engaged in smelting. The neat appearance of the catalogue gives a favorable impression of the company's product.

Dividends.

January 2 the Bunker Hill & Sullivan Mining & Concentrating Co. declared dividend No. 100 of $180,000, payable on the 4th inst. This makes the total paid since Jan. 1, 1905, $3,435,000, and total to date $5,706,000.

Personal.

H. HIBBERT is in Siberia.

CHAS. A. MOLSON is in New York.

GEORGE A. SCHROTER is at Pachuca, Mexico.

T. MERWYN-SMITH is examining mines in Ashanti.

W. H. BASHAM of Placerville is visiting San Francisco.

M. M. O'SHAUGHNESSY is visiting San Francisco from Hawaii.

H. H. NICHOLSON is examining mines at Guanajuato, Mexico.

E. A. MONTGOMERY of Bullfrog, Nevada, is at the St. Francis.

H. C. HOOVER has returned to London from Western Australia.

H. E. ARROWSMITH is with the Tennessee Copper Company.

W. E. DEFTY will be engaged in Sonora, Mexico, during January.

CHARLES JANIN has returned from western Chihuahua, Mexico.

F. H. MINARD is examining mines at Gabriel, in Durango, Mexico.

D. F. CAMPBELL has joined the staff of the Mountain Copper Company.

GEORGE J. HOFFMANN has left London on his return to Johannesburg.

A. H. BROMLY is in San Francisco, on his way from Alaska to London.

ROSS E. BROWNE is in London and will remain there for several months.

A. B. WALLACE, lately at Menzies, Western Australia, is in San Francisco.

WILLIAM A. AKERS has changed his residence from El Paso to Los Angeles.

GEORGE KISLINGBURY is examining copper mines in Kern county, California.

LOUIS NOBLE has been appointed geologist for the Great Northern Railroad.

LOUIS WEBB, lately of South Africa, has settled at Cambridge, Massachusetts.

P. B. MCCOY of New York has gone to Central America on mining business.

HENRY F. LEFEVRE was married to Miss Alice Rooks at New York on December 14.

JAS. W. MALCOLMSON is examining the San Gregorio mine at Guanajuato, Mexico.

BEN S. REVETT sailed from New York on his way to Cali, in Colombia, on December 17.

MARK R. LAMB is mill superintendent for Combination Mines Co. at Goldfield, Nevada.

FORBES RICKARD has returned to Denver from examining mines at Silverton, Colorado.

ERNEST A. WEINBERG returned from San Francisco to Sydney by the *Ventura* on January 4.

W. E. THORNE, manager the Snow Storm Hydraulic Co., Alma, Colorado, is in San Francisco.

GEORGE H. EVANS has changed his residence from Breckenridge, Colorado, to San Francisco.

GEORGE R. STEVENS sailed on December 30 from San Francisco to proceed to Wei-hai-wei, China.

C. A. HEBERLEIN is now with the American Smelting & Refining Co. at Aguascalientes, Mexico.

FRANCIS B. VOYLE has resigned as superintendent of the Oakland mine in Sierra county, California.

A. H. RICHARDS has been made head chemist American Smelting & Refining Co. at Salt Lake City.

C. W. WHITLEY is general manager for the American Smelting & Refining Co. at Salt Lake City.

R. H. ANDERSON has succeeded James Finlay as manager Sullivan mines at Kimberley, British Columbia.

C. W. PURINGTON, who has been examining mining property in Cook Inlet, Alaska, has returned to Denver.

JAMES FINLAY has resigned as manager Sullivan mines at Kimberley, B. C., and will visit Paisley, Scotland.

THEO. F. VAN WAGENEN, of Denver, is engaged in examining mines in northern Mexico, with temporary address at El Paso.

HENRY S. PRICHETT has resigned as president Massachusetts Institute of Technology, to take the presidency of the Carnegie Foundation for pensioning professors.

JOHN J. DALY, general manager of the Daly-Judge mine, Utah, and MALCOLM MCDONALD, superintendent of mines at Tonopah, are at the Palace Hotel; J. J. COLEMAN, of Bisbee, is at the Lick House.

Obituary.

JOSEPH D. NEWMAN, a well-known mining man and superintendent Durand mine, died from typhoid pneumonia, at Aspen, Colo., Dec. 28, aged 48 years.

METALS.

SILVER.—Per oz., Troy: London, 30d (standard ounce, 925 fine); New York, bar silver, 64⅜c, refined (1000 fine); San Francisco, 64¼c; Mexican dollars, 50½c, San Francisco; 50c, New York.

COPPER.—(By Wire)—New York: Lake, 18½@19c; Electrolytic, 18⅜@18¾c; Casting, 18⅛@18⅜c per pound. Mill copper plates, $21.00; bars, 21@24c. London: £80 2s 6d spot per ton.

LEAD.—New York, $5.60; St. Louis, $5.90; San Francisco, $5.15, carload lots; 5¼c 1000 to 4000 lbs.; pipe 7½@8⅜c; sheet, 8¾@8¾c; bar 6¾c. London: £17 10s ℔ long ton.

SPELTER.—New York, $6.60; St. Louis, $6.45; London, £29 7s 6d ℔ ton; San Francisco, ton lots, 7c; 100-lb lots, 7¾c.

TIN.—New York, pig, $35.95@36.15; San Francisco, ton lots, 38c; 500 lbs., 39c; 200 lbs., 40c; less, 41½c; bar tin, ℔ lb., 40c. London, £163.

PLATINUM.—San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $20.50 ℔ Troy oz. Platinum ware, 75@$1.00 ℔ gram.

QUICKSILVER.—New York, $40.00@$40.50, large lots; London, £7 5s 0d; San Francisco, local, $38.00@39.00 ℔ flask of 75 lbs.

BABBITT METAL.—San Francisco, No. 1, 10½c; No. 2, 8c; No. 3, 7½c; extra, 17½c; genuine, 32½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 23.50c; San Francisco, Plumbers', 100-lb. lots 19.75c.

NICKEL.—New York, 55@60c ℔ lb.; ton lots, 40@47c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb, .04c.

ALUMINUM.—No. 1, 99%, small lots, 37c ℔ lb.; 100 lbs.. 35c; 1000 lbs. 34c; ton lots and over, 33c, Pittsburg. No, 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $18.35@18.85; gray forge, $14.60; San Francisco, bar, 3½c ℔ lb., 3¾c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $26.00@$27.00; open hearth billets, $27.00@$28.00; San Francisco, bar, 7c to 13c ℔ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 7¼c; less than 500 lbs., per lb., 8c; in 25-lb. tin pails, ½c ℔ lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, ½c per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 7½c; do. in kegs, 8c.

LIME.—Santa Cruz, $1.35 country, $1.25 city ℔ bbl.

CEMENT.—Imported, $3.00@4.00 ℔ bbl.; California, carload lots, $1.80 f. o. b. at works; small lots, $2.10 ℔ bbl. in sacks, 4 sacks to bbl., 5c for each sack returned.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00;shingles, $2.50 for No. 1, and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d, Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4d and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 11½c; Hallett's, 12½c; San Francisco, 1000-lb. lots, 14c; 300@500-lbs. 12c; 100-lb. lots, 13c.

BONE ASH.—Extra No. 1, 5@6c ℔ lb; No. 1, 4@5c.

BORAX.—Concentrated, 7@8c ℔ lb; powdered, 9@10c; fused, 25@30c; crystal, 7c.

CANDLES.—Spear Brand, 16 oz. adamantine, 40s., 11c ℔ set; 14 oz. adamantine, 40s., 10c; 12 oz. adamantine, 40s, 9c; 10 oz. adamantine, 40s, 8c; 16 oz. stearic, 40s, 12¾c ℔ set; 14 oz. stearic, 40s, 11½; 12 oz. stearic, 40s, 10½c; 10 oz. stearic, 40s, 9½c. 100-case lots and over, ½c less. Not less than 50-case lots, ¼c less. Boxes of 20s, price ½c advance.

CAPS.—3x, $5.50@6 per 1000; 4x, $6.50@7; 5x, $8@8.50; Lion, $9@9.50, in lots not less than 1000.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3½c ℔ lb.; caustic soda, in drums, 3@3½c ℔ lb.; Cal. s. soda, bbls., $1.10@1.20 ℔ 100 lbs.; sks., 90c@$1.00; chlorate of potash, 12@13c; nitrate of potash, 6¾@7c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2½@2½c; flour sulphur, French, 2¾@—c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 5¼@5½c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66° B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

OILS.—Linseed, boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 57c; Lucol oil, boiled, bbl., 48c; cs., 53c; raw-bbl., 46c; cs., 51c. Kerosene—Pearl, per gal., 17½c; Astral, 17½c; Star, 17½c; Extra Star, 20½c; Eocene, 19½c; Elaine, 26c; Water White, in bulk, 11c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 14½c, do., cs., 21c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 12½c; do., in cs., 19c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 68c; Bleached, do., 68@73c; Whale Oil, cs., 52@67c.

BISMUTH.—Subnitrate, ℔ lb., $2.10.

CHROMIUM.—90% and over, ℔ lb., 80c.

FIRE BRICK.—Domestic, carloads ℔ 1000, f. o. b., factory square, $25.00; soap and split, $22.50; arch and wedge, $27.50; skewback, $30.00; circle, $32.00.

FIRE CLAY.—Domestic, ℔ ton 2000 lbs. in 125-lb. bags double, and dry ground, f. o. b., factory, $8.50.

FUSE.—Triple tape, $4.00 per 1000 feet; double tape, $3.55; single tape, $3.10; Hemp, $2.85; Cement No. 2, $3.10; Cement No. 1, $2.75, in lots of 3000 and up.

LITHARGE.—Pure, in 25-lb. bags, 9½@10½c ℔ lb.

MAGNESIUM.—Pure, N. Y., $1.60.

MANGANESE.—Black oxide, ℔ lb., 2¾@4c.

MERCURY.—Bichloride, ℔ lb., 77c.

MOLYBDENUM.—Best, $2.75 ℔ lb.

PHOSPHORUS.—American, ℔ lb., 70c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitroglycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1**, 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2**, 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

RED LEAD.—500 lbs. and over at one purchase, ℔ lb. 7½c; less than 500 lbs., 7¾c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 54c

SODIUM.—Metal, ℔ lb., $1.

TUNGSTEN.—Best, ℔ lb., $1.20.

URANIUM.—Oxide, ℔ lb., $3.40.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market street, San Francisco, has official reports of the following United States patents issued to Pacific Coast inventors:

FOR THE WEEK ENDED DECEMBER 19, 1905.

807,988.—INKING PAD—J. F. Ames, Portland, Or.
807,707.—ELECTRIC SIGNAL—Ammann & Campbell, Spokane, Wash.
807,708.—RECORDING APPLIANCE—Ammann & Campbell, Spokane, Wash.
807,800.—ELECTRIC SIGNAL—Ammann & Campbell, Spokane, Wash.
807,898.—POTATO PLANTER—W. E. Bakeman, Snohomish, Wash.
807,534.—COMBINATION TOOL—J. S. Barnes, San Francisco.
807,994.—PUMP—O. R. Beck, Quilcene, Wash.
807,592.—PORTABLE FENCE—J. Becker, Mount Olivet, Cal.
807,431.—ELECTRIC RAILWAY—W. J. Bell, Los Angeles, Cal.
808,006.—ROTARY BRUSH—C. H. Butler, Oakland, Cal.
808,040.—RAIL JOINT—J. S. Goodwin, Centralia, Wash.
808,044.—CAN EXHAUSTER—M. W. Groom, San Jose, Cal.
807,461.—CAR FENDER—E. C. Haynes, Portland, Or.
807,558.—FILTER—E. C. Jaeger, Santa Paula, Cal.
807,940.—HEADLIGHT—M. Johnson, Drain, Or.
807,471.—STACKER—F. A. Kinne, Westfall, Or.
807,621.—CURTAIN FIXTURE—G. W. Kautz, Santa Monica, Cal.
807,750.—BED PROTECTOR—M. B Le Lande, San Francisco.
807,950.—GAS ENGINE—Longtine & Double, Los Angeles, Cal.
807,835.—OIL ENGINE—D. W. Lyon, Sutter Creek, Cal.
807,840.—HOLDER—Martin, Toledo & Kennard, Fernhill, Wash.
807,841.—VAPOR BURNER—J. A. Mather, San Diego, Cal.
807,483.—FISH SCREEN—F. B. Morse, Walla Walla, Wash.
807,969.—ANIMAL TRAP—S. H. Shelley, San Jose, Cal.
807,642.—SOLAR HEATER—Sides & Klensch, Covina, Cal.
807,643.—NAIL PULLER—G. E. Sly, San Diego, Cal.
807,972.—PASTE PRESS—C. R. Splivalo, San Francisco.
807,978.—GRAIN SEPARATOR—J. S. Walch, Roselawn, Cal.
807,521.—ICE CUTTER—F. Walker, Los Angeles, Cal.
37,737.—DESIGN—F. J. Rosenberg, Los Angeles, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS United States and Foreign Patent Agency, the following are worthy of special mention:

PIPE PERFORATORS.—No. 808,235. December 26, 1905. Edwin R. Graham, Coalinga, Cal. This invention relates to devices for perforating oil and artesian well casings for the purpose of admitting the percolating liquids into the casing to be removed therefrom subsequently by the pumps. Its object is to provide a simple, practical machine for quickly perforating the casing, and comprises an apparatus by which a series of holes may be rolled in a casing instead of having to punch each hole separately and which separate punching necessitates the intermittent moving and stopping of the machine for each hole. It consists in the combination of a head, a star-wheel having its axle supported in inclined slots in said head, toggle-levers connected with said wheel, a rod operable on said levers to actuate the wheel and means to reciprocate the head, and in other details of construction.

BED-BOTTOMS.—No. 808,369. December 26, 1905. John Hoey, San Francisco, Cal. This invention relates to improvements in flexible elastic fabric for bottoms for beds, couches, and like structures. Its object is to provide a flexible elastic support for the bedding or superstructure of couches, beds, sofas, and the like, in which is provided a longitudinal elasticity of the structure and a transverse bracing of the parts to prevent the sides of the elastic structure from being unduly drawn inward when the weight is upon it and to prevent the independent parts composing the structure from getting out of alinement. It comprises a series of parallel interlocked yokes and spiral springs with which the terminal ends are connected, said yokes having their open ends bent to form supplemental curves, and straight transverse extensions with hooks upon the outer ends by which the parallel series may be united into a continuous flexible structure.

PASTE PRESS.—No. 807,972. December 19, 1905. C. R. Splivalo San Francisco, Cal. This invention relates to improvements in presses used in the preparation of macaroni and like paste products. It consists in the combination with a paste press having a die member, of a normally retracted knife operable across the path of the product issuing from said die member, a movable receiver or holder for the product of said die member, and means operable by said receiver to actuate the knife to sever said product. There are other details of construction combined and arranged to form a useful device which produces a more uniform and superior product than can be obtained under ordinary methods. The press has also a considerably increased capacity, and a great saving of time and labor is effected by the die arrangement and the spreading and cutting mechanism.

ROTARY BRUSH FOR STREET SWEEPER AND THE LIKE.—No. 808,006. December 19, 1905. C. H. Butler, Oakland, Cal. This invention relates to an improved rotary brush for street sweeping machines and the like. It consists in combination with a suitable radially adjusted support, of a bunch of bristles, and a bristle-support comprising a pair of relatively reversed, U-shaped clips, one of said clips having its arms slotted and the other clip having its arms fitted within the slots of the first named clip, said clips having registering perforations and provided with means for forcing the clips together to grip the bristles.

PUMPS

Jackson's Mine Sinking Series Turbine Pump,

Direct Connected to Westinghouse Motor.

THIS PUMP has many advantages over the steam pump, as it does away with all valves, stuffing glands, steam and exhaust pipe, etc., there being no pipe to adjust its length but the discharge pipe. The electric wires which take the place of steam pipes are made long enough to cover any desired range of sinking without renewal.

THIS PUMP can be operated against any head, and can be designed for any quantity ranging from 100 gallons per minute upwards. The quantity to be pumped can be instantly and perfectly regulated by the discharge valve.

ASSESSMENT NOTICE.

ALTA SIERRA GOLD MINING COMPANY.—Location of principal place of business, Room 620, Kohl Building, 406 Montgomery street, San Francisco, California; location of works, Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of December, 1905, an assessment (No. 3) of twenty (20) cents per share was levied upon all the issued capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 620, Kohl Building, 406 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Wednesday, the 31st day of January, 1906, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 28th day of February, 1906, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM. W. CHEYNEY, Secretary.
Office—Room 620, Kohl Building, 406 Montgomery street, San Francisco, California.

SITUATIONS WANTED.

☞ *The cost of advertising in this column is 10 cents per line of seven words per insertion. Answers forwarded to any address without extra charge.*

ASSAYER AND CHEMIST WANTS POSITION. Ten years' experience; cyanide smelting. Address F, this office.

COMPETENT ASSAYER, FAMILIAR WITH concentration and amalgamation, and with underground experience, desires position Address A. R., this office.

EXPERIENCED MILL FOREMAN SEEKS POsition. Battery man, concentrator man, cyaniding and assaying. References exchanged. Address P. O. Box B, DeLamar, Idaho.

MANAGEMENT OF GOLD, SILVER, OR COPper property wanted by American engineer now in same work. At liberty January, 1906. Present position worth £1500 per annum. Age 34; married. Practical experience—12 years of underground, milling, cyaniding, civil engineering, and office work. Address M. A. W., P. O. Box 67, Oak Park, Illinois.

MINING ENGINEER, 28, GRADUATED 1904 desires position in Southwest. Now on engineering staff of large open pit and underground iron mine using caving system. Does surface and underground surveying and general engineering work. Prefers company operating mill or smelter Address Box 49, this office.

POSITION WANTED BY PRACTICAL MINE and mill Supt.; 25 years experience in California and Nevada. References furnished. Address K J. J., this office.

POSITION DESIRED BY MILLMAN FAMILiar with amalgamation and concentration. References furnished. Address Box 48, this office.

PRACTICAL AND ECONOMICAL MINE AND mill superintendent. Thirty years' experience. Have been quite successful in handling low-grade ores. Can give references from first-class companies. Address M. & M., Mining and Scientific Press.

PRACTICAL METALLURGIST WILL BE open for engagement after Jan'y 1st. Has thorough knowledge of hypolixiviation and treatment of acid tailings by cyanide Speaks Spanish and can furnish best of references. Over three years in Mexico with same employers. Address F. K. L., care of Mining and Scientific Press.

WANTED—POSITION AS SUPT. OR FOREman, or will fill place of both; 35 years experience; familiar with mining of all classes, timbering, machinery, etc. Best of references. T.E.W., this office.

WITH MINING COMPANY TO LOCATE GOLD Dredging, Placer or Copper Property. Address F., this office.

HELP WANTED.

IN OUR BUSINESS OF BRINGING CAPABLE men in contact with Western employers we specialize in mining, engineering and technical positions. We place superintendents of mines, mills, cyanide plants, samplers and smelters, also assayers, chemists, surveyors, draftsmen, electricians, and other technical men. Call or write for our new booklet explaining our methods and terms. Business-Men's Clearing House, 505-506 Century Bdg., 17th and Stout Sts., Denver, Colorado.

WANTED—A FIRST-CLASS SURVEYOR AND draftsman for mine surveying, maps and mechanical drafting. Must be neat, accurate; a hustler and not afraid of other work. State experience and pay wanted. Address "Canada," this office.

Standard Books

—ON—

Mining, Metallurgy, Geology, Chemistry, Surveying, Engineering, Etc., of Technical Value to Practical Men.

Any of these books will be mailed postpaid on receipt of price to any address. Remit by draft, check or money order to

MINING AND SCIENTIFIC PRESS,

MACHINERY FOR SALE.

MACHINERY FOR SALE
AT THORNTON, N. M.

The most complete plant of high class machinery ever erected, for sale at 25 to 50 per cent of its original cost, either as a whole or in any part. Write us for complete list and specifications.

STRUCTURAL STEEL BUILDINGS.
Compressor and Shaft House, 68x45 ft.
Crusher Building, 88x75 ft.
No. 1 Leaching Building, 175x57 ft.
No. 2 Leaching Building, 113x68 ft.

2—150 H. P. Heine Water-Tube Boilers.
1—30 H. P. Locomotive Type Boiler.
1—300 H. P. Feed-Water Heater.
1—100 H. P. Scoville Link-Motion Hoist.
12x19x16 Rand Compound Belted Compressor.
16x16½x18 Ingersoll-Sergeant Compressor.
12—3⅛-inch Rand Little Giant Drills.
2 sets 14x27 Allis Belted Rolls.
4 sets 16x36 Davis Belted Rolls.
1—9x15 Blake Crusher.
1—4x6 Dodge Crusher.
3—5-ft. Huntington Mills.
2 Revolving Ore Dryers.
9 Automatic Ore Feeders
8 Hexagonal Screens, 3½x8 ft.
4 Gould Triplex Solution Pumps.
12 Steel Tanks, 25 ft. x 6½ ft.
8 Steel Tanks, 25x30 ft. x 6 ft. 10 in.
5—30-ton Storage Tanks.
5—38-ton Sump Tanks.

Write for a complete list of this plant and specifications of any of the machinery.

THE S. H. SUPPLY CO., 1803 Lawrence St. DENVER, COLO.

TO THE PUBLIC.

We take occasion in this publication to thank our many friends and patrons, for favors extended to us in the past year, and assure you that it shall be our aim in the future, as it has in the past, to give to the machinery buying public the best values, best service, and best terms possible.

We solicit, for this coming year, your patronage, and assure you same will be well guarded.

With compliments of the season, we are,

Yours very truly,

THE GREAT WESTERN MACHINERY CO.

1624 Blake St., Denver, Colorado.

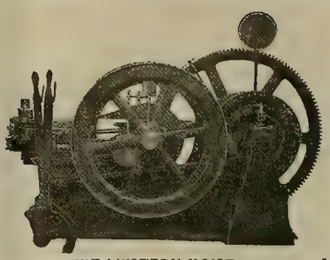
THE WESTERN GAS ENGINE.



THE WESTERN HOIST.
Lightest weight for its power; 50 per cent of speed controlled by foot lever; brake and clutch very sensitive and powerful; levers at end with everything straight ahead of operator; highly finished throughout.

"FROM FACTORY DIRECT TO USER."
Designed and built by Western experts, for Western use with Western fuel. The strongest, simplest and most successful engine on the market to-day.

BURNS CHEAPEST FUEL AND USES LEAST.
Burns gasoline, distillate or crude oil, and requires from 20 to 40 per cent less than any other make. Better, cheaper and more convenient than steam.

OUR ILLUSTRATED CATALOGUE
Fully describes every detail in construction of Western Engines. It tells how and why they lead all other makes—it gives the facts, the proof. Your name will bring it—free Ask for latest catalogue A-9.

CYANIDE TANK

Corrugated Tanks

For Cyanide Purposes.

MANUFACTURERS OF
TANKS
OF EVERY DESCRIPTION.
AIR PIPE,
CORRUGATED ROOFING,
FIREPROOF CEILINGS.

For cyanide purposes the corrugated tanks are much superior to plain tanks, for two reasons:

1. The corrugations act as baffles and throw the solution into the sand, thereby assisting the cyanide in percolating the ores instead of running up and down the sides, as is the case with plain tanks.

2. A corrugated tank has in it 10% more material and being arched three ways makes it 6¾ times stronger than ordinary tanks.

J. F. HOLBROOK COMPANY,

310-14 and 311-15 East Market St. (formerly Requena St.) LOS ANGELES, CAL.

71 Broadway, New York.
Cable: *Ikona.* Code: Bedford McNeill.

Assayers, Chemists and Ore Testing Works.

ADDITON, A. SYDNEY,
CYANIDE CHEMIST & CONSULTING ENGINEER
301 Market St., San Francisco.
Plants Designed and Installed. Reports Made.

BARNHART, A. D.,
ASSAYER AND METALLURGIST.
Prescott, Arizona.

BAVERSTOCK & STAPLES,
ASSAYERS AND METALLURGISTS.
Testing Works, 322 West First St., Los Angeles.
Specialty: Molybdenite. No students engaged.

BURTON, HOWARD E.,
ASSAYER AND CHEMIST.
111 E. Fourth St., Leadville, Colorado.
Specimen Prices: Gold, 50c; Gold and Silver, 75c; Gold, Silver and Lead, $1; Gold, Silver and Copper, $1.50; Silver or Lead, 35c; Copper or Zinc, $1. Mailing Envelopes sent to any address. Cyanide tests. Reference: Carbonate Nat. Bk.

BURLINGAME & CO., E. E.,
ASSAY OFFICE AND CHEMICAL LABORATORY.
1736-1738 Lawrence St., Denver, Colorado.
Established in Colorado 1866.
Samples by mail or express will receive prompt and careful attention.
Gold and silver bullion refined, melted and assayed, or purchased.
Concentration tests—100 pounds or carload lots. Write for terms.

CURRIE, J. W.,
ASSAYER.
W. Third South St, Salt Lake City.

DENVER ANALYTICAL & ASSAYING CO.
J. N. McLeod, Manager.
1747 Lawrence St., Denver, Colorado.
Gold, Silver or Lead, 50c.
Gold and Silver, 75c.
Gold, Silver and Lead, $1.
Send for Complete Price List and mailing envelopes.

ELECTRIC BLUE PRINT CO,
BLUE PRINTS AND SUPPLIES.
157 New Montgomery St., S. F. Phone Red 521.
Rapid Blue Printing. Tracings made. Blue Print Paper and Draughtsman's Supplies.

FALKENAU ASSAYING CO., INC.
STATE ASSAY OFFICE.
538 Sacramento St., below Montgomery.
San Francisco.
Analysis of ores, metals soils, waters, industrial products, foods, medicines, etc., etc. Court experting in all branches of chemical technology. Working tests on ores and investigation of metallurgical and manufacturing processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

HANKS, ABBOT A.,
CHEMIST AND ASSAYER.
Successor to Henry G. Hanks, established 1866.
529 California St., San Francisco.
The supervision of sampling of ores shipped to S. F. a specialty.

HERSEY, CLARENCE,
ASSAYER AND CHEMIST.
(Established 1879.) Leadville, Colorado.
Gold, Silver and Lead, $1.00.
Any two of above, 75c; any one of above, 50c. Copper analysis, $1.00; Platinum, Nickel or Tin, each $5.00. Twenty-four years' successful experience in the mining metropolis of Colorado. Write for mailing envelopes and price list.

HUNT, BERTRAM,
CONSULTING CHEMIST.
604 Montgomery St., San Francisco.
Fellow of the Institute of Chemistry. Specialty: Treat. of Gold, Copper and Refrac. Ores.

IRVING & CO., JAMES,
GOLD REFINERS AND ASSAYERS.
128 N. Main St., Los Angeles, California.
Cash for Bullion. Mines Examined.

WELD, STANLEY B.,
ASSAYER AND CHEMIST.
126 West First St., Salida, Colorado, Box Z.
Guaranteed Assays.
Specimen Assays: Gold, Silver, Lead, $1; any two, 75c; copper, 75c. Low prices for chemical work. Write for prices, discounts and sample sacks. I am not running an Assay Co. but personally conduct and guarantee all work. Formerly doing Umpire work in Denver. Highest of references in East and West. Control and Umpire work. Mail orders receive prompt attention. W. U. Telegraph Code.

MINERS' ASSAY OFFICE,
(JOHN HARRIGAN)
25 Stevenson St., San Francisco.
Telephone: Clay 972.
Assaying, Analyses, Sampling, Grinding and Pulverizing of all kinds. Practical Working Tests of Ore by all Processes. Mining Machinery Bought and Sold. Check Assays. Instructions given in Assaying. All Work Guaranteed.
Mines Examined, Sampled and Reported on by J. J. Cummings, Mining Engineer and Cyanide Expert.

OGDEN ASSAY CO.,
1540 Court Place, opposite Court House,
Denver, Colorado.
Reliable Assays—Gold, 75c; Lead, 75c; Gold and Silver, $1; Gold, Silver, Copper, $1.50.
Samples by mail receive prompt attention. Placer gold, retorts and rich ores bought. Send for free mailing envelopes and price list.

PEREZ, RICHARD A., E. M.,
ASSAYER AND ANALYTICAL CHEMIST.
120 N. Main St., Los Angeles, California.

RICHARDS, J. W.,
ASSAYER AND CHEMIST.
1732 Champa St., Denver.
Ore Shippers' Agent. Write for Terms.

SIMONDS & KING,
(Lochiel M. King, Ernest H. Simonds),
METALLURGICAL ENGINEERS AND CHEMISTS.
417 Montgomery St., San Francisco.
Telephone: Black 4455.
Mill Examinations.
Methods of Treatment Devised.
Complete Ore Tests.
General Assaying and Analyses.

SMITH, EMERY & CO.,

BUREAU INSPECTIONS AND TESTS.
83-85 New Montgomery St., San Francisco, California.
Physical Tests, Inspections.
Chem. Analysis—Metals, Fuel, Water.

THE DENVER LABORATORIES,
(H. C. Parmelee, R. Gahl, Ph.D., C. H. Bryan).
ASSAYERS, ANALYSTS, ELECTROCHEMISTS.
1755 Arapahoe St., Denver. Associated with James Underhill, M. E., Idaho Springs.

THE DENVER ORE TESTING & SAMPLING CO.
Office: 527 17th St. Works: Corner Bryant and West Sixteenth Ave., Denver.
N. C. Bonnevie, General Manager. C. A. Hoyt, Chemist and Metallurgist. Ore tested in carload lots or smaller quantities by any modern metallurgical process. Best equipped plant in the world. Write for booklet.

WADE & WADE,
ANALYTICAL CHEMISTS AND ASSAYERS.
318 East First St., Los Angeles, California.

WHITE, H. W.,
ASSAYING.
751 Market St., San Francisco.
Telephone: Montgomery 1383.

WOOD & CO., HENRY E.,
ASSAYERS.
1734 Arapahoe St., Denver, Colorado.
Ores tested in carload lots. Amalgamation, concentration, cyanide, Wetherill magnetic separator, Blake electric separator. Send for circular.

CALIFORNIA ORE TESTING WORKS. Abbot A. Hanks. Francis L. Bosqui.
COMPLETE MILLING TESTS ON ORES.
Office, 559 California St.; Works, 364 Bay St., San Francisco, California.
Cyaniding a Specialty.
Send for Booklet.

LUCKHARDT CO., C. A., A. H. Ward.
NEVADA METALLURGICAL WORKS.
71 and 73 Stevenson Street., San Francisco, California.
Established 1869.
Telephone, Main 5104. Cable *Luckward.*
Assaying, Analyses, Sampling.
Practical Working Tests of Ore by all Processes.
Stamp Mill and Concentrator in Operation on Premises.

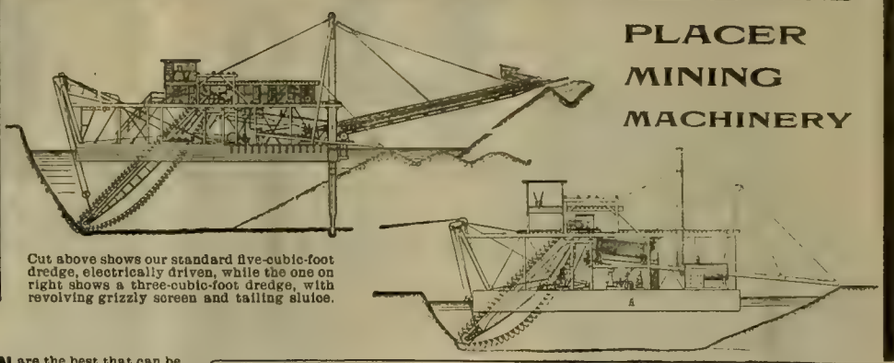
THERE is no unsupported "theory" in our advertising columns. What there appears has cost millions in experiments; has been proved to be efficient and represents the most advanced state of the art.

GOLD DREDGES AND PLACER MINING MACHINERY

Five-cubic-foot dredge, "El Oro No. 1," El Oro Dredging Co., Oroville, Cal.



Cut above shows our standard five-cubic-foot dredge, electrically driven, while the one on right shows a three-cubic-foot dredge, with revolving grizzly screen and tailing sluice.

OUR DREDGES IN DESIGN AND CONSTRUCTION are the best that can be built. They possess the highest efficiency and insure a minimum loss of time through delays for repairs or renewals.

We will estimate on complete dredges of the bucket type or on all or any portion of the machinery.

P & B

READY ROOFING.

If it were possible to make a better roofing in the one or more points that go to make a good ready roofing, we would certainly make P & B Ready Roofing better.

Is it not reasonable to presume that if it were possible to make P & B Ready Roofing better, we would have done so during the 21 years we have made and sold this excellent roofing material?

We are continually in touch with every phase of roofing—the requirements, the materials, facilities, etc., so we know the roofing business and we make the very best roofing that science, facility and money can put together, and we call that roofing P & B Ready Roofing.

FIRE—P & B Ready Roofing will resist fire—firebrands and coals will not ignite it. Insurance companies class it with roofs of tin and iron. We have many letters endorsing its fire-resisting qualities.

WATER—Water cannot injure it—cannot get through it—and it cannot rot it. P & B Ready Roofing is absolutely water proof.

GASES--FUMES—While gases and fumes, heat and cold, rot, decay and deteriorate tin, iron, shingles, slate and tar, it has no effect whatever on P & B Ready Roofing. We have never heard of fumes, gases or smelter smoke causing the slightest injury to P & B Ready Roofing.

SUN HEAT has not the slightest effect on it—won't expand, crack or melt it, or cause an odor to arise. Furthermore, P & B Ready Roofing is a non-conductor and no matter how hot the sun shines down on your building, heat cannot get through P & B Ready Roofing, and it won't impart heat, so your building is cooler in summer and warmer in winter. Cold weather does not make any difference either.

SNOW won't remain on a sloping roof covered with P & B Ready Roofing or go through a flat roof made of it. Up in Dawson and Cape Nome we have sold thousands of rolls, because it will stand the climate with wonderful endurance.

ACIDS—We know of no acids that are likely to affect it while on the roof. Acids compounded by smoke, fumes, and rain water won't hurt it one bit.

CONVENIENCE—P & B Ready Roofing is certainly convenient, if it is anything. It is about ⅛ of an inch thick and 32 inches wide and put up in rolls containing enough roofing to cover 200 square feet. The weight per roll is from 90 to 120 pounds, according to grade. It is compact, does not weigh very much—is not bulky or hard to carry. You can take it in your trunk if necessary, or you can put it on horseback or in a light buggy, and that is something you cannot do with tar, slate, iron, tin or shingles.

AND AGAIN—It don't cost much to ship it—the freight rate is very low.

But last, and above all, is its durability, strength and quality—once it is on your building that is the end of your troubles.

Rain may pour; snow may come and wind may howl; heat can boil and gases annoy, but your roofing is proof against them all and your building protected. Your mind may rest free and easy, for you will not have any roofing troubles to bother or roofing expenses to pay.

We are always glad to give further information—write for it.

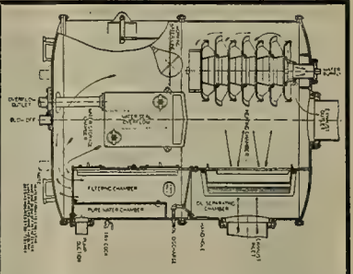
SEATTLE, WASH.



How the

Stilwell Heater

Heats and Purifies the Feed Water.

The exhaust steam from the engine enters the oil separator on the upper right-hand side of the heater. The oil separator is one of the vital parts of an open heater and is a subject upon which we would like to give you a few points before you purchase a heater. Oil should never be allowed to enter the boiler.

From the oil separator the steam passes into the heating chamber and mingles with the cold feed water as the latter flows in little cascades over a series of "settling trays." The water is heated to the boiling point and at the same time any mud and carbonates of lime and magnesia that it may contain are precipitated in the trays. These substances would otherwise enter and incrust the boiler, requiring expensive cleaning and repairs. The heater trays, however, are removable through a door and the deposit can be quickly pounded off. The uncondensed steam passes out through the exhaust outlet at the top and may then be used for heating or may escape to the atmosphere.

The heated and purified feed water falls into an ample settling chamber, where the finer sediment settles to the bottom. The level of the water in this chamber is controlled by a float which controls the valve admitting cold water at the top of the heater. An overflow arrangement is also provided, by means of which it is possible to skim the surface of the water in the chamber.

From the settling chamber the water passes **upward** through the filtering chamber, which is tightly packed with fibrous material, and then through the pure water chamber out to the pump suction. Upward filtration prevents floating particles from passing over to the boiler and is peculiar to the Stilwell heater.

Send for our BOOK "MS" on Feed Water Heating.

Property of Ingomar Con. Gold Mining Co., Campo Seco, Calaveras County, California.

WHAT THE USERS SAY:

SAN FRANCISCO, CAL., December 28, 1905.

UNION GAS ENGINE CO., San Francisco,

GENTLEMEN:—The Ingomar Consolidated Gold Mining Company has recently purchased of your firm a 40-h. p. double cylinder engine, the same being operated with crude oil. It gives perfect satisfaction, is easily operated, simple of mechanism, and in every way is what you represent it to be.

We also commend the economic features of the same, that is, the cheapness of operating it. Yours very truly,

INGOMAR CONSOLIDATED GOLD MINING CO.

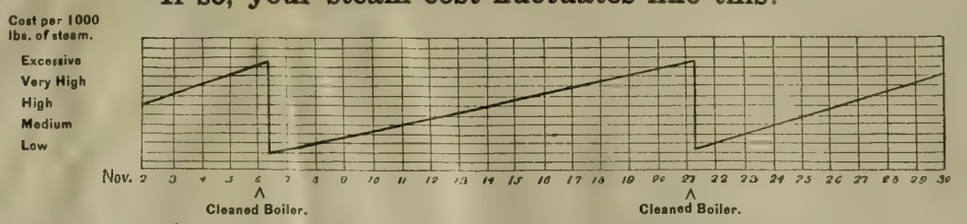
ESTABLISHED 1855

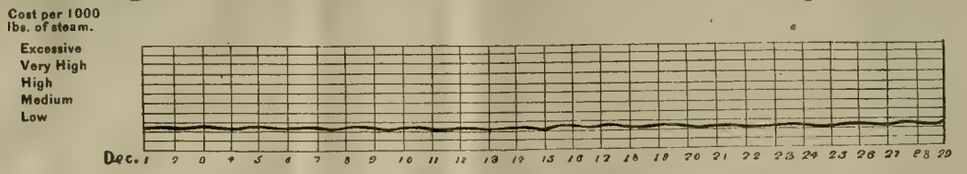
Do You Use Mechanical Cleaners for Your Boilers?

If so, your steam cost fluctuates like this:



Here you will notice that although the cost of steam is comparatively low, right after the boiler scale has been removed, yet it rapidly rises because the scale immediately commences to deposit and thus insulates the tubes.

The Dearborn Chemical Treatment Prevents Scale Forming and the Cost of Steam is Always Low.



As the boiler is always perfectly clean the steam is produced with the maximum of economy.

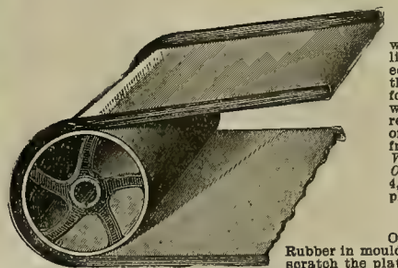
SPADONE'S CONCENTRATOR BELTS.

PATENTED.



This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ⅛ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Send us your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

EDITORIAL.

COMMENCING with this issue, the reading matter has been moved forward so as to precede the bulk of the advertising pages. We believe that the change will please our readers and, by pleasing them, serve the best interests of those who advertise in the MINING AND SCIENTIFIC PRESS. The editorial matter has been moved forward in place of the illustrated page that formerly came first, it being considered best that, as the proper entry into a house is by the front door, so the introduction to a journal should be past its list of contributors, its contents and its editorial comment.

ANOTHER mining excitement is reported from Nevada, this time at a locality about eighty miles northeast of Goldfield. We hope it will prove to be important, for the direction of the discovery is away from the recent trend of prospecting and, if it is of any consequence, it will mean an important extension of the desert mining region.

GREAT shortage of cars is reported on the Mexican Central. The railroad company is giving preference to clean lead ores, as against the more silicious silver-lead output of the mines. In consequence, there has been much delay in the sale of ore, and we learn that one mine in the Santa Eulalia district has actually been unable to ship its production for six months for this reason.

STATISTICS are proverbially subject to error, but they are often made so needlessly. Some of our readers may have noticed last week a wide discrepancy between our figures of gold and silver production as compared with the same data furnished by the Associated Press to the local press. In every instance the daily newspapers made two serious errors. They omitted the output of Idaho, so that the totals given were wrong by $1,500,000 as to gold and over $9,000,000 wrong as to silver. Furthermore, 59,000,000 fine ounces were given as dollars, although the value of the silver produced by the United States was actually, at the average price for the metal, just 61 per cent of that amount. Even editorials were written commenting upon the precious metal production of the country, without any explanation of the apparent statement that the output had grown in value from $32,000,000 to $59,000,000; while as a matter of fact it had increased to $36,000,000.

The Lesson of 1905.

The year just expired is remarkable in our annals for the flood of literature bearing upon corruption in the business life of the country. Lawson's lampoons, the Tarbell dissections of the Standard Oil Corporation, the magazine articles on the beef trust, on municipal corruption and on the iniquities of insurance, have opened the eyes of the most guileless to the manner in which liberty has been turned to license and freedom of opportunity to predatory finance. Many thoughtful men hail these exposures as a harbinger of better things and as tending to prevent similar facility for wrong in the future. We believe that the use of periodical literature to expose corruption has demonstrated the tremendous power of the printed word, but we hold also that unless the result be to make wrong-doing abhorred and to make wrong-doers despised, unless the moral conscience of the people is awakened to logical action, the ultimate effect will be distinctly bad. If we are merely to be made familiar with the workings of corruption and the machinations of the unscrupulous, if people in high places are to be pilloried by the press simply to make a passing sensation, then we shall become morally callous. Unless exposures of wrong serve to prevent their repetition, they will only blunt the sensibilities of people and may even suggest to the evil-disposed the use of methods which were previously unknown. It will be altogether bad for the youth of the country if this or that man, whose nefarious practices have been laid bare, continues to hold his social position and resumes his business prominence, as soon as the storm has blown over. If the president of a railroad company steals by the rebate system, or if the director of the insurance company robs the shareholders by using a position of trust to feather his nest, is it to be wondered if the train conductor pockets fares or the office clerk empties the till? The actions of the small men are held to be contemptibly wicked, while those of the big fellows are deemed clever merely because of the difference in the scale of the operations. If you borrow $5 from an acquaintance and fail to repay, you are anathema, quite properly; but if you get $100,000 from him and others, by skillful misrepresentation, under cover of business, circumventing them by legal proceedings, you may be labeled shrewd and successful.

The fact is that two standards are recognized, one for personal affairs and one for business. 'Business is business' is the modern buccaneer's motto. There are two codes, and people play hanky-panky between them. It is proper to play the game according to Hoyle with your friends, but when you step into the outer arena of the financial world, it is deemed right to lay aside nice sensibilities and to deal from the bottom of the pack; the code is that of the ruffian in Arizona, or "the bad man from Bodie." People smile at the article in a newspaper which demonstrates that an acquaintance stole a million from the city, by bribing its officials or by failing to carry out a contract in honest fashion. They think such a man smart and do not hesitate to invite him to dinner. If he stole their watch or the silver spoons on their mahogany table, they would rate him an unspeakable scoundrel. Bah! The highwayman who took his life in his hand when he held up the wayfarer was a sportsman compared to the financial magnate who sandbags his associates under cover of business; the pirate, who flaunted his black flag and took the risk of being sunk by the first frigate he encountered, was a hero compared to the trustee, who, under cover of his directorship, secured loans for himself on flimsy security. The buccaneers of today are not finer gentlemen than those who flourished in Raleigh's time. Not very long ago Mr. Hadley of Yale suggested that trust magnates and others who debauched the public life of the country should be socially ostracized. Yet Mr. Depew is a trustee of Yale University and presents of money have been accepted by Mr. Hadley officially from Rockefeller. The links of social life are strong and the danger lies in the inability of the people to muster sufficient courage to break them. The talk of punishing the great corruptionists is theatrical; it lacks sincerity. Until it is recognized that stealing on a big scale is as mean as petty larceny, that bribing through an intermediary is as dishonorable as doing it oneself, that the law cannot condone a theft or sanctify a wrong, until then all the writing of the publicists will fail of effect. No community and no country can expect enduring prosperity so long as the recognized code governing its industrial activities is founded on a quicksand of shifting morality.

An Ancient Fallacy.

It is astonishing how foolish ideas survive. We are in receipt of a long and well-worded letter from Washington, signed by an admiral, in which we are recommended to make the purchase of certain shares of a mining company operating at Leadville. We wondered at the courtesy of the eminent naval authority until next day when we received an elaborate prospectus from a well-known promoter residing at New York, accompanied by a letter stating that the prospectus was sent "at the request of" the aforesaid admiral. Certainly not by our request, for we have known Leadville long ago, and would not ask for reliable information through such picturesque sources as these. What an absurdity it is, and how pathetic! An officer of the navy, honored by his colleagues and the owner of a splendid record of service, lends his name to industrial enterprises concerning which his opinion is as valuable as would be that of a cyanide expert regarding the construction of a submarine boat. The company bears the admiral's name and the prospectus contains a report prepared by the promoter, together with a jumble of excerpts and statistics taken from various sources. Fragments are quoted from the published geological writings of A. A. Blow, Francis T. Freeland, Max Boehmer and C. J. Moore, and the authors of the prospectus even know enough to talk of a Professor Emmon, misspelling the name of the greatest of all the authorities on Leadville. Not content with these curious doings, they quote from the columns of the daily press, as though they were a reliable guide

in choosing mining investments. What a vaudeville is to a tragedy, that the performance of this admiral and other retired military and naval gentlemen dabbling in mining affairs, is, when compared to the late Lord Dufferin and his sad experiences with Whitaker Wright. How soon are such object lessons forgotten! It is not long since that certain other retired ornaments of the two services undertook to lead trusting investors through the byways of mining, only to lend their good names to a tricky promotion. Such performances will cease when they, and the public, learn that it is absurd for men, who have spent the whole of their lives in other pursuits, to venture to give advice to, or to act as trustees for, mining investors. Let the admiral stick to his ship, the general to his batallions, the shoemaker to his last.

MINING men interested in the geology of ore deposits will find it profitable to read Mr. Walter P. Jenney's article on the fissure system of the celebrated Ontario lode. The author explains how the mineral solutions, that formed the ore, changed their passage-way from one lode-channel to the other. As to which of the resulting veins is to be given precedence, it is hard to say. It is related that at the time when the Daly and Ontario mines were making their maximum production, there was some rivalry between the shift-bosses of the two properties, although they were under the same management. When a stranger was shown through the Ontario he was told that "the Ontario was a great mine and that the ore held strong going west until the Daly vein robbed her. The Ontario was alright until she struck the spur-veins, but she was no good after that." When, however, the same visitor went underground at the Daly, the shift-boss who accompanied him would be almost sure to exclaim that "the Daly was a fine little mine and had good ore going east until the Ontario robbed her, and then she just quit." Those who read Mr. Jenney's article will see that the difference in the point of view is the result of structural conditions of unusual interest.

The Mining Congress.

On another page we publish an authoritative communication concerning the aims and present status of the American Mining Congress. We were among those who had a poor opinion of this organization until we attended one of the annual sessions and found that it had the support of several men of character, actuated by motives it was impossible to misconstrue. The Congress is gaining dignity by mere age; it lives, despite early vagaries, and each year it wins further consideration. The reading of pseudo-scientific papers has been lessened, the second-rate mine-promoter is not so much in evidence, the mere seekers after temporary notoriety do not crowd the meetings, but gradually men of reputation have had their interest awakened to the point of attending the annual sessions, which are held as far apart geographically as the imperial boundaries of the United States will permit. The desire to see a national Department of Mines, with a Secretary or a chief otherwise designated, is the principal spur to an increase of interest. This is evident from the number of officials belonging to the Geological Survey who find opportunity to read papers and otherwise make an appearance before the Congress. Incidentally, we venture to express the hope that the unwieldy bureau over which Mr. Walcott presides will not be further enlarged, but, on the contrary, that if any development is to take place it may be that known in biology as generation by fission, the forestry and irrigation annexes being given an independent existence so that they may not smother the scientific corps that constitutes the original body of the Survey. But that is another subject; to return to the Congress. We would like to see mining directly represented in the national Government and we believe that the time will come when a subdepartment will be created under that of Commerce and Labor. Our enthusiasm would be much keener if we might expect politics to be eliminated from such a direct relation between the industry and the Government. However, even under the imperfections inseparable from existing conditions, there is reason to believe that such an innovation would be of much benefit to the exploitation of the mineral resources of our country.

Electricity versus Air.

Comparisons between the use of compressed air and electricity are frequently made by the superintendents of mines and mills. Electricity is the wizard of the modern world, and it is not surprising that those who use it imagine that it must supersede all other forms of applying power. Last week we published the confident claim of an electrical engineer and this week there comes a reply in behalf of compressed air. We are glad to see the subject discussed by so experienced an engineer as Mr. Edward Rix, and expect that his letter will interest many of our readers. Electricity has done marvels and in large mines, operated continuously, it has proved economical for pumping, hoisting and tramming. But many a small mine has been prematurely loaded with an electric equipment, ill adapted to intermittent work on a small scale, merely with the idea of being up-to-date. In regard to rock-drills, Mr. Rix has the best of the argument, for, while there are several clever machines on the market, they are yet on trial. No one is looking out more keenly for the electric drill of the future than the big manufacturers of compressed-air machines, and it is certain that the inventor of an accepted type of electric drill will get a first-class reception from everyone interested in mining.

Of course, the electric drills now on the market suffer from being an innovation, and even where they have been tried in mines they have been too hastily condemned. When the old Burleigh drill was first introduced, the miners treated it pretty roughly, disliking to see hand labor superseded. Now they know that the introduction of air-drills has made room for more workingmen by permitting more mines to operate at a profit; they have become accustomed to it. When first taken underground and started to work by an expert, the electric drill also may do well, but as soon as it is turned over to the rough handling of a man who prefers to use air, the operation of the machine becomes unsatisfactory and the superintendent is eventually compelled to discard the use of it. Electricity underground is still a new thing, but it is becoming more familiar every day. This increasing familiarity will help the electrical drill. There are many managers of large mines quite willing to give a fair trial to such inventions and, with the aid of ideas suggested by actual practice, there should be a successful result in the near future.

In regard to the ventilation question, we have always been of the opinion that to ventilate a heading with compressed air is an expensive luxury, at the best. When low-grade oil is used, it is no luxury at all, but a menace to health. One suggestion we venture to offer; and that concerns the waste of air by leakage. It is poor business to expend power in compressing air and then to let it escape through faulty pipe-joints. Many a leak have we seen, and heard, which was wasting more than enough air to run a drill. A good manager ought to instruct his shift-bosses to keep a careful eye on the air-piping and to avoid a source of loss, which is much greater than generally supposed. If you want to employ air for ventilation, use it where it will do good; don't expend it on a draughty crosscut.

ONE of the most successful mining enterprises on record was the Associated Syndicate, organized in 1891, at Adelaide, to prospect in Western Australia. There were six men in it; of these, three were tailors, one was a hotel-keeper, another a jam maker, and the last, but most important, a prospector named Harry Pearce. This man went to Kalgoorlie and 'pegged out' (or located) most of the productive portion of that famous goldfield. The original subscription of the six adventurers was £50 per man; starting with this capital of $1,500, their original holdings within four years had a market value of $7,500,000 per share. They did not retain the ground until development had proved its maximum value, but they held interests and shares which made each of them a rich man. The ground originally located by them became the site of one of the great goldfields of the world—Kalgoorlie—and the basis for stock operations on a tremendous scale. The success of this syndicate and of others of the same kind illustrates the fact that the 'sport' of mining, the taking of chances in prospecting, is still profitable, and that the most money is to be made by buying mines when they are young, leaving it to the more timid to minimize risks by buying ore reserves. The greater risk is compensated by the possibility of a bigger reward.

By the Way.

A distinguished citizen has said lately that:

In the long run the one vital factor in the permanent prosperity of the country is the high individual character of the average American worker, the average American citizen, no matter whether his work be mental or manual, whether he be farmer or wage-worker, business man or professional man.

In our industrial and social system the interests of all men are so closely intertwined that in the immense majority of cases a straight-dealing man who by his efficiency, by his ingenuity and industry benefits himself must also benefit others. Normally, the wage-worker, the man of small means and the average consumer, as well as the average producer, are all alike helped by making conditions such that the man of exceptional business ability receives an exceptional award for his ability. If the less fortunate man is moved by envy of his more fortunate brother to strike at the conditions under which they have both, though unequally, prospered, the result will assuredly be that while damage may come to the one struck at, it will visit with an even heavier load the one who strikes the blow. Taken as a whole, we must all go up or go down together.

The corporation has come to stay, just as the trade union has come to stay. Each can do, and has done, great good. Each should be favored so long as it does good. But each should be sharply checked where it acts against law and justice.

If we of the American body politic are true to the traditions we have inherited, we shall always scorn any effort to make us hate any man because he is rich, just as much as we should scorn any effort to make us look down upon or treat contemptuously any man because he is poor. We judge a man by his conduct—that is, by his character—and not by his wealth or intellect.

Business success, whether for the individual or for the Nation, is a good thing only so far as it is accompanied by and develops a high standard of conduct—honor, integrity, civic courage. The kind of business prosperity that blunts the standard of honor, that puts an inordinate value on mere wealth, that makes a man ruthless and conscienceless in trade and weak and cowardly in citizenship, is not a good thing at all, but a very bad thing for the Nation.

We can get justice and right dealing only if we put as of paramount importance the principle of treating a man on his worth as a man rather than with reference to his social position, his occupation or the class to which he belongs. Individual capitalist and individual wage-worker, corporation and union, are alike entitled to the protection of the law, and must alike obey the law.

To approach the questions which inevitably arise between them solely from the standpoint which treats each side in the mass as the enemy of the other side in the mass is both wicked and foolish. Unless we continue to keep a quick and lively sense of the great fundamental truth that our concern is with the individual worth of the individual man, this Government cannot permanently hold the place which it has achieved among the nations.

It is the man's moral quality, his attitude toward the great questions which concern all humanity, his cleanliness of life, his power to do his duty toward himself and toward others, which really count; and if we substitute for the standard of personal judgment, which treats each man according to his merits, another standard in accordance with which all men of one class are favored and all men of another class discriminated against, we shall do irreparable damage to the body politic.

In the year ending June 30, 1905, there came to the United States 1,026,000 alien immigrants. In other words, in the single year that has just elapsed there came to this country a greater number of people than came here during the 169 years of our colonial life which intervened between the first landing at Jamestown and the Declaration of Independence.

As much as possible should be done to distribute the immigrants upon the land and keep them away from the congested tenement-house districts of the great cities. But distribution is a palliative, not a cure. The prime need is to keep out all immigrants who will not make good American citizens.

In dealing with this question it is unwise to depart from the old American tradition and to discriminate for or against any man who desires to come here and become a citizen, save on the ground of that man's fitness for citizenship. It is our right and duty to consider his moral and social quality. His standard of living should be such that he will not, by pressure of competition, lower the standard of living of our own wage-workers, for it must ever be a prime object of our legislation to keep high their standard of living. It will be a great deal better to have fewer immigrants, but all of the right kind, than a great number of immigrants many of whom are necessarily of the wrong kind. As far as possible we wish to limit the immigration to this country to persons who propose to become citizens of this country, and we can well afford to insist upon adequate scrutiny of the character of those who are thus proposed for future citizenship.

CONCENTRATES.

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and to give information dealing with the practice of mining, milling and smelting.

AN electrolyte is a solution which is decomposable, or is subjected to decomposition by an electric current.

IN order to legally locate a mining claim on the public domain the locator must first make a bona fide discovery of mineral in place.

CARBON DIOXIDE may usually be detected by passing the gas into lime water, or into an ammoniacal solution of barium chloride, when it gives a white precipitate of the carbonate.

THE waste heat from reverberatory and cupola furnaces can be utilized in many ways about reduction works—a little ingenuity being all that is required to make it available.

THE crushing weight of dry yellow pine is about 4,500 lb. per sq. in. Wet and green timber is not nearly so strong as dry timber, and this fact should be remembered when timbers are bought for immediate use in the mine.

MANY of the most important mines of Mexico are in andesite—chiefly gold mines. The principal lead-silver deposits in that republic are in limestone. Of these the mines of the Sierra Mojada and of Santa Eulalia are examples.

THE increase in mining cost at great depth is often offset by better organization, perfected methods, higher extraction of values and a surface equipment more completely suited to the requirements of the mine and reduction of the ore.

CONCERNING underground waters, the general principle is established that underground streams are treated on the same principles as surface streams, and such underground streams can be appropriated and utilized, the same as a surface stream.

THE specific gravity of aluminum is 2.68; its electrical conductivity by the Matthiesen scale is 61; its tensile strength is 22,000 to 30,000 lb. per sq. in. Its coefficient of linear expansion is .0000167 per degree F., and the coefficient of temperature resistance is .00214 per degree.

WEIR measurement of water flowing in streams is not reliable where a large volume of water is passing. That method of water measurement is as accurate for large amounts, however, as the measurement of water through slots under a head of 4 to 6 inches.

THERE are known to be mineral deposits in the Big-horn mountains of Wyoming, but up to the present time nothing of payable value has been developed. The geology of that region suggests the possibility of good mines there. The prospects thus far known are mostly of lead and silver.

ORDINARILY salts are more soluble in hot than in cold water, though in some cases the reverse is the fact. Some salts, soluble in cold water, form insoluble basic salts on heating, making the solution cloudy. There are a few salts only very slightly soluble in water. Calcium sulphate (gypsum) is an example.

GREAT DEPTH in mining is not always synonymous with largely increased water—in fact the, deepest mines in the world are comparatively dry and many of them are dusty in the lowest levels, and water must be taken below for drilling and other purposes. In most deep mines the greatest volume of water is encountered above 1,500 ft. from the surface.

A LARGER number of incandescent lights is always more satisfactory than fewer arc lights underground, for the reason that by the use of the former there is a better distribution of light and the intense shadows characteristic of arc lights. All incandescent lights are not uniformly good. The cheaper grades usually give a much lower efficiency, and are therefore not economical.

A MINING CLAIM located at any time during 1905 required no assessment work during that year (except in those States requiring work as a part of the act of location, which is not required in California), and no work need be performed during 1906 until December, when the first $100 worth of work may be done. It is better to do the work as soon as possible and to do as much as possible, for an undeveloped mining claim has little value.

IN hard-drawing copper wire the texture of the surface of the metal is changed by rolling or hammering, so that the outer portion is rendered dense and hard, and its tensile strength thereby increased, but although the surface of the metal is thus effected, the center remains practically unchanged. When a wire which has been subjected to the hard-drawing process has this outer portion injured by cracking, or it is annealed, its mechanical properties are at once impaired.

FLUMES in cold countries can be protected by covering with plank, and by giving fall sufficiently heavy to produce a rapid current, but no splashing of the water should be allowed to occur or icicles will form, which will result in the flume being clogged with ice. Ditches are in successful operation in South Dakota, where the temperature goes to twenty or more degrees below zero each winter.

ONE of the factors in the low cost of mining at the Homestake mine is the high specific gravity of the ore, which require but 10 cu. ft. to the ton in place instead of 13 as usually figured. Most quartz ores run about 13 ft. to the ton, but the large mass of gold-bearing rock in the lower levels of the Homestake is mostly hornblende schist, carrying considerable iron sulphide—up to 10%, and very little quartz. This easily accounts for the high specific gravity of the ore.

IN timbering drift mines, the method of support depends on the nature of the ground. The usual method is that of posts and caps, arranged either singly or in connected series. In some drift mines the roof stands so well that little timber is required, and the larger boulders are stacked up in heaps, being retained by walls along the gangways. These piles of rocks afford sufficient support to the roof, not more than one-third of the excavated area being given actual support.

THE publications of the U. S. Geological Survey are for free distribution, with the exception of the topographic maps and folios of the geologic atlas of the United States and the monographs. The publications consist of monographs, topographic maps; folios, in which are bound topographic and geological maps; bulletins and professional papers. Full information concerning these can be obtained by addressing the director of the United States Geological Survey, Washington, District of Columbia.

CYANIDE SOLUTIONS should always be calculated by the ton. The employment of gallons in these calculations is obsolete. To figure the amount of solution a tank will hold, square the radius of the tank (inside measurement) and multiply by 3.1416. This gives the area of the bottom. Multiply this by the depth of solution in the tank—to find cubic contents—all measurements being in feet. Multiply this by 62½ lb., the weight of 1 cu. ft of water, and divide by 2000 lb., which will give the tons of water or solution in the tank. A tank 30 ft. in diameter and 10 ft. deep will hold about 220 tons.

OCTAGONAL and circular shafts are occasionally sunk for mining purposes, but are not in common use. There are shafts of these shapes in Mexico 2000 ft. deep. In American practice the rectangular shaft is considered the most practical and useful. The shaft is divided into two or more compartments, in some instances as many as six. These are arranged either in a straight line or in a double line, with an equal number of compartments on each side of the center. L-shaped shafts, such as the Forman shaft sunk jointly by the Overman and Caledonia mining companies, on the Comstock Lode at Virginia City, Nev., are not in use elsewhere. That shaft had four compartments.

ROUGH ASSAYING is very unsatisfactory. It may be sufficient where it is only required to know that the rock tested is sufficiently rich, without doubt, to meet all expenses of mining transportation and treatment, but where the margin of profit is small, something more accurate than 'rough assaying' is necessary. To be proficient the assayer must have a good knowledge of chemistry and mineralogy and, as well, be equipped with a good assay outfit. Although the assay of ores is largely mechanical, the business requires much care and makeshifts are never satisfactory in assaying. Accurate results require careful manipulation, experience, and first-class materials in the way of fluxes, etc.

ON an incline the pressure of a loaded car on the plane of the incline is equal to the natural cosine of the angle of inclination, and the tendency of weight, or backward pull, down the plane is equal to the natural sine of the angle. Thus in a shaft at 65° inclination each ton of 2,000 lb. of the load is 1,812.6 lb. The friction varies, however, not as the sine of the angle, but as the cosine, and its amount is determined by multiplying the weight of the load by the cosine of the angle, and the product by the coefficient of friction. The coefficient of friction in well-constructed straight inclined shafts is small, and due mostly to friction in wheel bearings, sheaves and stress of rope, and that in the hoisting engine itself.

BLANK location notices can be obtained usually at any place dealing in blank legal forms of any kind, particularly in the mining States. The notice required for a relocation is similar to that placed on an original location. It is a good idea not to change the name and to state in the location notice that it is a re-location. A new discovery is not necessary, but a new discovery stake should be set up upon which the notice of re-location is posted, allowing the notice of the former proprietor to stand. This will distinguish the location from other and original locations. A relocator may transfer a portion of his interest in the claim to another whose name is not on the location notice. This makes the partner an interested party to the claim with the same rights as the original locator.

ALTHOUGH timbers subjected to compressive tests by hydraulic presses are compressed from 3 to 4%, and often split and fly to pieces, yet timbers taken from mine caves in the Comstock have been found distorted in shape and compressed to less than one-third their original thickness without splitting or being otherwise injured, and were found so hard as to make it almost impossible to drive a nail into the pieces. The specific gravity of the timber had also greatly increased, due to the increased density of the wood. The timbers were from a caved stope and had been soaked in the scalding water of a flooded portion of the mine for several years. Timbers originally 14 to 18 in. square when placed in the mine were found twisted into rhomboidal shapes about four inches thick and a foot long in cross-section.

TRANSITION CURVES are used and considered necessary in railway construction, but such engineering refinements are seldom attempted in mines, except in shafts where the shaft changes from the vertical to an incline, or from one angle of inclination to another. In such cases where rapid winding is the custom a properly constructed curve is indispensable to safety unless the speed be materially diminished while passing the curve. Side rails of angle iron may be employed in the shaft to prevent the skip leaving the rails on the curve. These side rails, or guides, are secured to the posts of the shaft sets, and placed in such position that they permit the skip wheels to pass between the track rail and guide rail, but sufficiently close to the wheels to prevent them leaving the track rails more than a small fraction of an inch.

IT has been repeatedly stated herein that a co-partner in a mining claim cannot relocate the claim to the exclusion of his partners because of failure to perform the necessary assessment work, thereby profiting by his own negligence. The proper course for him to pursue is to perform the work as required by law and then notify the delinquent partners to contribute their proportion of the expense of this work. Should they fail to pay over the money, then the one who did the work may advertise in the newspaper published nearest the mine, as provided by law, and when all the requirements of the law have been complied with, the title of the property passes to the one who has performed the work required by law, unless in the meantime the delinquent parties pay up their share of the expense of assessment and costs of advertising.

THE cheapest way to roast sulphide ores is in heaps. This method requires the minimum of labor and fuel—only sufficient wood being used to start the ore to burning, the sulphur in the ore supplying the remaining fuel to keep up combustion. Stall-roasting is the next least expensive, being about the same as heap-roasting; but ore roasts in stalls more rapidly than in heaps, and in this respect is more economical. The walls of the stalls concentrate the heat and do away with the necessity of covering the top and sides of the ore pile with fines. Stalls are built both open or covered by an arched roof, as desired, the several stalls being sometimes connected with a stack, to facilitate the roasting process. In heap-roasting there always remains a considerable percentage of sulphur in the ore after roasting —from three to eight per cent.

"A CLAIM HOLDER cannot hold a claim or location for several years without performing in any year the work required, by simply going upon the claim at the beginning of each year and doing a few hours' work, with no bona fide intent to comply with the statutory requirement as to the amount of work done. * * * It is against the policy of the law, and a fraud against the Government and the law, to hold quartz claims by merely doing a few dollars' worth of work thereon at or near the beginning of the year next following the year on which claimant failed to do the necessary work, when such work is not commenced with the bona fide intention of being continued till the full amount is done. Such labor, so done, is a mere pretense and a sham, and will not prevent the relocation for want of necessary work." —Supreme Court California, McCormick v. Baldwin, 104 Cal., 227, 228; 37 Pac., 903.

MILL PLATES should be dressed at least twice daily, and in the event of spots appearing on their surface they should be gone over as often as necessary to remove these, as no amalgam will collect on the yellow, bronze or greenish spots which form on many plates. One good remedy for these spots—produced by copper salts—is an electroplate of silver. If the plate already has the silver plating, it should be given a re-treatment and the amount of silver increased. As a rule too little silver is put on mill plates. The extra expense of the heavier coating of silver will, in most cases, soon pay for itself. Each battery of five stamps should have not less than 150 sq. ft. of amalgamating surface, and more is better. Many mill men will contend that there is no gold passing the lower end of the plate—because they collect so little there. If they gave the lower end as much care as the upper end the result would probably be different.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy.

ELECTRICITY V. COMPRESSED AIR FOR MINE OPERATIONS.

The Editor:

Sir—I have carefully read Mr. Hulbert's article and in answer to your request for a reply from the compressed-air standpoint, wish to say that Mr. Hulbert does not present any new arguments. The objections he mentions have been urged many times and for many years, and yet compressed air for mining purposes is more in vogue, and more popular at the present time than ever before. The general reason for this lies in the fact that its utility is so great that a power economy is in the majority of cases not a prime consideration; in other words, its commercial economy is in most cases where it is used, greater than electricity. To be more explicit, let us take an example.

It is true that an electric rock-drill will probably operate with one-half the power that is required to operate a compressed baby air-drill. It, however, does not cost over $1 per day to furnish compressed air for this drill, and the miners' wages to run it for three shifts would be $9; that is, a total of $10 per day for power and labor. The electric drill, let us say, takes one-half the power and the same wages, or a total of $9.50 per day to operate it. Now, no one will dispute that the air-drill will do at least one-third more work, making the cost for electric drilling $12.66 against $10 for the same footage of holes drilled by compressed air.

Again, when we come to consider air hammer-drills, we find that they take even less power than the electric drills and will drill more feet of holes for the same expenditure of either power or labor. Furthermore, the electric drills have not as yet proved themselves to be a satisfactory substitute for compressed-air machines, and at present they are not seriously considered by practical miners, and we understand that the larger electrical manufacturers do not recommend them. In coal mining electric drills can not be used at all on account of the fire-damp, neither are they adapted to wet mines or, in fact, to practical rock-drilling under the usual conditions.

It is readily granted that electricity is more economical to produce, but when a mine does not get a chance to take advantage of such economical production in the majority of instances, of what use is the argument? Most mines buy their electric power and are charged according to the peak load. In the case of a mill drive this works no hardship, for the load is nearly constant, but when it comes to a hoist that takes, say, 75 h. p. at the peak, and does not average for the 24 hours, 10 h. p., there is a hardship, and here is where the very uneconomical air compressor is installed; it is driven by a 40-h. p. electric motor, the air is stored in proper receivers during the hoist intervals, and the management pays for 40 h. p. instead of 75 h. p., which again shows that we must bow to commercial economy in such matters.

As to the "ventilation" proposition, fresh air is a by-product in using compressed-air drills and costs nothing, and therefore should not be criticised. It is good air in all the cases that have come under my observation, perhaps because our mines use good lubricating oil of 600° fire test. Certainly, if a criminal management chooses to send into their mines noxious gases incorporated in the air, because they use inferior oil, when a proper lubricant is obtainable, it seems hardly in order to blame compressed air for it. Ordinary light galvanized-iron ventilating pipe is not as readily maintained in a working face as standard pipe, and I should judge that a miner would feel a little more secure at a working face with a good stout compressed-air main than he would with a tin air-pipe and an electric wire. In Paris, where compressed air is sold for power, as well as electricity, a great number of small shops take compressed air to generate their electric lights and other power, in order to take advantage of the cold, pure air exhaust for ventilation and the cooling of rooms and provisions.

Exception must be taken to the general statement that modern rock-drills do not use air expansively, for most of the hammer-drills, the very latest addition to the compressed-air devices, use the air expansively to a marked degree. And even regular piston rock-drills reverse their valves before the piston reaches the front head on the forward stroke and about midway on the backward stroke, thus introducing quite an element of expansion. Regarding the advantages of lighting possessed by an electric drilling plant, this does not appeal to me strongly, as I remember on one occasion fitting up electric lights in order to facilitate work in a tunnel heading, and was requested after a few days' trial to remove it, as the miners preferred candles, because, in drilling, they wanted a light directly at the drill-hole, and claimed that the general illumination was not desirable. Electric light is serviceable in lighting shafts and drifts and for large work, but in a working face it is not of such advantage in the ordinary mine that it would pay to endure the inefficiency of an electric drill to obtain it.

Altitude is not the drawback to the use of compressed-air drills that Mr. Hulbert would lead us to believe. While it is perfectly true that it takes more power to compress a sea-level equivalent at an altitude, the sea-level equivalent is not required, because at an altitude the atmosphere, having less pressure, permits the exhaust from the drill to enter the atmosphere with less work expended. For example, at 10,000 ft. altitude the atmospheric pressure is about 10 lb. only, so that the drill exhausts against 10 lb. back pressure instead of 15 lb. at sea-level; consequently, an 80-lb. air-pressure at this altitude will be about as effective as 90 lb. at sea-level. I am of the opinion that 50 h. p. properly applied to a compressor at ordinary mining altitudes will produce just as many feet of drilled holes as it would at sea-level.

I hardly agree with the last sentence in Mr. Hulbert's article, for the industrial field is a wide one and, judging by the patent office reports, the compressed-air industrial mechanisms are already legion, with more to come, and if electricity is operating any more important or numerous class of mechanisms than air-brakes throughout the world, I would like to be advised. The fact is, that electricity is far from monopolizing the industrial field and is even more dependent than compressed air upon the courtesy of steam, without which at most industrial centers electricity would be an expensive luxury.

Port of La Paz, Mexico.

No matter how great the electric power development in this world, it never can be so great as the steam, water, air or gas motive power that brings it into existence; therefore, viewing the present state of the art, electricity has its marked limitations after all. EDWARD A. RIX.

San Francisco, January 8, 1906.

THE KJELLIN ELECTRIC STEEL FURNACE at Gysinge, near Stockholm, Sweden, has been in operation since 1899, and it is claimed the process will bear comparison with the crucible and open-hearth furnaces in production on a large scale. The record shows that 12,000 lb. of ingots are cast in 24 hours. This furnace is chiefly employed in the regular production of tool steel. The specialties manufactured at the Gysinge works are drills and chisels, forged steel for gun barrels, magnets, etc. The special qualities of this steel are its great elasticity, absolute homogeneity, softness and the high proportion of carbon, together with its excellent magnetic properties.

ELECTROLYTIC COPPER.—The fact that certain mines in the region of the Great Lakes yield a mineral so free from objectionable impurities that a high-grade copper is obtainable directly by the simple furnace scorification, early gave Lake copper a premium in the market that electrolytic competition even yet has not entirely wiped out. For almost all purposes there should be no hesitation whatever to-day in specifying electrolytic copper. In conductivity it is superior to nearly all brands of Lake, and in mechanical properties it leaves little to be desired. There are a few classes of work in which the metal is subjected to very severe punishment, such as in the making of cartridges, where Lake seems to stand up better than electrolytic, although even here it is a question how much to allow for the trade prejudices of the older generation of mill foremen who clung so tenaciously to the perplexing system of wire ganges of but a few years past. Any such advantage in Lake copper must be attributed to the fact that it is not so clean as electrolytic. A small quantity of arsenic, for example, while exceedingly detrimental to the conductivity, will appreciably improve the mechanical properties of copper. At one time arsenic was considered necessary in English specifications for firebox copper. Each year a greater proportion of the world's output is electrolytically refined, and it seems probable that before long there will be but two grades of copper on the market—high conductivity copper, which will include electrolytic and picked brands of Lake, and casting copper, covering all material which will not pass a conductivity requirement of 98% annealed.—Lawrence Addicks in *Journal Franklin Institute.*

Forwarding Supplies to Mexico.

Written for the MINING AND SCIENTIFIC PRESS by EDGAR RICKARD.

The Mexican import tariff covers almost every conceivable article of commerce. The preliminary steps necessary in preparing a shipment to Mexico demand a thorough and expert knowledge of this particular class of work, which must cover the classification, packing and proper weighing of the goods. It is necessary to prepare a manifest in Spanish detailing with utmost accuracy the gross, net and legal* weights (in the metric system), the adopted shipping name and character of each individual article forwarded. All of this is imperative; an error in any one will subject the consignee to costly fines at the port of entry, for the custom house officials of Mexico are very active, for the simple reason that they are entitled to one-third the fines imposed. According to recognized tables a kilogram is equivalent to 2.2046 lb. Adv., but, in making the manifest, brokers use an arbitrary ratio of 2.0361 as a basis. In the description of articles, general names will not suffice—no matter how accurate; in one case recorded at the port of La Paz in Lower California, where a consignment of barley was manifested as 'food stuff,' a fine of $300 was paid by the consignee before he could remove his barley from the custom house. Even when the greatest care is exercised, errors are discovered, or invented, and fines imposed. The Progreso Mining Company has been obliged to pay fines on rulings which would seem ridiculous. A number of cases might be cited. Round ¼-in. boiler packing was manifested correctly as 'packing,' but because it was hollow the officials at La Paz declared it 'hose,' and a fine had to be paid. A consignment of P & B paint, manifested as 'paint,' was declared to be 'varnish,' and, although the company paid the Government chemist for an analysis, the report of the local authorities was sustained; and it is quite likely that the same article manifested as 'varnish' will be declared 'paint' the next time. A dozen one-dollar Ingersoll watches were held in the custom house, because the officials decided that the valuation of one dollar should have been five dollars; one watch was sent, at the company's expense, to the City of Mexico for decision, while two were held in the local custom house for comparison, and after the matter was decided, the officials refused to return the watch from the City of Mexico because only the Government is allowed to send jewelry by mail. The weights are often checked with the crudest scales and, if any inaccuracy is apparent, the consignee suffers. A recent case of this kind will explain. The Progreso Mining Company received a consignment of 50 cases of lard, each correctly marked with the gross, net and legal weights. The cases were first weighed separately and checked. Then the entire shipment (3,000 lb.) was placed on the scales, which at that time were inaccurate for large quantities, and the total weight would not check with the sum of the individual weights in each case. No amount of argument could alter the official reasoning, although the scales were immediately afterward adjusted; months later the company recovered the fine. The greater part of this trouble with the fines and inconsistencies practiced is due to the faulty Mexican system before mentioned, which allows the officials one-third of all fines collected and which makes arbitrary decision possible. For some time the provisions forwarded by the Progreso company were inspected with undue diligence and one bottle or can of each kind was opened; and as it was impossible to forward in an open condition over 35 miles of wagon road, the opened cans and bottles were left at the custom house to be consumed by the officials. The company finally arranged to give all of the opened articles to the agent at the port, and thereupon this presumably careful attention to duty stopped and nothing has been opened since then.

The best advice to probable shippers is to employ only the most efficient brokers at the shipping as well as at the receiving end. Errors are costly, as measured in time as well as money.

CALCIUM can be obtained commercially. The usual impurities are silicon 0.2 to 0.5 per cent, aluminum, 0.2 to 0.3 per cent together with traces of iron. The specific gravity of pure calcium is 1.52. Calcium has been found to be sufficiently tenacious to be drawn into wire as fine as 0.5 mm. in diameter, and these wires have a specific electric conductivity of 16 per cent of that of silver.

THE governmental estimates of copper exports from the United States for the year 1905 are 237,000 tons, a decrease of about 10,000 tons from those of 1904. There was, however, an increase in certain manufactured copper and brass wares, not included in the statistics of copper exports, which would bring the actual exports of copper to nearly 30,000 tons in excess of the previous year.

*The 'legal' is the conventional measure used in the trade, such as a pound of tea, a bale of hay, or a 50-lb. sack of flour. It includes the package and does not always weigh exactly the amount stated.

A Big Pocket.*

By JOHN B. FARISH.

I was a boy, visiting my brother, William A. Farish, superintendent of the Sierra Buttes mine, in Sierra county, California, when the big nugget was discovered, in 1868. Jim Winsted, an old prospector and cattle man of that neighborhood, then told me the story of the discovery of the Monumental mine, and, being a boy, the story sunk deeply into my mind. He stated that about the year 1861 or 1862, some merchants and operators from San Francisco were visiting at the Sierra Buttes mine. As they were riding down the trail one of the mules became obstreperous and engaged in some frantic bucking at one point on the trail. The next morning some of the gentlemen returning on foot were noticing the way in which the mule had scratched up the trail, when, to the surprise of all, one of them picked up a little gold nugget worth about a dollar. They kept the discovery secret but prospected to some extent over the hill without finding the source from which the nugget came. Exhausting their vacation and meeting Winsted, they told him of their discovery and exhibited the nugget. Winsted, William Farish and one other systematically prospected the hill, the method being to pan regularly across the hill, noting the points at which the colors of gold failed to appear in the pan. After determining one such line, their pannings were made along a similar course at a higher point on the hill. Along this second course the limits of the gold were found at points nearer together than in the first, the lower line. The third, fourth and fifth lines were determined until two approximate lines were determined extending up and down the hill, diverging at the bottom and converging at the top. Having ascertained this, they commenced sinking holes and trenching in the soft loam and near the apex; it was not long before they located a little narrow seam of very rich decomposed quartz. The quartz was thoroughly decomposed and sprinkled all through with gold. A sluice box was put in and during the summer some $25,000 or $30,000 was washed out from the surface gravel and material from the shaft, which reached a depth of some 25 ft. At this point the crevice, the gold and everything seemed to disappear, and, though the shaft was sunk a number of feet deeper and little drifts were run in each direction, nothing of sufficient value to encourage further work was found, and the Monumental mine became a thing of the past. Winsted embarked in the cattle business and was quite successful in it until the summer of 1868, when affairs went rather against him. One evening going down the trail from the Sierra Buttes mine to his home near Sierra City with a crow-bar on his shoulder and wondering how he could 'raise the dust,' he passed the old Monumental mine, and it still being early in the afternoon, went into the bottom of the old shaft and with the crow-bar began churning a hole along what appeared to be the line of the crevice that had been so rich above. He dug the hole as deep as he could, pulling the dirt out with his hand. The dirt that was taken from the bottom of the hole he carefully tied in his handkerchief and carried it to his house where panning showed enough encouragement for him to do further prospecting. From this point on I was, as a boy, cognizant of the facts, which as I now remember, were as follows: Honest as the old California prospector usually was, he notified all of his old partners, and the claim which had been abandoned and open to location by any one who desired to take it up, was re-located, all partners having the same interests they originally had. Two men were put to work, an Irishman by the name of John Tierney, who had been educated for the priesthood but who had retrograded, and a Mexican known as Mexican Frank. Sluice-boxes were fixed up and in the first three weeks something over $3,000 was washed out. Wandering around over the hills, I showed up one afternoon at the mouth of the Monumental shaft just after the noon hour and saw Tierney and Frank in the bottom eagerly and frantically chopping and prying in a crevice about 8 in. wide. I called to them to know what was the matter, when Tierney exclaimed in an excited way, "The whole bottom of the shaft is solid gold! Look at that!" And with that he held up a piece that was as large as his double fists which he had pried out. Young as I was, I told him that whatever it was to get it out whole and not break it up. They rather objected to this, saying that it would take too much digging and cost too much, but I insisted, and during the conversation my brother, William, appeared, and going into the shaft, supplemented my request with his orders. The nugget as taken out weighed 103 lb. It was boiled in nitric acid for one afternoon and weighed 97 lb. avoirdupois after being cleaned. Some six or eight pieces of it, varying in size from that of a single fist to that of a double fist, had been broken off before the directions came to take it out whole. Had this additional amount not been broken off, the weight would have been augmented by probably 20 or 25 lb. They continued taking out the rich dirt in the bottom of the shaft until midnight, when it gave out as suddenly as it appeared. The total production at this time was $56,000, of which the nugget formed almost half. One of the interests was sold in the excitement for what appeared to be a very small sum, but though the remaining owners did a great deal of work and expended quite a number of thousands of dollars, nothing more has ever been found in the Monumental mine.

*From the 'Gold Hunters of California,' by Thomas Edwin Farish.

Lake Superior Copper Mines.

According to Horace J. Stevens, the copper mines of the Keweenaw peninsula produced 221,000,000 lb. in 1905, as compared with 208,329,248 lb. the year previous. The increase is less than it was for 1904, but the industry is in an extremely healthy condition. Of the total, the Calumet & Hecla produced 82,500,000 lb. Eighteen mines yielded more than a million pounds of copper. Dividends have increased notably, as the following table shows:

Mine.	1905.	1904.
Calumet & Hecla	$5,000,000	$4,000,000
Champion	1,000,000	200,000
Wolverine	660,000	450,000
Quincy	550,000	500,000
Osceola	384,600	192,300
Baltic	1,250,000	.....
Tamarack	120,000	90,000
Atlantic	50,000	.....
Total	$9,014,600	$5,432,300

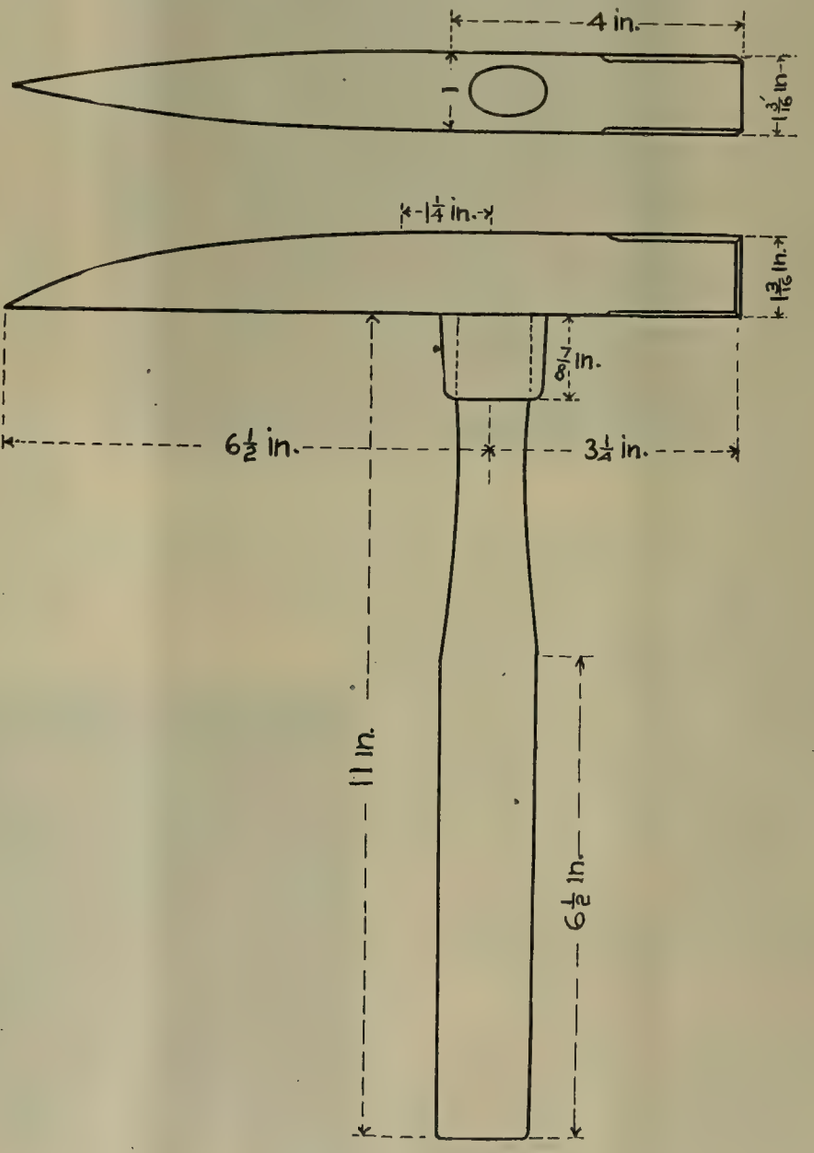
In addition there was $1,540,000 distributed by the Copper Range Consolidated Co., and $279,860 by the St. Mary's Mineral Land Company.

The dividend disbursements for 1905 have been exceeded in total amount during two previous years only. In 1900 the total payments were $9,811,200, and in 1899 they reached the high-water mark of $12,318,450. In that year the Calumet & Hecla alone paid dividends of $10,000,000, due to the company making a large distribution from its immense surplus fund, in addition to paying to shareholders the profits from an unusually good year's business. The 1905 dividends show a much larger aggregate of dividends, from companies other than the Calumet & Hecla, than in any preceding year, and the $5,000,000 dividend disbursements of the Calumet & Hecla by no means represent the total profits. The Lake copper companies could have paid dividends of at least $4,000,000 more than was actually disbursed, from the net earnings of the year, but did not do so, for business reasons that will appeal to all conservative investors. All of the dividend-paying companies have ambitious programs for the future, which will call for heavy outlay for some years to come, and it was deemed better to lay aside large sums for these extraordinary expenses out of the profits of an unusually good season.

Thirteen cents per pound may be accepted as approximately the normal figure for copper, but the price of Lake and electrolytic copper, at the close of the year, is above 18c. As every cent means a bonus of nearly $2,250,000 to the Lake mines yearly, at the present rate of production, the mines are benefiting to the extent of about $1,000,000 monthly from the present high price of the metal. While a portion of this unusual profit is reflected in the dividend declarations, most of the extra profits are going to surplus and into new work.

A Good Form of Sampling Pick.

Notwithstanding the fact that a hand-pick is not a safe instrument for sampling purposes where great accuracy is desired, it is a tool that every manager and superintendent uses constantly. Unfortunately, one cannot go out into the market and buy one that is worth the price, but has to rely upon the pick made by the mine blacksmith. As the proportions of this are important, the present drawing is offered. It will be found to represent an instrument of good shape and proper weight. Such a pick will weigh about 2¾ lb. complete, which is sufficiently heavy for breaking up pieces of rock, knocking off corners and general prospecting work. It should be made of a good grade of pick steel, and the handle must be secured to the head by two cross-wedges of wood and one longitudinal wedge of steel.



A Pick for Use in Sampling.

LAST year the diamonds imported at the port of New York had a value of $30,000,000, and the automobiles imported from Europe were worth about $4,250,000. In both cases the increase of business is enormous and serves to illustrate the luxurious methods of life now prevalent.

Good Mill Construction.

On the opposite page we publish a drawing of the Bustos mill at Guanajuato, Mexico. The accompanying photographs will also serve to illustrate interesting features. In the erection of this plant, bedrock was everywhere available and the heavy masonry walls were built cheaply by Mexican labor, which is particularly adapted to such work. The stamps are of 1,050 lb. weight. The mortars are of El Oro type and weigh 9,000 lb.; they rest upon massive concrete blocks laid in Dyckerhoff cement. The concentrator room is spacious, and has a well designed roof-truss of steel construction. The tailing from the Wilfley tables is in masonry, a concrete launder being carried down the axis of the concentrator room to the center, where it delivers to a tunnel at right angles, and thence to the cyanide annex. While the plant as a whole is being completed, a 5-stamp battery, with its cyanide annex, is being employed for testing the various ores. Even when the 80 stamps are at work, this small addition will be kept in service. In the concentration department of the testing plant there is a Wilfley table, a Gilpin County bumper and an Overstrom table. After being crushed under the stamps, the pulp passes over one of these three machines and then to a sump, whence it is pumped 60 ft. to cone separators. The sand undergoes percolation in vats eight feet deep and eight feet diameter, provided with the Butters hydraulic distributor. The slime is agitated in vats nine feet deep and eight feet diameter; one vat uses the Hobson aero-mechanical agitator and the other a Butters pump with mechanical stirrer. This little testing plant is designed throughout to duplicate the conditions under which the big mill will be operated. The Bustos mill was designed for immediate doubling, excavation for which is now under way. A sufficient space will be excavated back of the present plant to allow of the placing of a second row of 80 stamps on the other side of the bins. A concentrator room, identical with the present one, will be added, so as to make the mill a 160-stamp mill of back-to-back design. Owing to the high price of American lumber when delivered at Guanajuato and the poor quality of the Mexican lumber, it is considered that the use of steel is economical. The plant was designed by Mr. C. W. Van Law, the general manager of the Guanajuato Reduction & Mines Company.

End View of Bustos Mill.

TESTING FOR WOLFRAM.—The mineral is blackish, its weight at once impresses the observer. It would, therefore, not be hornblende, chromite, zinc-blende, tourmaline, or rutile, but might be either wolfram, magnetite, hematite, titantic iron, or tinstone. A piece now very finely crushed give a powder or streak which is neither black nor light-colored. Taking those among which the mineral might be found in the previous tests, it will be seen that it cannot be tinstone (light-colored) or magnetite (black), but, being reddish or brownish, may be wolfram, hematite, or titanic iron. If one now takes a small piece of the mineral and tests it in a blow-pipe flame, and the mineral fuses or melts on the edge or corners, it is, therefore, not hematite or titanic iron, but probably wolfram. Now break from that piece a flake, and the clean, bright sub-metallic luster of a cleavage-face is shown. The presence of the wolfram is confirmed.—*Mining Journal, London.*

SPECIAL ISSUES of the MINING AND SCIENTIFIC PRESS will be issued fifty-two times per annum, one each week. Each issue will contain something of particular interest to the miner, the millman, the smelter and the geologist.

The American Mining Congress.

Written for the MINING AND SCIENTIFIC PRESS.

The American Mining Congress was formed for the purpose of "advancing the mining and metallurgical industries, in all their various branches, within the United States. To assist in bringing about a more perfect co-operation between the Government of the United States and the developing of mining and metallurgy; to encourage education in practical and scientific information in relation to mining, metallurgy and their allied industries; to acquire and disseminate trustworthy information bearing upon the development of the metallic and non-metallic mining resources of the United States; to promote a more co-operative tendency in the evolution of agriculture, mining, manufacturing, transportation and commerce; and for the particular purpose of bringing the mining men of the United States into closer relation with one another, and of promoting a friendly feeling for one another through social intercourse and the discussion of mutual interests."

It would seem that the purposes above quoted are worthy objects to achieve. The American Mining Congress aims to be a national organization. While those who have sacrificed much to make it worthy of its purposes regret it has not achieved more than it has, still they, perhaps more fully than others, realize that the United States is a great country with wonderful business interests and that under these conditions confronting an effort to establish an organization of this character in the confidence of the busy men of this country, requires time, sacrifice and much wisdom.

The question of creating a Department of Mining being one of the purposes of the organization, it has been brought before every session heretofore held. This subject has been ventilated in many ways and at many times, but the program committee at the last session was grievously disappointed in failing to secure the attendance of those who, if present, would have ably discussed the matter. The Congress is planning to advance the interest in this question in other ways than in debating the resolution relating thereto at the annual sessions.

It has been said: "Would it not be a good thing for the Congress to be composed of delegates from the several State mining associations?" This suggestion is good so far as it goes, but there are comparatively few States that have mining associations. Would it be wise to base the existence of this national organization solely on the probability that State associations would exist in each State and that they would send delegates? Those who are selected to guide the work of the Congress deem the organization too important a factor to let its existence rest on so uncertain a basis.

The purpose is to make the American Mining Congress a permanent national organization. There are some who believe that an organization of this character when it demonstrates to busy men (and this takes time) that it can be made an instrument that will be of use to them, it will then, and not until then, receive their co-operation. To do this, wisdom and honesty of purpose must inspire its councils and much work must be done by those who receive no reward but the satisfaction of duty well performed. It is believed by many that this organization so guided can be made the means of giving a wonderful uplift to the mining industry. It is also believed that in this way mining can be largely removed from the speculative and, we may say, gambling basis it now largely occupies in public estimation, and placed more largely on an industrial investment basis.

Those who understand real mining are fully aware that mining, if done on the same basis as banking, manufacturing and railroading, is, on the average, more remunerative and safer than other industrial investments. The certain returns that come from coal, iron, oil, copper, zinc, lead, silver and gold mines in our country, demonstrate that merit exists in legitimate mining. Would it not be of service to the American people if this truth could be made to appear and legitimate mining encouraged and illegitimate mining discouraged? To do this requires the assistance of all who are willing to make a sacrifice to this end, and especially mining periodicals.

Those who are selected to guide the work of the Congress during the coming year invite criticism, both as to their work and the work of the Congress. Legitimate criticism, with a purpose to help, would be of great assistance, and frank discussion of these things could only have a good effect.

NO MINE SUPERINTENDENT should fail to crosscut the country for some distance on either side of his vein. There are numerous instances where the failure to perform this very necessary work has resulted in overlooking the existence of parallel veins or masses of ore which were of great value, and which were later discovered by another. Sometimes it is the fear of encountering a heavy flow of water that deters exploration of this kind. If there is good reason to anticipate such conditions, the diamond drill may be used with good effect, both in prospecting for ore and in determining the existence of water-bearing strata in the vicinity.

Arsenical Gold Ores in South Dakota.

Written for the MINING AND SCIENTIFIC PRESS.

Many of the gold mines of the Black Hills, South Dakota, produce free-milling ores, but not all of them are thus fortunate. In Lawrence county, where are situated the most important mines in the State, the mines on what is locally known as the Homestake Belt are mostly free milling at the surface and not particularly refractory in depth. The ores occurring in the Cambrian and Carboniferous sedimentary rocks are almost without exception refractory, and they are treated by various modifications of the cyanide process; some of these, known as blue ores, owing to the fact that they have been slightly, or at all, oxidized, are not amenable to even the persuasive influences of the cyanide solution. There still remains an unsolved metallurgical problem in the treatment of these Black Hills telluride ores.

In Pennington and Custer counties there are a great many gold-bearing lodes on which a large amount of development has been done. Hoisting plants and mills abound in that section, but only a few of the mines are in operation at present. Various causes may be assigned for this state of affairs. One is that these mining and milling plants have been prematurely installed, the mines not having been developed sufficiently to supply the mills. Another cause for this stagnation is that the ores, free milling at and near the surface, have in depth turned into mispickel. Ordinarily the ore carries fair values (\$10 to \$50 per ton); but, as this material is not easy to treat by the free-milling process, the mines remain idle. There are other districts in the United States where the ore of similar character is being treated successfully. The situation looks discouraging to the owners of the mines in the Black Hills producing these auriferous arsenical ores; but the proposition is not without hope, by any means. Such ore can be as successfully treated in the Black Hills, without doubt, as in Canada, North Carolina or British Columbia. In the vicinity of the mines water power is generally available, timber is usually abundant and railroads are near at hand. In fact, the economic situation is unusually good. What is required is a process which will save a high percentage of the gold and make a by-product of the arsenic and whatever else of value the ore may contain. Possibly the most satisfactory solution of the problem would be the establishment of a reduction plant at some convenient central point, on Castle spring or Rapid creek, where the ores from the various tributary districts might be brought and reduced.

Notable among the mines where this class of ore is found are the Holy Terror, at Keystone; the Extreme, near Custer; the Wheeler Hill, on Castle creek, above Mystic. In addition to these, there are many mines near Rochford where ore of a similar kind is produced. In fact, throughout the southern and central hills these arsenical gold ores appear to be characteristic. The veins vary from 1 to 10 ft. in width, and, as far as development has gone, there seems to be a large tonnage that should pay for treatment by proper methods.

ELECTRICAL TRANSMISSION of power is benefiting from the drought in California. The interruption to stamp-milling, by reason of the lack of water power, is prompting mine-managers to instal electric motors, to afford supplementary power sufficient to serve during seasons similar to that which has been experienced lately. This development will lead to the coustruction of more dams high in the Sierras and the organization of new power companies. At Grass Valley and Nevada City the use of electricity has been based on the utilization of the old ditches built originally for the hydraulic mines; but this is true also of the Mother Lode region. The loss of one branch of mining has been the gain of another.

The Fissure System of the Ontario Mineral Belt.

Written for the MINING AND SCIENTIFIC PRESS by W. P. JENNEY.

Two systems of faulting-fissures occur; the mineral-bearing veins and the verticals. All of these fissures dislocating the strata are prior in formation to the deposition of ore; all have courses in the northeast-southwest quadrant (the strike lying between north 10° east, and east, magnetic). Stated in other terms, post-mineral fissures, faulting the veins after the introduction of the ore, and fissures coursing in the northwest-southeast quadrant, seem to be absent in the Ontario–Daly system; at least, so far as the mines are explored. It is, however, true that fissures with courses northwesterly and southeasterly occur in the Wolverine and other mines, along the southerly margin of the mineral belt.

Fig. 1. Plan of Ontario-Daly Vein-System.

The Verticals.—Numerous faulting-fissures occur irregularly distributed over the whole mineral belt; frequently branching and intersecting, they cut through the sedimentary strata, practically at right angles to the bedding. These fissures are 'verticals.' A vertical may be defined as a faulting-fissure, which in the formation of the orebodies has served as a conduit or channel for mineral solutions. Verticals are commonly barren, or carry only small bunches or seams of ore. They have acted as feeders bringing mineral into the veins, and also into favorable horizons in the sedimentary formations; they are, in fact, the tributaries of the ore-shoots. They are distinguished, in most instances, from the veins with which they connect by less mineralization between walls, and by a dip usually reverse to that of the veins; also the striations upon the walls, which mark the direction of the faulting movement, seldom conform in pitch, in these two classes of fissures. When they encounter the porphyry dikes, the verticals pass through the dikes with but slight change in direction.

When examined, these verticals appear to be the resultant of the latest phase of the block-faulting, which produced the larger fissures and veins; they owe their existence to a torsional stress, caused by the irregular and intermittent movement of the different sides of a displaced block of strata. This torsional force, twisting the huge faulted blocks, has given rise to a great number of diagonal fissures, reaching from vein to vein across each of the included blocks. They are thus seen to be an incident of the extensive fault-movements producing the vein-fissures. Frequently, several verticals diverge at acute angles from a common center, and in their course meet other verticals; the different fissures, radiating from distinct foci, intersecting and uniting in the most complex manner. Owing to the nature of their formation, these verticals do not cross from one block to another, but each group terminates in the larger fissures bounding the block in which they originate. Further, the verticals appear, in the ore-forming period, to have afforded channels for the direct escape of the mineral-vapors and solutions from one vein to the next one parallel to it. The verticals also make deposits of ore in flat sheets formed in the areas of intersection, where these faulting fissures in their course toward the surface cut through favorable horizons in the sedimentary rocks; the largest and most extensive orebodies of this kind occur in the gray limestone at the contact with the upper quartzite.

The sketches showing the structural geology of the mineral belt display, better than is possible by any written description, the block-faulting of the strata and the relation and inter-dependence of the veins and verticals. See Fig. 1, 2 and 3. In the Daly–West mine there is developed a prominent belt of verticals traversing the strip of country 700 to 900 ft. wide, bounded on the north by the Roll fissure; this is designated the Trough; it is the main ore-channel, in which is situated the extensive sheet-deposit of the lime-quartzite contact. A number of small blocks of barren strata intervene between the Roll fissure and the Daly vein; as these blocks are followed to the west into the Daly–Judge, they wedge out, so that the Daly vein in the northwesterly part of that mine will, by future development, be found to form the northerly boundary of the Trough. Near the Quincy shaft the Trough approaches within less than 100 ft. of the surface; thence, going west, the quartzite floor is gently inclined through the Daly–West into the Daly-Judge ground and in a distance of a mile the Trough is 1,500 to 1,800 ft. below the mountain crest. To the north of the Daly vein occurs a broad down-thrown block, practically unexplored, reaching north to the Ontario fissure. It is highly probable that explorations will develop other veins and verticals, situated outside the belt described.

As stated, the verticals of each belt terminate at the veins which bound them, being lost in the vein-fissures at the places of their union. They may thus be pictured as interweaving fissures, the bonds of union, the ligaments linking the veins together. Owing to the prevailing uniformity in the strike of all these faulting fissures, the verticals usually intersect and unite the veins at acute angles, varying from 10 to 20°. See Fig. 3. Where the verticals dip in a direction opposite to that of the veins, they intersect in much shorter distances, vertically, than horizontally. Examined more particularly, it is seen that the connecting verticals in each belt or trough, when bounded by veins parallel in strike or dip, depart from the hanging wall of one vein and incline diagonally upward, to an intersection with the foot-wall of the other. In the deeper mines of the camp, it is found that, in depth, numerous new verticals are encountered, which did not occur in the levels above. These deeper verticals traverse the intervals between the master-fissures, binding vein to vein, forming orebodies at their intersections.

The verticals vary in width from a few inches to four or five feet. Though usually barren, certain of the larger fissures carry small, but workable, bodies of ore. It is observed that the veins and the larger verticals show a marked increase in the width of the fissures and in the strength of the mineralization, as they are followed west, as though the dynamic force producing those ore-bearing fissures had come from that direction. In some instances in the western part of the Daly-Judge mine, a union of verticals forms a typical mineral vein, carrying ore in shoots. There are no hard and fast distinctions in Nature, and not only do the larger verticals, particularly when ore-bearing, often closely resemble normal veins, but a number of those in the second or third groups behave much in the same manner as verticals, in the formation of ore deposits in favorable beds, extending laterally from the fissures.

The Veins.—In this part of the district, four groups may be distinguished:

1. Great fissure veins or lodes, of which the Daly and the Ontario are types. These are the master-fissures of the mineral belt, coursing northeast and southwest, to east and west, magnetic, with dip to the north. They carry ore in long continuous shoots, which pitch uniformly westward.

The Ontario and Daly veins are placed *en echelon;* where they lap one another, the ore channel shunts from vein to vein through the medium of a series of smaller cross-fissures spanning the interval of 600 to 700 ft. The more important of these cross-fractures, known as 'Spur-veins' No. 1, No. 2 and No. 3, carried ore in nearly vertical shoots reaching from the hanging wall of the Daly to the foot-wall of the Ontario. See Fig. 1. So complete, during the deposition, has been this short-circuiting of the circulating waters, that the Daly fissure contracts to a mere seam after passing the belt of spur-veins and cannot be identified in the Ontario workings to the east of this connection; while to the west of the intersection, the Ontario vein does not show any evidences of having been invaded by the waters depositing the ore. Viewed from the standpoint of the miner, the practical effect of this was to make the Daly vein the westerly extension in ore, of the Ontario.

In addition to the 'spur-veins' which are local in occurrence, the Ontario and Daly lodes were impregnated with ore in the most intricate way, through the wide-spread systems of intersecting veins and verticals having a source deep-seated in the igneous core of the mountain. They thus dominate the country in which they occur, drawing their mineral through multiple feeding-fissures that gather to the main lodes the diffused circulating waters of a broad zone.

Each ore-shoot appears to have its individual tributaries, although the uniformity in the composition of the ore indicates a common origin or source of the mineral-bearing waters. From this localizing cause arises the peculiar occurrence in these mines of ore-shoots that do not reach to the surface and which, when followed in depth, are found to terminate, the vein becoming barren below the line of intersection with some tributary fissure; also of isolated bodies of ore surrounded in the fissure by non-mineralized ground, and on the other hand, the existence both in the course of the lode and the dip, of remarkably regular and persistent shoots, formed by the coalesced deposits of a number of verticals.

Viewed thus, the fissure is merely the receptacle for the ore, the place of its deposition, but not the conduit (save possibly in a subordinate way) of the up-flowing waters which formed it. In this respect there is a close resemblance between the shoots of ore in the veins and the sheet-deposit of similar ore in the gray limestone on the quartzite contact; in each instance the intersecting fissures furnish the path of the incoming waters. It will be shown, however, that there exist evidences in the orebodies that the solutions which formed the ore in the veins were different in chemical composition from the solutions replacing the limestone beds.

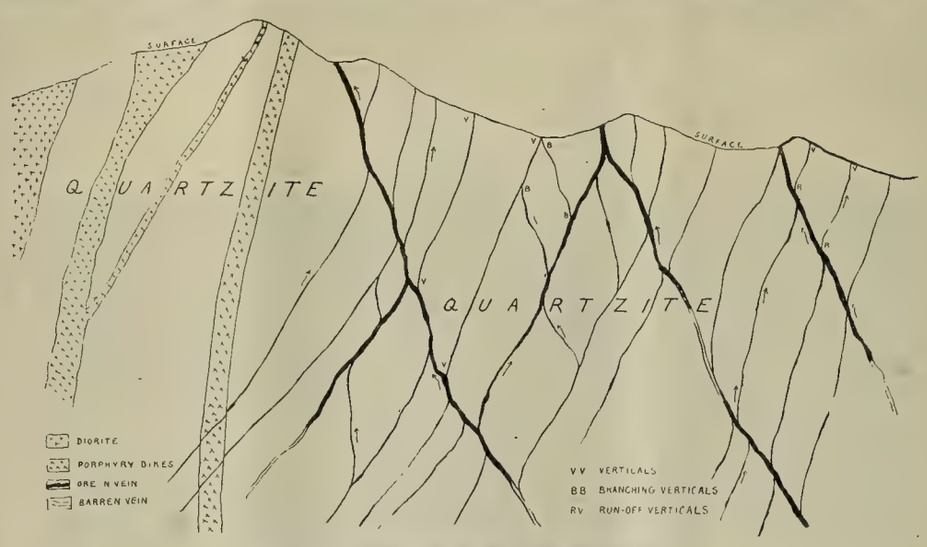

Fig. 2 Cross-Section Showing the Vein-System.

The conditions under which this type of fissure vein occurs in the Ontario belt may be classified as follows:

a. The main lodes of the system dip in a direction away from the igneous core of the mountain, departing in depth further and further from the origin of the ore-depositing circulation.

b. The lode-fissures were formed by an independent dynamic effort following the flank of the mountain-uplift and not its volcanic axis.

c. The fault-movement creating the lodes was in each instance at least 500 ft.; the induced torsional stress in the intercalated blocks giving rise to multiple fissuring, forming the verticals.

d. The nature of the country rock—the hard crystalline quartzite and limestone, shattered and fractured by even small crustal movements, greatly

favored the formation and the preservation of the fissures. Such rocks afford clean fractures and a matrix or fissure-filling permeable to the circulating waters.

2. Fissure veins striking north 20 to 30° east, magnetic, and dipping southeast, including the Back vein of the Daly-West and Daly-Judge mines, and the 'South' vein of the Daly mine.

3. Diagonal fissures, coursing from north 60° east, to east, magnetic, intersecting (on the strike and also on the dip) the veins of the other two groups. The principal fissures of this class dip

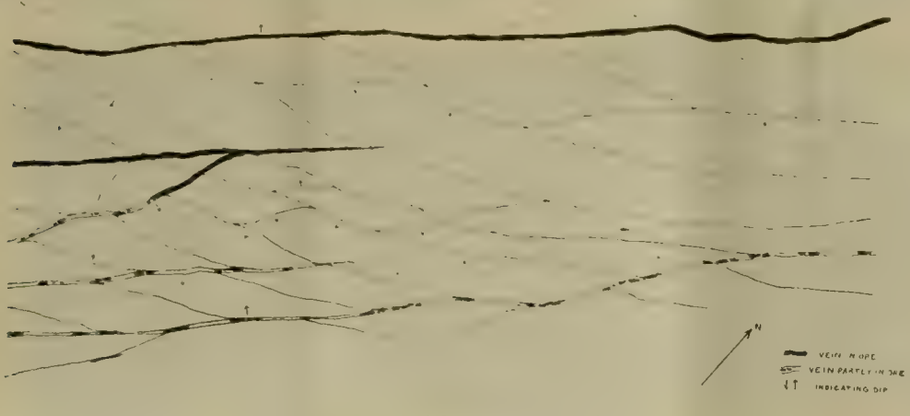

Fig. 3. Plan of Intersecting Verticals.

south; but their branch veins, diverging from the main fissures in their course toward the surface, dip toward the north. Examples of mineral-carrying fissures of this character are seen in the Roll fissure and its branches in the Daly-West mine, and also in the system of branch veins crossing the interval between the Daly vein and the Back vein in the Daly-Judge. The veins of this class appear to terminate where they intersect the Daly vein.

4. Older cross-fissures with strike north 10° to 20° east, magnetic. This system is nearly vertical in attitude, the prevailing dip being east; in some instances when followed either on strike or dip, the fissure turns over and locally reverses its dip. They are usually strong fractures faulting the strata and are in turn faulted by the lodes and veins of ore, namely, the Ontario-Daly system. In the ore-forming period, certain of these cross-fissures appear to have escaped mineralization; others carry long and regular shoots of ore. The American Flag mine, in the hanging country of the Ontario, has been opened to a depth of 1,100 ft. upon a productive fissure of this class.

The so-called 'spur-veins' above referred to, bridging the country between the Daly and Ontario veins, are the faulted section of a belt of similar cross-fissures, which in the deposition of the mineral have been captured by the up-flowing waters and have formed the paths or conduits in the escape of the solutions from vein to vein. In no sense can they be regarded as spurs; they are interlacing veins springing from the hanging wall of the Daly across to the foot-wall of the Ontario.

A NEW LIQUID CHEMICAL compound named 'zorene,' discovered by a Hungarian chemist, is said to possess very remarkable properties. A piece of friable slag, after immersion in it, defied the blow of a heavy hammer. The same effect was produced on brick. Immersing substances in the compound seem to render them impervious to water, as shown by tests in which no additional weight was observed after long soaking in water. Two pieces of steel, one of which had been soaked in the liquid, were submitted to an ammonia test equal to an exposure of five years in the air. The soaked specimen showed no effects from the ammonia, while the other was badly corroded. If these statements prove true the discovery should have considerable commercial value.—*Iron Age.*

THE USES OF ALUMINUM.—Aluminum is successfully used in place of copper as an electrical conductor. If 100 be assumed as the conductivity for copper, 62 is that for the same length and cross-section of aluminum wire. The density of copper is 8.95, that of aluminum 2.67. Assume copper at 18c. per lb. and aluminum at 35c; with like conductivity the cross-section of the aluminum wire is $\frac{10}{6}$, or 1.61, that of copper wire being placed at 1. Under the same conditions the weight of aluminum is 1.61×2.67, or 4.3; that of the copper is 1×8.95, or 8.95. The price, therefore, for aluminum stands at 4.3×0.18, or $1.405, and for copper at 8.95×0.18, or $1.61. With smaller initial cost, less cost of transportation and erection, greater durability and lower cost of maintenance in its favor, aluminum is not so extensively used because of difficulty in making joints, sag due to large coefficient of expansion, and insufficient strength of the wires ordinarily employed for telegraph and telephone lines. A small percentage of copper added to the aluminum increases the strength of the wires, but decreases the conductivity.

Arts of the Mine Promoter.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS.

The successful promotion of mines is no ordinary occupation, nor is the successful mine promoter an ordinary individual. Many who have a little mining knowledge and a smattering of geology feel competent to write a prospectus for the promotion of a mining property in the belief that it will not be a difficult matter to interest capital in the scheme. There is a very wide range in the character of prospectuses—as wide as the range of character of the men who write them; but all prospectuses are not equally good—some of them are decidedly bad, particularly for those who are misled by them. Prospectuses are prepared for various classes of people. The prospectus which excites the cupidity of the uninitiated and inexperienced small investor would probably have no attractiveness whatever for the mining man of experience; and one which would appeal to the latter would, in all probability, find no favor with the former. Prospectuses—honest and to the point—are written by experienced engineers, for mining men whom the promoters know will understand, believe and appreciate the statements made therein, and, if seeking investment, look further into the proposition and probably interest themselves in it. This matter-of-fact prospectus fails to attract the inexperienced man. He sees little in it to induce him to part with his savings.

The statements are too tame, the promised reward too small, and the time of realization all too distant to lure him into making an investment, and yet this prospectus, shorn of all 'glittering generalities,' containing only the information the experienced investor requires, and this information truthful, complete and reliable, would probably lead the investor more surely to success than many propositions couched in terms more remarkable for their magnificence than for their regard for the truth.

Prospectuses often contain the most astounding statements—descriptions of vast veins, with values into the hundreds of dollars, and sometimes into the thousands—statements which no sane or experienced person would believe, and yet these are not infrequently the allurements which secure the money of the unsophisticated.

A mining man not long since said of a promoter: "He is a fine fellow—socially—and a hard worker, and he is successful, too, but he will lie. If the vein is 10 ft. wide and goes $7 or $8 per ton, he will insist with the greatest earnestness and enthusiasm that the vein is 25 to 30 ft. wide and carries from $15 to $20 per ton. He says, 'what is the difference; the mine is all right, and those who take the stock are sure to win anyhow, and, then—how do I know but the vein may not be 30 ft. wide and go $20 or more a little deeper?' "

A man who can allow his belief in a mining property and his enthusiasm in its promotion to carry him away to the extent of misrepresenting the property by 100% to 200% or more is certainly a dangerous person to follow. His argument usually is, "Tell the truth and you will sell no stock." With him "the end justifies the means," and he takes the desperate chance of making profuse promises, which he himself does not believe, but which he endeavors to persuade other people to accept as unadulterated truth. Ordinarily, he is not in it at the finish, but will be found to have disposed of his stock and departed for other scenes—perhaps to find another bonanza mine that possibly he can promote in the same manner elsewhere.

Occasionally these fakirs go to great expense in the preparation of their propositions. Numerous photographs are prepared to illustrate the property. The prospectus is gotten up in elaborate style, and typographically is a work of art. The minutest details of expenses and operation are gone into; sample returns, maps, photographs and drawings accompany the report. Sometimes diamond drill holes are plotted on a sheet, showing in detail every change in rock formation passed through and the assay value of veins—usually sufficiently high to make the vein or orebody appear as a valuable asset, though later it may be found that the alleged values are not obtainable, or the drill holes may never have been bored at all, the dishonest promoter knowing it will take months to discover the falsification.

Where such elaborate preparations are made to place a mine, it is often the case that the property described has little or no actual commercial value, either present or prospective. This is not of infrequent occurrence. In these matters it is often difficult for the possible investor to discriminate. His best safeguard in such cases is the name of the person or persons making the report. If the statements are made over the signature of well-known, reputable engineers, it is more than likely that the statements, no matter how apparently extravagant they may appear, will be found to be borne out by the facts, but if the signers of such prospectuses are obscure and unknown, as well as the property, it is generally safe to let it alone.

On occasion promoters buy or lease newspapers to aid in their promotion schemes, and the literature which emanates from some of these institutions often affords much amusement for mining men who chance to read the alleged scientific reports on unknown and undeveloped mines. Such expressions as 'granite shales,' 'lime dikes,' 'volcanic veins,' 'plutonic replacement,' etc., are not uncommon. One of these descriptions recently stated that the "ore from the 20-ft. vein didn't go quite $1 per lb." How much less than $1 per lb. it contained was not stated, but it may be safely assumed that it was nearly 99c. less, and probably even worse than that. The various paragraphs on 'secondary enrichment,' 'the increase of value and width with depth,' and comparisons with the greatest mines of the world, to which they bear not the slightest resemblance, all are amusing to the initiated, but to the unfortunate ones who are without experience these are evidences of profound knowledge and extensive experience.

THE PROSPECTOR.

The rocks from Holmes, Wyo., are: No. 1, impure limestone, somewhat silicified. It contains very finely distributed pyrite. No. 2 is a dark basic rock (diabase probably), with schistose structure. It contains a great deal of magnetite. No. 3 is limonite (brown iron oxide.) No. 1 and 3 may contain gold and should be tested for the presence of that metal.

The rock samples from Ely, Nev., have been determined as follows: No. 1 gossan (iron oxide). This ore probably covers a deposit of sulphide mineral (chiefly iron), and possibly also copper. No copper shows in the ore, which is completely oxidized, but if gold is present it should be detected by careful panning. No. 2 is an ore consisting largely of silica, iron oxide and copper carbonate. It should be assayed for gold and silver. It is a promising looking ore. No. 3 is limestone and contains some very finely disseminated iron sulphide and crystals of iron oxide. This may also carry precious metals, and should be assayed for them. The Prospector makes no assays. No. 4 is an iron-stained limestone, and is possibly mineral-bearing, but is not so promising in appearance as No. 3. No. 5 is quartzite. It shows no particular promise of precious metals, but if gold is present it should be detected by panning. No. 6 is quartz, in which are seen galena (lead sulphide) and chalcopyrite (yellow copper sulphide). This is a concentrating ore. All of the above rocks are interesting and the most of them give promise of values, the presence of which can only be told by assaying.

The ore from Priest lake, Idaho, marked No. 1, is limonite. It may be from the gossan of a deposit of copper ore, although all the copper has been leached out. The light gray rock, No. 2, is metamorphic, and consists of silica grains and small plates of mica, and finely disseminated iron ore.

The rock specimen from north fork of John Day, Umatilla county, Or., is pegmatite in contact with a silicious mica schist.

The bluish white crystallized mineral from Los Angeles, Cal., is kyanite, also called disthene. It is described by Dana as a basic metasilicate. $(AlO)_2SiO_3$. This mineral occurs in Los Angeles county, Cal., and also abundantly in the Cargo Muchacho mountains in San Diego county, Cal. It has no particular value at present.

The samples from Kitchener, B. C., are: No. 1, dolomite containing gray copper ore (tetrahedrite). No. 2, a dike rock containing small veins of dolomite with gray copper and zinc blende. No. 3, chiefly limonite and quartz, with little hematite, and chalcopyrite. Undoubtedly this is from the iron cap or gossan of a copper deposit. No. 4, limonite from which all the traces of copper have disappeared, if it ever contained any.

North Mountain Power Plant.

Among the power-transmission systems of the Pacific Coast, that have been constructed with an eye to the future, one of the most interesting is that of the North Mountain Power Company. This is placed in the central part of Trinity county, California, two miles below Junction City, where Canon creek, from which the water used for power is obtained, flows into the Trinity river.

The altitude is about 1,480 ft. All material, cement and machinery were hauled over 60 miles of the severest mountain roads, across three distinct divides. It required 18 to 20 animals to pull each of the larger pieces, weighing 18,000 lb., up the grades, and when mud was encountered it was necessary to hitch 18 animals to the fall of a block-and-tackle fitted with steel cables. Despite these difficulties, however, no mishap occurred to any of the machinery.

Eighteen-Horse Team Hauling Part of a 750 K.W. Bullock Alternator.

The water used at the plant is diverted from Canon creek, which has a drainage area of 52 sq. miles above the diverting dam. The upper part of the basin is a rugged, glaciated granite country, reaching to an altitude of 9,000 to 10,000 ft. above sea. level, where some snow remains throughout the year. The higher parts of this basin are in the nature of an immense amphitheater, lying on a flank of Thompson peak. And, as is so often the case, the converging and descending glaciers have scooped out immense holes with almost perpendicular sides, which now form the beds of two lakes. These have been utilized as storage reservoirs. Part of the watershed is heavily timbered and lies within the boundaries of a government forest reserve. This will insure the preservation of the forests, which are so effective in steadying the run-off. The average annual rainfall for the last 33 years at Weaverville, 12 miles from the plant, has been 42.5 in. At the higher levels of the watershed the precipitation is much greater, but no records are available because the country is absolutely uninhabited.

The dam is small, and serves merely for diverting the water. It is of the usual rock-filled crib form. The ditch system consists of alternating sections of ditch, flumes and one tunnel. Part of the ditch is cut in solid rock, but most of it is dug in the side-hill soil, which stands well and puddles well.

The flumes are 19 in number and vary in length from 30 to 1,200 ft. Those immediately below the dam are laid upon a solid bedrock bench and equipped with adequate spill-ways, waste-gates and sand-boxes. The total length of flume is 5,250 feet.

A tunnel 1,821 ft. long has been driven to replace a temporary flume which was unavoidably built upon treacherous sliding ground. This tunnel is heavily timbered throughout its entire length, and tightly lagged except where the rock is unusually hard. The dimensions of the main tunnel are 4 ft. 9 in. by 5 ft. 10 in. in the clear. The total length of the ditch, flumes and tunnel is seven and a quarter miles. The average grade of all is 0.00184 or 9.73 ft. per mile.

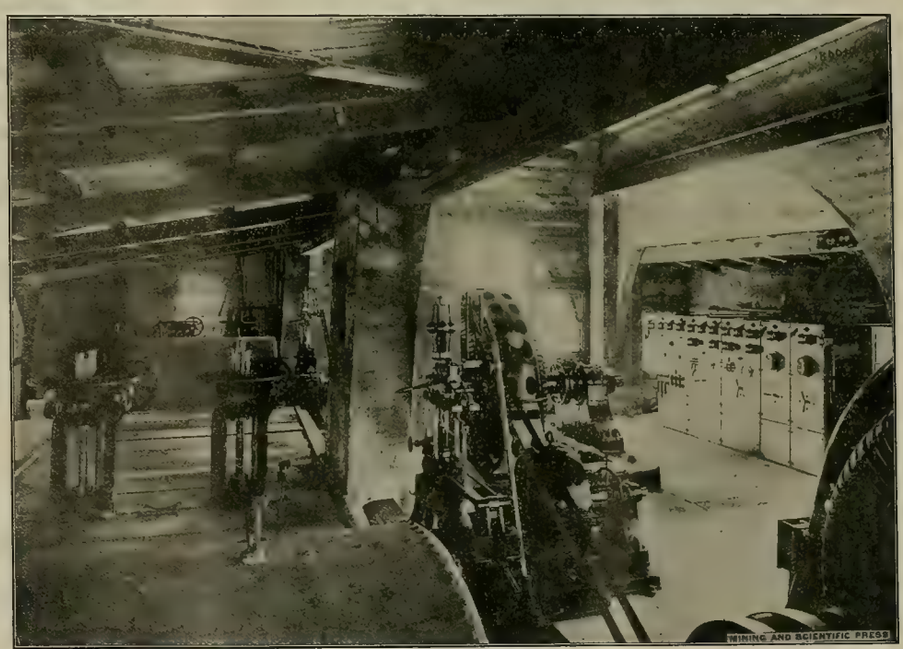
The ditch is provided with waste-gates and sand-boxes at suitable places. The capacity of the ditch is 80 cu. ft. per sec., which is sufficient to operate at full load three units like the two which are now installed. Near its lower end the ditch passes through a gap in the narrow ridge separating Canon creek from Trinity river and terminates in a forebay on the river side of the divide.

A telephone line extends from the power house along the entire course of the ditch to the head dam. Instruments are placed in the station, the forebay tender's cabin, the head-gate tender's house and at several other points along the line. Portable telephones can be readily connected at any point, and, as a result, any place along the ditch can have prompt communication with the power house.

The penstocks, two in number, are each 1,165 ft. long. Under a total head of 604 ft. there is an effective head of 600 ft., or working pressure of 260 lb. per square inch. There is one complete independent penstock for each of the two units. Each consists of a line of 36-in. and 28-in., and at the lower end two lines of 18-in., all riveted steel pipe of various gauges according to its position in the line. At the Ys, or points where the single 28-in. pipe branches into two 18-in. lines, the penstocks are enclosed and anchored in a massive block of masonry laid up with imported portland cement mortar. At their lower ends just before entering the power house they are secured by a similar form of construction, and at various points they are held by bands and anchor-bolts leaded and sulphured into the bedrock. Throughout their entire length they are laid in trenches and covered by back filling, except at their lower ends, where the profile of the hill is such that it was best to lay each in a separate tunnel. After completing and testing the penstocks, the tunnels were walled up and back-filled.

The penstocks are each provided with an 18-in. stand-pipe just outside the forebay walls to allow air to enter when the forebay gates are closed, and thus prevent collapse of the pipe. They are also provided with air-valves and man-holes at suitable points.

The pole line extends almost due west from the plant to the sub-station in Eureka. The length is 65 miles. The line is a single circuit; three-phase; averaging 35 poles to the mile. The poles are redwood at the western end; in the inaccessible stretches the native red fir was the only wood available. Insulators are Locke two-piece single petticoat porcelain, 8½ in. diam. In the fog-belt a larger insulator of similar design is used. Pins are sun-dried eucalyptus, oiled, 1½ in. diam. The spread of wires on the standard length spans is 40 in.; wire is No. 4 copper, except on some long spans where stranded cable is used. The length of spans varies from 50 to 1,400 ft., according to the conditions and topography of the country.



Interior of Power House.

DETERMINATION OF COPPER BY ALUMINIUM FOIL.—Two or three small pieces of foil are added to the copper in sulphuric acid solution (1 to 5) and boiled. In about five minutes all the copper is precipitated, and can either by washed off and weighed on a Gooch filter, or dissolved and titrated by cyanide.—G. E. Perkins, *Jour. Amer. Chem. Society.*

Tube Mills versus Pans.

A comparative test was made recently at the Ivanhoe mine, Kalgoorlie, Western Australia, between grinding pans and tube-mills. Two pans were run against one tube, 3 ft. 8in. diameter and 13 ft. 6 in. long. The first trial was on coarse sand, coming from the separators below a 20-stamp battery provided with 15-mesh screen. This product was run alternately, for a day at a time, through the two pans and then through the tube. This was repeated for ten days altogether.

Sand remaining on 83 tons per day:

Screening.	Feed.	Discharge — Two Pans.	Discharge — Tube-Mill
20-mesh screen	8.5 %	0.0	0.0
40-mesh screen	29.22%	0.12	4.93
60-mesh screen	12.75%	5.24	10 16
100-mesh screen	13.30%	29.00	21.23
150-mesh screen	4.19%	9.35	7.95
Slime, or through 150-mesh	32.04%	56.29	55.73

These figures show that the two pans leave 0.12 per cent of sand coarser than 40-mesh, while the tube-mill leaves 4.93 per cent. The sliming here appears the same with both machines.

The second test was on sliming. In the case of the pans the unground sand from the first pan was sent to No. 2 pan, with the return of unground sand from this pan. The unground sand from the discharge of the tube-mill was returned and entered the mill again with the original feed.

Screening Remaining On	Feed. Av. Wt. Per Day, 31.67 Tons.*	Final Product. — Two Pans.	Final Product. — Tube-Mill
20-mesh screen	9.41%	0.0	0.0
40-mesh screen	28.65%	0.0	0.0
60-mesh screen	12.62%	0.0	0.0
100-mesh screen	12.71%	0.0	0.0

Slime, or through 150-mesh	32.15%	96.75	96.0

*(21.49 tons sand).

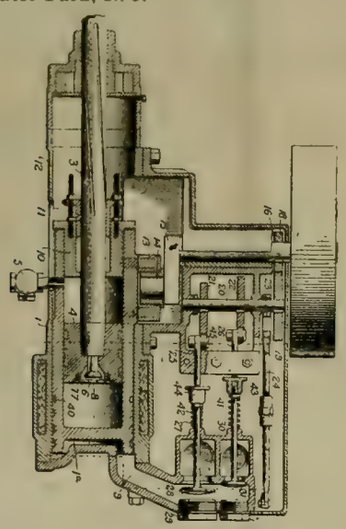
The bad showing of sand on the 150-mesh is due mainly to the insufficient separation, particularly with the larger returns of sand. In the pan trials the return sand worked up to 87 tons per day. The tube-mill return sand, on its four-days' run, ranged from 84 to 306 tons, according to the different sized nozzles used for feeding the mill.

Mining and Metallurgical Patents.

PATENTS ISSUED DECEMBER 19, 1905.

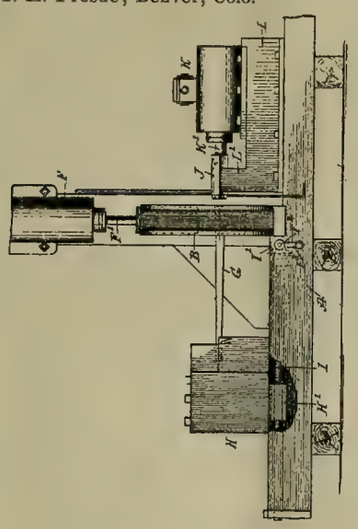
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

GAS ROCK DRILL.—No. 807,399; J. V. Rice, Jr., Edgewater Park, N. J.



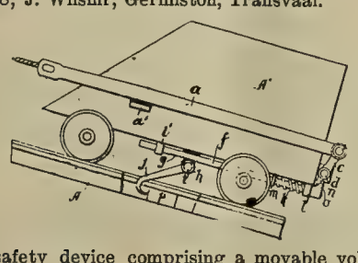
Combination with main cylinder, having at one end explosion chamber, of hollow piston within cylinder, an inner sliding block in piston, air valve arranged in block, piston rod attached to block and provided with longitudinal air passage which is controlled by valve located in block, automatically operating air inlet valve on wall of piston, crosshead on piston, crank shaft, and gas inlet and exhaust outlet valves.

SHARPENING MACHINE FOR DRILL BITS.—No. 807,128; T. H. Proske, Denver, Colo.



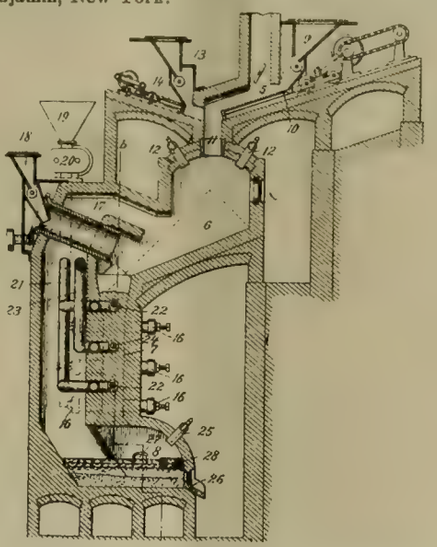
Sharpening machine for drill bits, provided with pair of dies, each having V-shaped recess in working face, recesses registering with each other and tapering from front ends of dies to rear ends thereof, whereby provision is made for holding different-sized drill bits in same recesses of dies with their ends at varying distances from front ends of dies according to size, and dolly having tapering head for entering recesses of dies to upset or sharpen the bits, taper of head of dolly corresponding to taper of recesses and head being of length to enter recesses of dies a distance equal to distance the bit is held within recesses according to size of bit.

SAFETY DEVICE FOR MINE SKIPS AND CAGES.—No. 808,328; J. Wilshir, Germiston, Transvaal.



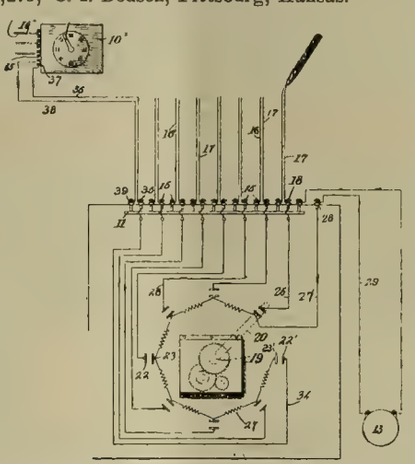
A safety device comprising a movable yoke *a*, a shaft *b*, arms *c* carried thereon, a shaft *d* on which said arms are mounted, a lug *n* on shaft, a spring-actuated bar *f* having a rack formed thereon, a lug *o* thereon engaging lug *n*, a shaft *i* carrying a pinion *h* engaging rack, and a hook *j* mounted on shaft *i*.

METALLURGICAL FURNACE.—No. 808,187; G. H. Benjamin, New York.



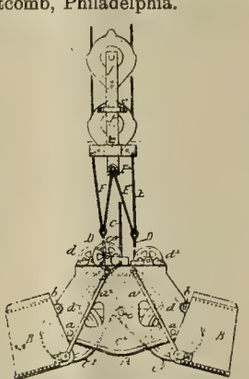
A metallurgical furnace embodying in its construction, a series of arcs, means whereby a reduced ore-body will flow within the zone of action of arcs, and means for introducing a finely divided combining body into ore-body while within the zone of action of arcs.

APPARATUS FOR EXPLODING MINE CHARGES.—No. 808,275; C. I. Dodson, Pittsburg, Kansas.



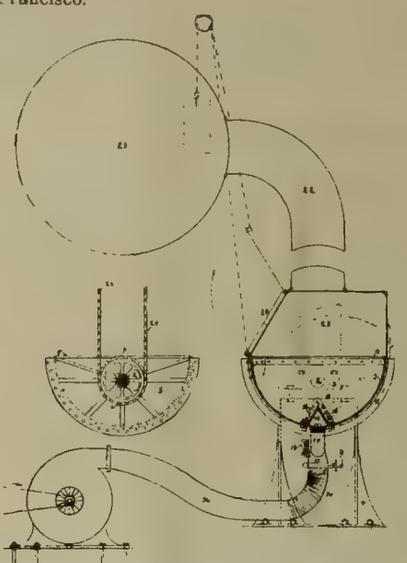
In apparatus for exploding mine charges, a casing, a revoluble arm supported thereby, a circuit-closer carried by arm, a plurality of sets of contacts arranged in an annular series on the casing and adapted to be engaged in successive order by circuit-closer, a source of energy, one pole of which is connected to one of the contacts of each set, a bar supported by the casing and to which the opposite pole is connected, binding-posts arranged in sets, one set connected to the bar and the other set being carried by the casing, current-conductors extending outward from the binding-posts to the charges to be exploded, and conductors extending between the second contacts of each set and the casing carrying binding-posts.

MEANS FOR TURNING HOISTING BUCKETS.—No. 808,493; G. E. Titcomb, Philadelphia.



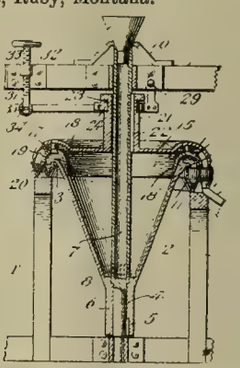
The combination of a hoisting bucket, three sets of ropes leading from the hoisting mechanism to the bucket, one rope being a closing rope and another a holding or opening rope and the third a holding, opening and turning rope, and means connecting the latter rope to the bucket so that when rope is under tension, the bucket will be turned.

PROCESS OF ROASTING ORES.—No. 808,361; H. Haas, San Francisco.



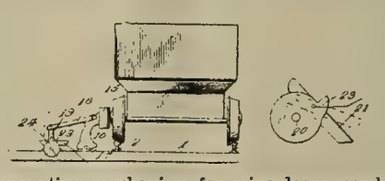
The process of roasting ores which consists of bringing them to the point of ignition, and supplying a light blast of air evenly distributed throughout the whole mass for the purpose of maintaining combustion thereof, and creating a sintered agglomeration, blast being sufficiently light, and being continued for a sufficient time, to drive off and oxidize only the more easily separated molecules of sulphur, or other metalloids, maintaining the heat below the smelting point, and then increasing the blast to separate from the residue the less easily separable molecules of sulphur, continuing to increase the blast as required for the complete separation of the sulphur and then decreasing the blast in proportion to the amount of air decreasingly required to combine with the residual sulphur or other metalloids.

ORE CONCENTRATING APPARATUS. — No. 808,584; X. St. Pierre, Ruby, Montana.



An ore concentrator comprising rotary cone-shaped receptacle having downwardly curved rim, V-shaped concentrate trough surrounding the receptacle and fitting beneath the rim, V-shaped tailings trough surrounding the concentrate trough, hollow shaft extending into the receptacle and being rotatable therewith, cover for the receptacle splined on the shaft and having rim fitting inside the tailings trough, and an annular guide member secured to the cover and having its inner rim fitting into the receptacle and its outer rim formed with a groove fitting over the outer edge of the concentrate trough and the inner edge of the tailings trough.

MINE DOOR.—No. 808,125; A. C. Urban, Buxton, Iowa.



In operating mechanism for mine-doors, combination of a door, means for actuating same, a pressure-bar operable by approaching car, a shaft, an operative connection between shaft and pressure-bar, a door-engaging member mounted on shaft, a detent carried by door-engaging member for engagement with the door, and means permitting operation of the detent independently of the door-engaging member.

MINING SUMMARY.

Specially Compiled and Reported for the MINING AND SCIENTIFIC PRESS.

In 1904, for the fifth time, the total value of the mineral products of the United States exceeded $1,000,000,000, according to the summary continued in the volume 'Mineral Resources of the United States, 1904,' which the United States Geological Survey has recently published in bound form. The figures given in the summary of the volume show a continuation of the activity in the mineral industries of the United States noted in 1900, 1901, 1902 and 1903, although the value of the output for 1904 was about 9% less than that for 1903. The exact figures for 1904 were $1,289,047,146, as compared with $1,419,280,617 in 1903, with $1,260,501,898 in 1902, with $1,086,550,871 in 1901, and with $1,063,678,053 in 1900. As heretofore, iron and coal are the most important of mineral products. The value of the iron in 1904 was $233,025,000; the value of the coal, $444,816,288. The fuels decreased from $634,226,291 in 1903 to $584,483,514 in 1904, a loss of $49,742,777, or 7.84%. Anthracite coal showed a decrease in value of $13,062,428, from $152,036,448 in 1903 to $138,974,020 in 1904. The average price of anthracite coal per long ton at the mine was $2.35 as against $2.50 in 1903, $2.35 in 1902, $2.05 in 1901, $1.85 in 1900, and $1.80 in 1899; and the average price per short ton for bituminous coal at the mine was $1.10, as compared with $1.24 in 1903 and with $1.12 in 1902. The decrease in value of the bituminous coal output from 1903 was $45,845,665, a combined decrease in value of coal of $58,908,093 in 1904. The loss of $130,233,471 in the total value of our mineral production is due to losses in both metallic and non-metallic products, the metallic products showing a decrease from $624,318,008 in 1903 to $541,466,796 in 1904, a loss of $82,851,212, and the non-metallic products showing a decrease from $793,962,609 in 1903 to $747,180,350 in 1904, a loss of $46,782,259. To these products should be added estimated unspecified products, including molybdenum, bismuth, tungsten and other mineral products, valued at $400,000 (as against $1,000,000 of unspecified products in 1903), making the total mineral production for 1904 $1,289,047,146. The manufacture of arsenious oxide, noted for the first time in the United States in the report of 1901, was continued in 1904, but again in decreased proportions as compared with 1902 and 1903. Statistics of the production of sand for moulding, building, engines, and furnace use, and for other purposes, were collected for the first time in 1904. Included in the volume for 1904 is a brief report calling attention to peat in the United States and its possibilities as a source of fuel. Tin was produced commercially, though in small quantities, in South Carolina, South Dakota, and Alaska, and the mines were actively exploited during the year 1904.

ALASKA.

The new schedule of commercial rates for the Alaska cable and land telegraph lines went into effect on January 1. The new rates average six per cent lower than the former rates on commercial messages, and there is a small reduction on press dispatches. The Government has also entered into an arrangement with the Alaska Telegraph & Telephone Company, which operates chiefly in the Nome district, by which messages will be forwarded at a special combination rate. According to the new tariff sheet, a message from Seattle to Nome will be charged at 38c. instead of 40c. per word.

Regarding Alaska, the Secretary of the Interior states that the total permanent white population is 26,000, averaging one person for every nine square miles, and has not increased to any appreciable extent during the past year. Transportation at this time to any portion of the district away from the seacoast is difficult. Several lines of railroad, in addition to those already built, have been projected. The Alaska Central, leading from Seward, at the head of Resurrection bay, on Kenai peninsula, has cleared more than 100 miles; about 30 miles of it are in use, and when completed will terminate in the Tanana valley, toward Fairbanks, a distance of 420 miles. It is intended to keep 1,700 employees engaged on road construction during the entire year, as was done last year, owing to the favorable climatic conditions. This road will be of assistance to the goldfield expected to be opened in the Sushitna valley. The Valdez-Yukon Railroad Co., 63-65 Wall street, New York City, and the Copper River & Northwestern Co. of Seattle, Wash., each propose to build a railroad from Valdez to Copper river and beyond, probably to the Tanana and Yukon, and are now engaged in the actual work of construction. The Alaska Short Line has projected and surveyed a road to run from Iliamna, on the west coast of Cook inlet and head of Alaska peninsula, across the Kuskokwim to Anvik, on the Yukon. A great amount of railroad construction has been done on the Seward peninsula, and much more is necessary to meet the requirements of the mining camps of that section. A board of road commissioners composed of army officers was created by the Secretary of War, of which Maj. W. P. Richardson was designated as chief. The board has provided for the location of a wagon road from the head of Chalmondeley sound to Hetta inlet, on Prince of Wales island; for the survey of a road from Haines mission to Hindestucy, on the Chilcat, to Wells, with the survey of a trail from Wells to the boundary near Pleasant camp; for the collection of data for a road yet to be determined from the head of Gastineau channel to a point near the southern extremity of Berners bay; for the work of relocation and improvement of the trail from Valdez to the mouth of the Gokona river, thence by the way of Big Delta to the Tanana, and down that stream to Fairbanks; for such work of improvement as the funds permitted on the roads leading from the terminus of the Tanana Mines railway to Gilmore, to the Summit, and thence to Cleary creek, and from the Summit to Fairbanks creek; for the preliminary reconnoissance and location of a road from Council City to the east fork of the Solomon river; and a road from Nome northward by the way of the head of the Nome river and toward the Kougarok river. New discoveries have been made in the country between Ketchikan and Juneau, the latest discovery being on the west side of Chichagoff Island, 60 miles north of Sitka. A considerable amount of gold has been taken at Cape Yakataga, about 65 miles east of Kayak. The whole area south of the Yukon and north of the sea seems to be gold producing, a great part being unexplored. The output of gold from the mines for the year has been about $10,000,000. Silver has been produced in considerable quantity from the galena ore in the Sheep Creek mines, near Juneau, and large galena deposits, rich in silver, have been discovered at the head of the Fish river, emptying into Golofnin bay in Norton sound. Copper is being extensively mined, a number of such properties being located upon Prince William sound. The shipment of copper sulphide from the Ellamar mine, Virgin bay, 30 miles from Valdez, has been nearly at the rate of 2,000 tons per month. Plans have matured to construct a railroad from tide water at Valdez to the copper mines on the Chitina river, where the ores are very rich and can be mined at a small cost. Their production will be rapidly increased when transportation facilities to the coasts have been established. Tin is also mined with success in the York district of Seward peninsula, one company having a 20-stamp concentrating mill and 700 tons of ore on the dump, with other groups of claims bonded for large sums. Alaska is also rich in coal.

William Stevens of Redding, Cal., reports that the Alaska Perseverance Company, 5 miles from Juneau, is putting up a 100-stamp mill, a portion of the frame-work being in position, and all of the material on the ground.

Hydraulic mining will begin on Cooper Creek, near the lower end of Kenai Lake, as soon as a flume and a dam can be built to control the waters of Cooper Lake. The Kenai Mining Company owns 640 acres extending up Cooper Creek from the place where it empties into Kenai River, 5 miles from Kenai Lake. The gravel in this property has been worked on a small scale and has proven rich.

ARIZONA.

Yavapai County.

The McCabe mine at McCabe and the Model mine, 14 miles south of Kirkland, have been sold to the Ideal Mining & Development Company, owners of the Gladstone mine. It is reported that the McCabe mine is to be equipped with new boilers, pumps and pipes and that sinking is to be resumed in the main shaft.——It is reported that a 375-ton concentrator is to be put in at Copper Creek, 25 miles east of Mayer, to treat ore from the Rosalie claims. O. B. Stanton is interested.——One of the Congress mills is running steadily on gold concentrating ore from the company's Niagara vein, which lies near and parallel to the original Congress lode.——A hoisting plant with capacity for 4,000 ft. has been purchased for the Octave mine, northeast of the Congress.

In the Los Angeles *Times*, J. H. McClintock states that the copper production increase of Arizona has come largely through the operation of the new Copper Queen smelter at Douglas, though the Old Dominion and United Verde furnaces did 10,000,000 lb. each better than in 1904, and the Calumet & Arizona at Douglas advanced 4,000,000 lb. Owing to floods, the production of the Arizona Copper company and of the Detroit Copper company dropped off materially. The Shannon appears to have held its own. The copper bullion product for 1905 will be found practically as follows:

	Pounds.
Copper Queen, Bisbee	60,000,000
Detroit Copper, Morenci	15,000,000
Old Dominion (inc. United Globe) Globe	27,000,000
Moctezuma, Nacozari, Sonora	10,000,000
Imperial, Silver Bell (smelted by Copper Queen)	6,000,000
Calumet and Arizona (inc. Pittsburg and Duluth and Lake Superior and Pittsburg), Bisbee	34,000,000
Arizona Copper, Clifton	31,400,000
Shannon, Clifton	14,000,000
United Verde (inc. Equator), Jerome	40,000,000
Ore shipments to outside smelters	4,000,000
Total for year	241,400,000

The Phelps-Dodge properties (Copper Queen, Detroit, Old Dominion-United Globe and Moctezuma) produced more than 46% of the total. The company's Copper Queen smelter at Douglas is the greatest in the Southwest and is being added to continually. It has equipment for handling 3,000 tons of ore a day, though it is run at only about two-thirds its capacity. The shipped ores noted in the production table have gone to smelters at El Paso and in Colorado from the Clifton district, from Globe, from the Superior mine in Pinal county, from the Dragoon mountains of Cochise county, from mines in Santa Cruz county, from the Bradshaw mountains near Prescott and from the Grand Canyon district. In the estimate also is included matte from a smelter that has been operated somewhat on the northern side of the Grand Canyon.——The Detroit and Arizona Copper companies are doubling their concentrator capacities.——The Shannon lately installed converters, saving transportation of matte to the Arizona Copper company's smelter.——The Globe smelter has been in operation only a part of the year and is capable of 50% greater output.——A concentrating mill and furnace, with initial capacity of 300 tons a day, will be built by the Imperial company at Silver Bell, Pima county, thus trebling its bullion product.——A new furnace was added lately to the Calumet & Arizona smelter at Douglas.——Improvements being made at the United Verde smelter will permit of fully 50,000,000 lb. of copper product in 1906.——At Humboldt, in Big Bug district, south of Prescott, will shortly be blown in a custom smelter, handling, besides silver and gold, about 300 tons of copper ore a day. In the same vicinity the Rigby plant is approaching completion and the Treadwell smelter is showing signs of activity.

Cochise County.

The Emerald, Lucky Cuss, Silver Thread, Tranquility and Tough Nut mines of the Tombstone Consolidated Co. are short of fuel owing to the snow blockades on the coal-carrying railroads of New Mexico and may have to close down temporarily. The Copper Queen smelters at Douglas are also short of fuel.——J. G. Pritchard, of the San Francisco Mining Co., has bought fifty acres of mineral land adjoining the company's mines at Arizpe.——W. H. Hill is putting in at the property of the Arizona Mining & Developing Company's mine, nine miles south of Naco, a 10-stamp concentrating plant.

The Pittsburg & Arizona Co., near Charleston, has started a double-compartment shaft on the Manila mine, and will sink to a depth of 400 feet.

Superintendent Frank E. Sharpe, of the Kelvin Reduction Co., reports that the new leaching plant has been put in operation. The company is using the MacIntosh process. The plant has a capacity of 35 tons daily, but can be increased by the addition of other rolls. Only carbonate ores are now treated by the process, but sulphides can be handled after a thorough roasting, and the company will soon put in a roasting plant.

Graham County.

The Columbus Copper Co. of New York was recently incorporated to develop mining property near Metcalf. Chas. E. Stevens is in charge and has commenced work.

Gila County.

The Troy-Manhattan Copper Mining Co. has bonded 40 claims owned by J. B. Newman adjoining their Manhattan property and extending to the Dripping Springs wash. A large reduction works is planned by a company and it is reported that the branch standard-gauge railroad will be built, either by the Santa Fe company or the Troy-Manhattan people, from a junction with the Phœnix & Eastern up Dripping Springs wash to the Troy-Manhattan company's mines.

The Globe-Boston Mining Co. has disposed of its properties near Globe to H. A. Smith, acting for Duluth and Michigan parties. It is supposed that they will form a new Bonanza Circle property. The mine has a 500-ft. shaft and has been idle for the past year because of lack of funds.

Mohave County.

It is reported that work is to be started up on the Alexander mines, in Paymaster basin, near Kingman, owned by James Dundon.——F. Stull has leased the Lucky Boy mine, near Chloride, and has begun the shipment of ore.——Shaft sinking at the Idaho mine, at Cerbat, is progressing at the rate of about two feet daily. The property is owned by E. F. Thompson of Kingman, who is preparing to make shipments of ore to the Needles smelter.

C. D. Pickering, superintendent of the Yucca Cyanide Mining & Milling Co., reports that as soon as the compressor of the Yucca mine is in place, work on the deep working shaft will be renewed. This shaft will be sunk to the depth of 1,000 ft.——L. M. Teale and James Polsen are preparing to put in a large steam boiler and pump at the J. F. T. mine, near Kingman. Later a hoist will be brought it.——Hoisting plants are being put on the group of mines, controlled by E. S. Osborne, and Osborne & Wardwell on Bill Williams Fork. On the Blanchard-Butler mines, in the same district, hoists will soon be put in, as the shafts are getting below the depth where whims and windlasses can be used to advantage.

The 50-ton smelter plant recently ordered for the Cleopatra mine has arrived at Jerome, and is now being placed. The smelter is expected to be running within a few weeks.——The diamond drill for the Harryhousen group of mines at Jerome is now on the ground, and is being set up.——Four cars of machinery for the United Verde mine at Jerome have arrived.

Yavapai County.

At the Poland mine, at Poland, new track scales have been put on the high line, and are employed in the weighing of all ore for the Poland mill, and the weighing of all freight passing through the Poland tunnel. The mining being done now is principally on the Poland vein and in the development of the Accidental and other ledges that form a part of the Poland group. The mill is running regularly.

CALIFORNIA.

Nearly all the big mines of the Mother Lode have been compelled to suspend operations owing to scarcity of water. The water in the ditch has turned to ice, shutting off supplies of water for the mines. Only enough has been available to keep water down and supply the towns for domestic purposes. The rains of last week have improved the outlook and all the mines are expected to start up in a few days.

The total oil products for 1905 will aggregate 33,000,000 bbl., which will be 10% increase over the output of 1904. The amount of crude oil exported during the year was 800,000 bbl.; the amount of oil in tankage is estimated to be 10,000,000 bbl.; the manufacture of kerosene has consumed 4,000,000 bbl. The quantity utilized in sprinkling roads and the manufacture of lubricating oils and naphtha have not yet been estimated for the year. The railroads of the State are computed to be consuming 15,000,000 bbl. annually, proving that fuel oil discovery in California and the low prices at which it is being procured have proved a greater boon to railroads than any other line of commerce.

Alpine County.

The Hercules claims at Loope have been taken over by the California Alpine Co. Additional men are being placed at work. In a short time the company will begin the construction of its electric power plant.

Amador County.

At the Defender mine, J. H. G. Wolf, who has been operating the property on a lease, has decided to suspend operations until spring, owing to the difficulties incident to cold weather and bad roads from Jackson.

The Zeila mill, near Jackson, has been closed until repairs have been made to the head frame, which have prevented rock-hoisting.

Butte County.

A new dredger mining company is to be organized by W. P. Hammon, E. J. de Sabla and others in San Francisco, with a capital stock of $1,000,000, paid up, to take

over the properties of the late Thos. Crouch and others at Oroville, on which six dredgers are now operated. More dredgers will be built at once.

On January 6th, W. P. Hammon, of Oroville, John Martin, E. De Sabla Jr. and others, of San Francisco, purchased the gold dredgers and dredging lands of the Feather River Exploration Co. and the Cherokee Gold Dredging Co. The sale will not make any changes in the management of the dredging companies.

Calaveras County.

James Hemerich, of Wallace, struck gold on Dec. 31st at a depth of 11 ft. while digging a well. As a result, shafts have been sunk at various places in Wallace, and in a number of instances gold has been found in paying quantities.

In the Yellow Boy mine at Murphys the main shaft is down 270 feet.

El Dorado County.

Work has been resumed at the Havilah mine at Nashville, after a short shut-down.——A drift is being run north to the old Montezuma shaft and one south of the Havilah mill, by contract.

Inyo County.

T. W. Webb has uncovered a six-foot ledge of molybdenum ore, the concentrates from which run $300 to the ton. Mr. Webb and Dr. Croxall, who are interested with him, have located eight claims and are taking out the ore for the purpose of making a test shipment. The claims are in the western arm of Death Valley.

Kern County.

John Singleton, president of the Yellow Aster Mining & Milling Co., owners of the Yellow Aster mine at Randsburg, admits that the mine will probably be sold. W. F. Botsford was given an option on the property and this option has passed into the hands of an English syndicate, which has had the mine examined and is expected to take up the option.

Madera County.

The new owners of the Zulu mine on French Gulch, east of Madera, are preparing to build a road to the mine and put in machinery as soon as the weather will permit.——Wm. Lawrence, superintendent of the Texas Flat mine at Coarse Gold, reports that the mill at the mine is again in operation, sufficient water having been secured to generate power.

Mariposa County.

The Exchequer Gold Mining Co. is building a concrete dam across the Merced river, near its claims, north of Hornitos and east of Merced Falls, to develop electric power to operate its mines. The company has over one mile of locations on a ledge cut by the Merced river.

Mono County.

The shaft at the Weitfle–Eastwood mine at Masonic is to be sunk another 50 ft. and crosscuts will be run from the lowest point.

Nevada County.

Preparations are being made at the Empire mine at Grass Valley to resume operations independent of the water supply. A large motor, formerly used to operate the mill, is being rigged up to run the pumps. Sufficient water can be had to operate the hoist.——The North Star is making arrangements to keep the mine going in the future without regard to water conditions, though it will be equipped to work with either water or electricity. A new 60-cycle motor is on the way and will be used to keep the mill in operation.

At the Central shaft of the North Star Mines Co. men have all returned to work, after a lay-off, owing to lack of water to operate the machinery. The hoist is being operated by steam and the pumps by electricity. ——The Morning Star mine at Badger hill, near Nevada City, is to be re-opened by H. R. Hicks.

The work of pumping out the north shaft of the Banner mine, which was begun last September, has been completed, and Superintendent Kendall is having a sump cut preparatory to beginning sinking the shaft to a depth of 1,200 ft. Drifts will be run on the vein at each 200 ft.——N. B. Sherhard and M. C. Emerson are clearing out an old incline shaft on the Noble place preparatory to developing the mine systematically.

San Bernardino County.

J. W. Green, of San Bernardino, superintendent of the Gold Park Mining Co., owners of fifty-two claims in Riverside and San Bernardino counties, reports that his company will at once sink a 1000-ft. shaft and will install new machinery, some of which is already on the ground. He reports that the improvements for next year will cost between $30,000 and $40,000.——Thirty-one mining claims on which tungsten has been found in paying quantities changed hands on Jan. 5th, when papers were filed at San Bernardino. The claims are in the St. Elmo district, in the extreme northwest corner of the county. The purchasers are Edward B. Degolia and Ernest M. Atkins of San Francisco. Development work is to be commenced.

San Diego County.

The 100-ton plant of the Julian Reduction Co. at Julian has been started.

In a cave-in at the High Peak mine at Julian, Sidney Pettitt, a miner, was killed and W. W. Boswell, the superintendent, was fatally injured.

Shasta County.

In the suit to quiet title to the Shasta mine, formerly known as the Wiser mine, in the Lower Springs district, against the Gem Consolidated Mining Co. and William P. Miller, Judge Head of Shasta county has given judgment in favor of Mr. Wiser. The judgment quiets title and assesses the cost to the defendant company. The Wiser mine comprises seven claims, a mill and machinery, and for many years has been worked by Henry Miller. Prior to his possession, it was operated by Mr. Miller and the Gem company. Recently Mr. Wiser disposed of the property to the Shasta Mining Co., composed of Gus Hurst, D. McCarthy, James Holt, Robert Martin and W. M. Gunton.

George T. Graves, Charles S. Graves and Charles Avery have deeded a one-fourth interest in the Backbone group of copper mines, consisting of twenty claims, to Joseph A. Kahny.

The Great Western Co. is pushing the main tunnel in its mine at Ingot, from the main works to the Donkey mine. When this tunnel is completed it will have a length of 4,500 ft.——The Sugar Loaf copper claims on Spring creek, owned by Fillius, Grotefend, Galvin and King, have been temporarily transferred to Jacob Fillius of Denver, the transfer being a step toward incorporation under Colorado laws. Extensive development work will be commenced this spring.

Sierra County.

At the South Fork gravel mine, near Forest City, there are 13 men employed under the superintendency of F. W. Kuhfeld. In the east drift the gravel is coming down into the tunnel and prospects well. All preparations are now made for breasting as soon as water arrives so that the gravel can be washed.——The Sierra Buttes mine, Sierra City, has 100 men at work. The two mills are now steadily crushing rock. W. D. Pinkston is superintendent.—— At the Telegraph and White Bear mines work is being done by reduced crews on account of the low stage of water.——Work has been stopped at the Wisconsin and Rainbow mines, near Alleghany, because of lack of water.

The Comet quartz mine in Jim Crow canyon, seven miles from Downieville, has been bonded to T. K. Code, who will commence work at once.

Siskiyou County.

It is reported that work is to be resumed by the Blue Ledge Copper Co., at the head of Joe creek, four miles south of the Oregon line. J. R. Allen is president. The mines may be reached from Callahan.

Following the purchase by the California Consolidated Mining Co. of the rights of Stephens Bros., in the disputed mining property in the Liberty district, it is announced that a new tunnel will be started immediately to connect the Stephens claim with the Mountain Laurel mine. As soon as this is completed, stoping and milling will be commenced.

W. T. Cope of Grants Pass, Or., has purchased from Mr. Page the lease of the Blue Gravel mine and water rights in the Greenhorn district, two miles from Yreka. This mine, which is owned by H. E. Strassler, has been tied up for some time by liens filed on account of work performed and material furnished. It is a bedrock drifting proposition, and has a shaft 116 ft. deep. Mr. Cope has satisfied the holders of the lien, and will put in pumps and a hoist.——W. A Chamberlain, owner of the Black Lead mine, adjoining the Blue Gravel, which is a deep gravel, drifting proposition, has 10 men at work.——Tethrow, Butler & O'Neill, owners of the Highland mine, have received $29,456.15 as net returns from 1,900 lb. of ore recently shipped to the Selby smelter from the Highland mine.

Trinity County.

Robert Hicks has six men at work at the Hunter mine at New River.——J. H. Byers has eight men at work at the Mountain Boomer, near New River. The mill has been shut down because of the scarcity of water.

Equipping the Paulsen mine at Douglas will be begun in the spring by the new owners.

Superintendent J. A. Brent of the Quimby Gold Mining Co. has made his first clean-up at the company's mill on Quimby creek. The clean-up is valued at $3,800. The company is working at a depth of 275 ft. The company has equipped a modern 9-stamp quadruple-discharge mill. The power is furnished by three turbine water wheels. The mill was started on Nov. 17.

COLORADO.

Following is the product of the Colorado plants of the American Smelting & Refining Co. during 1905, namely, the Globe, Pueblo, Eilers, Philadelphia, Arkansas Valley and Durango:

	Net Lb.	GOLD. Oz.	GOLD. Value.	SILVER. Oz.	SILVER. Value.	LEAD. Lb.	LEAD. Value.	COPPER. Lb.	COPPER. Value.	Total.
Colorado	1,748,045,317	463,170	$9,573,724	11,399,763	$6,896,857	99,927,304	$4,697,053	8,920,964	$1,382,750	$22,550,384
Arizona	90,803	185	3,824	4,020	2,452	3,080	145	388	60	6,461
California	216,603	225	4,651	59	36	599	28	504	78	4,793
Idaho	194,015,781	185	3,824	3,152,127	1,907,037	101,002,165	4,747,101	418,530	64,872	6,722,834

Central America	13,635	29	599	6,306	3,815	500	24			4,438
Mexico	3,250,461	16	330	14,024	8,485	681,973	32,053			40,868
Totals	1,964,647,162	481,440	$9,951,364	14,830,722	$8,972,587	203,298,613	$9,555,034	9,459,033	$1,466,150	$29,945,135

The reports of Colorado metallurgical plants for 1905 show the following results on ore treated:

Name of Plant.	Process.	Gold.	Silver.	Lead.	Copper.	Zinc.	Total.
American S. & R. Co. smelters	Lead basis smelting	$ 9,951,364	$ 8,972,587	$ 9,555,034	$1,466,150	$	$29,945,135
Ohio-Colorado, Salida	Lead basis smelting	287,760	459,795	602,446	45,203		1,395,204
United States Reduction Co.	Chlorination and smelting	7,555,000	181,500	272,600	186,000	802,500	8,997,600
Portland, Colorado City	Chlorination	2,228,000					2,228,000
Economic, Cripple Creek	Chlorination	1,832,900					1,832,900
Dorcas, Florence	Chlorination-cyanide	1,029,150					1,029,150
Anaconda, Cripple Creek	Cyanide	133,530					133,530
Wild Horse, Cripple Creek	Cyanide	118,785					118,785
Homestake, Cripple Creek	Cyanide	85,400					85,400
Santa Rita, Cripple Creek	Cyanide	19,195					19,195
Sioux Falls, Cripple Creek	Cyanide	12,200					12,200
Los Angeles, Cripple Creek	Cyanide	7,575					7,575
Micharado, Cripple Creek	Cyanide	4,080					4,080
Boston-Colorado, Argo	Copper basis smelter	1,264,632	229,911		521,420		2,015,963
United States Zinc Co., Pueblo	Zinc basis smelter					1,186,258	1,186,258
Iron-Silver, Denver	Concentration			658,692		735,425	1,394,117
Empire Zinc, Canon City	Concentration	240,000	267,000	375,000		2,160,000	3,042,000
Totals		$24,769,271	$10,110,793	$11,463,772	$2,218,773	$4,084,183	$52,646,791

To facilitate handling 20,000 tons of manganese ore, a tunnel is being run from the Penrose to the Gray Eagle

(Special Correspondence).—The assassination of ex-Governor Steunenberg of Idaho has stirred up the officials of this State and requisition papers have been issued for the man arrested in Idaho under suspicion for the murder of Steunenberg. It is asserted that he is the man who knows something concerning the blowing up of the depot at Independence, Colo., where several non-union miners lost their lives during the strike in the Cripple Creek district. Reports are to the effect that if he is released in Idaho he will be brought to Teller county for trial.——During the year several new railroad enterprises will probably be added to the list of railroads in the State. Several electric lines are being projected. It is reported that the Moffat road entering Gore canyon is again in trouble over the right of way, but it is believed all objections will be overcome without difficulty. ——The United States Mint at this point is lacking one machine which interferes with the coinage at this time, but it is expected to be in position and running by the 20th of this month, and not later than Feb. 1.

Denver, Jan. 8.

Boulder County.

The Red Lion, near Ward, is to resume operations soon. A cyanide mill in connection with amalgamation will be put in the mill.

The Keystone Mining & Development Co. is to resume work at the Dirigo tunnel, near Sugar Loaf, to open up the newly opened-up vein. The tunnel is in 2000 ft. and will be continued 500 ft. further.

Chaffee County.

The mineral production of Chaffee county exceeds that of previous years, and most important discoveries have been made, notably the molybdenum strike on Chalk creek by H. C. Hayes; the Texas gold on the head of Cottonwood creek by I. N. Williams. The Latchaw Tunnel Company, now in Mt. Princeton nearly 3,000 ft., made its initial shipment during the past year.

Clear Creek County.

G. B. Sinclair, of Denver, has commenced work on his claims adjoining the Red Elephant mine, lying on Red Elephant mountain, near Empire.——Benjamin J. Hatmaker of Buffalo, N. Y., is expected in to open up the Coolie mine near Empire.

Fremont County.

An attempt made January 10th to fire the zinc smelter at Canyon City, a $2,000,000 plant, makes the fifteenth attempt at incendiarism in Canyon City in the past two weeks.

Lake County.

The following figures of Leadville's mine tonnage were furnished the *Herald Democrat* by the managers of the various properties:

Name of Mine	Oxidized Iron	Carbonate	Sulphide	Zinc	Siliceous
Western Mining Co.	20,490	1,870	29,350	24,050*	
A. Y. and Minnie			63,466	15,000*	
Midas	30,130	10,104			100,140
Iron Silver Mining Co.	1,700	6,400	43,000	99,800	
Small Hopes	750		363	1,507	15,880
Boreel			150	7,590	
Reindeer		30,000			
Morning Star	40,000				
Evening Star	1,600				
Catalpa	4,000				
New Monarch Mining Co.		10,000	30,000		
Ibex Mining Co.			28,230	1,890	24,000
Yak M., M. & T. Co.			60,000	10,000	
Benton	1,200				
Lillian		300			
Resurrection			5,000		
Ollie Reid			600		
Fryer Hill Mines	10,000				
Fortune			3,750		3,750
Manganese	6,000				
Miscellaneous	17,300	27,500	34,000		10,600
Totals	127,170	86,174	297,909	159,747	154,730

*Concentrates.

Leadville's metal production for 1905 was:

Product	Ounces or Pounds		Market Value	Total Value
Gold	60,205	406 oz.	$20.67	$1,244,446
Silver	5,040,949.09	"	.6035	3,042,213
Lead	55,073,739	lb.	.0475	2,616,002
Copper	5,631,629	"	.156	878,974
Spelter	92,809,800	"	.0575	5,336,563
Maganese	6,000	tons	8.00	48,000
Total				$13,164,198

been put in and a shaft sunk 135 ft. and still going down.

Mineral County.

During 1905 there were 65,000 tons of ore and concentrates shipped from Creede. Two mills in operation produced 8,800 tons of zinc concentrates, averaging 40%. Several trial runs with the newly completed Amethyst mill have proved satisfactory. Dewey Bros. will start the Ridge mill on ore from the mine that they are operating under lease.——The Commodore mine, at Creede, is to be worked by leasers.

Pitkin County.

The American Smelting & Refining Company's figures for the output of Pitkin county for 1905 is as follows:

	Oz.	Value.
Gold	170.00	$ 3,523
Silver	2,320,697.71	1,404,022
	Lb.	Value.
Lead	20,056,019	$ 970,832
Copper	132,768	20,579
Total values		$2,398,956

The output of the county in 1904 was: Gold, 40 oz.; silver, 2,038,181 oz.; lead, 18,882,401 lb.; copper, 9,562 lb. The increase in silver, lead and copper is largely attributable to the high prices that have prevailed, which have caused the opening of old properties and the addition of men in working properties.

San Juan County.

The Silverton *Standard* gives the foliowing summary of tram lines in San Juan county: Iowa Gold Mining & Milling Co., 16,600 ft.; Sunnyside, 16,000 ft.; Silver Lake, 14,700 ft.; Silver Lake Unity Tunnel, 6,000 ft.; Silver Lake from Midway to Mill, 2,000 ft.; Gold King, 3,300 ft.; Silver Ledge, 4,000 ft.; Old Hundred (Howell Hines, Cunningham Gulch) 4,000 ft.; Royal Mining Co., 1,000 ft,; Thunder Tunnel, 1,500 ft.; Contention, 5,300 ft.; Henrietta, 5,460 ft.; Grand Mogul (built this year), 8,500 ft.; Champion (built this year), 1,500 ft.; Hamlet (built this year), 2,000 ft. Statistics of number of men employed show: Silver Lake mill and mine, 350; Gold King mill and mine, 175; Sunnyside mill and mine, 100; Hamlet mill and mine, 50; Champion mine, 65; Ruby mill and mine, 35; Natalie mine, 20; Pittsburg Metal Mining Co. mine, 20; Astor Mine mill and mine, 30; Bull lion King mine, 10; North Star lessees (Solomon) mine, 15; Highland Mary mine, 20; Shenandoah-Dives mine, 25; Green Mountain mill and mine, 80; Silver Ledge mill and mine, summer months, 140; Hercules mill and mine, 75; Old Hundred mill and mine, 110; Mogul mill nd mine, 115; Frisco Tunnel Co., 12.

The output of San Juan county, according to the Denver *Post*, including crude ore and concentrates, partly zinc, during 1905, amounted to 84,065 tons, having a gross value of $3,626,335, which, compared with the yield of 1904, as reported by the United States Mint—$3,572,-119—shows an increase of $54,216. The Gold King, which is accorded first place, produced from its mill 35,000 tons of concentrates; average value, $35 per ton. The Silver Lake mill gave out 16,000 tons, averaging $32.50. The Sunny Side, which amalgamates 77% of the gold contents of its ores, produced 3,813 tons, valued at $20 per ton. The Ross-Champion shipped 1,925 tons of crude, averaging $33 per ton. The Old Hundred mill of 200 tons capacity will be completed by March 1; that of the Green Mountain Company about the middle of February, and the Grand Mogul, with its connecting tramway, on or before April 1. So many hindrances have befallen the operations of contractors engaged in building the Gold Prince 500-ton mill, principally severe weather and blocked or congested railways, it is impossible to fix the date of its completion. The Kendrick-Gilder smelter, above Silverton, under lease to the Ross Mining Company, will produce copper matte from its own properties and from custom ores. Plans are formed to keep the establishment running throughout the year. The Animas Power Company will be supplying electric current to all the larger properties in San Juan county this month from its sub-station near the Silver Ledge mill. The *Standard* reports that the Denver & Rio Grande Railway increased its freight traffic on the line between Durango and Silverton 33% last year. It is said that the company will standard-gauge this line during the year. The Silverton Railroad, with a terminal at the town of Red Mountain, handled during the six months it was open, 6,200 tons of ore and concentrates and 15,000 tons of freight, principally coal and lumber for the mines on the Ouray side of the range. Next spring the line will be extended to Ironton, to accommodate the Crawford Syndicate mines, the Treasure tunnel, the Barstow, Silver Ledge and Ruby basin. The Silverton, Gladstone & Northerly, built by the owners of the Gold King mine, carried for other operators along its line 10,000 tons, and an equal tonnage for the Gold King. Concentrates and a few cars of crude ore made up a total down freight of 35,500 tons. The Silverton Northern, another feeder of the Denver & Rio Grande, carried 132,000 tons, principally to Eureka, where 40,300 tons of concentrates and crude ore were shipped down. The Silver Lake mine, owned by the Guggenheim Exploration Company, suffered a loss of $370,000 in output by the fire which destroyed the midway terminal of its tram line. The yield of the mines for 1905 was 70,000 tons of crude which was reduced to concentrates. The outlook for this year is the most encouraging that has ever been known in San Juan county. When spring opens all the big mills partly constructed in 1905 will be in operation.

San Miguel County.

The Yellow Aster group, near Ophir, has been leased to Telluride people by Frank Maumey, of Telluride.——John P. and John B. Olson are getting the Columbia-Mencna mines, in Savage basin, five miles east of Telluride, in condition for a steady production.

The San Miguel *Examiner* gives the following as the mineral production of San Miguel county for 1905: Tomboy, $820,000; Smuggler-Union, $700,000; Liberty Bell, $400,000; Keystone Placer, $300,000; Alta, $250,000; Butterfly-Terrible, $170,000; Carribeau, $75,000; Carbornero, $65,000; Suffolk, $25,000; Ophir Consolidated, $20,000; Little Mary, $15,000; Mammoth, $10,000; Morning Star, $10,000: Pick-Sessions, $10,000; Saw Pit District, $40,000; Adams, $10,000; miscellaneous, $150,000; total, $3,070,000.——The Liberty Bell Gold Mining Co. has an 80-stamp mill, with cyanide and rag plant. Crushing is done in cyanide solution. The cyanide plant was remodeled the first of the year and three new tube mills put in for re-grinding the pulp. The Stilwell tunnel started by the company three years ago cut the vein in July, 800 ft. under the present workings. Some drifting has been done on the vein and last month an upraise was started to connect with the present workings.——The Tomboy Gold Mines Co., Ltd., has a new 80-stamp mill.——The New Tomboy on the Argentine and Red Cloud claims is worked through the Cincinatti shaft, which is 1,300 ft. deep. David Herron is manager.——The Old Tomboy has been worked in a small way by leasers.——The Smuggler-Union has been operated entirely by leasers during the year. For the first eight months the principal lease was held by Lindsley & King and their product was milled by the company at the new mill. Their lease expired in September and the major portion of the mine, together with the new mill, was then leased to Robeson & Carter, who employ 250 men. The old or Pandora mill, owned by the company, has been running ore from the small leasers, of which Wagner Bros. are the principal, Lindsley, King & Townsend, the Goldfield-Rex Mining Co., the Pandora Gold Mining & Development Co. and others. In July the Pennsylvania tunnel at a depth of 2,600 ft. cut the Smuggler vein 700 ft. under the old workings.——The Japan-Flora Mines Co. has closed down for the winter. T. Walter Beam, the manager, states that arrangements are making for active operations in the spring.——The Cimerron mine and mill have been under lease to Wagner Bros.——The Little Mary mine and 10-stamp mill have been run by local leasers.——The State road to the top of the range through Bridal Veil basin has been completed and much work has been done in the way of development on the properties of the district.——The Mayflower Mining & Milling Co. added four new claims and two new mill sites to their holdings by location.——The Allegheny mill, above Telluride, is to be remodeled. An aerial tramway, with a fall of 3,000 ft. to the mile from the upper to the lower terminal, has been surveyed 2¾ miles to the mine. Leron Henry, local manager, states that work will begin early in the spring.——The Double Eagle Mine & Milling Co., owned by Kansas City parties, cut their vein in the Atlanta tunnel, which has been driving for the past three years, 1,900 ft. from the portal. Drifting on the vein is in progress, and an upraise to the upper workings 250 ft. above will soon be started. This tunnel is driving on the Lewis vein, and it is the intention to push it 3,000 ft. further to connect with the Gold Cable group on the west and the Little Dorrit and Lewis group on the north. J. H. Litchfield is manager.——The Royal, under bond and lease to Eastern parties, has been doing development work.——The Black Bear, in Ingram basin, has recently made a strike of rich ore. A shaft 150 ft. deep has been sunk from the tunnel level. In the spring a hoist, an air compressor and drills will be put in.——The Alta, in Gold King basin, has been operated by the Alta Leasing Co. J. L. Brown is manager.——The San Miguel Consolidated mill, on Bear creek, near Telluride, has run a greater part of the summer on ore from various mines in the neighborhood.——The Adams Gold Mining Co. have been running the Thomas mill.——The Keystone placer, 1½ mile below Telluride, washed the entire season, closing down for the winter the 1st of November.——The Vanadium Alloys Co., of New York, is building an experimental mill of 30 tons daily capacity at Newmire. Wm. T. Rynard. of Chicago, is superintendent.——A small 5-stamp mill is being built at Sawpit for the treatment of the low-grade ores of that district.——The Gold Development Co. of Utah, last year, obtained through E. L. Davis, of Telluride, an option on the Silver Pick and Special Session at Mt. Wilson and started an active campaign. The mine was cleaned out and considerable development work done. The mill was started running on the dump, but the death of Dr. Franklin, manager, in September, caused a shut-down until spring.——In the Ophir district the Butterfly-Terrible was let to leasers early in the spring until the company can put through a tunnel which will open up new orebodies at greater depth. The leasers have operated 16 stamps of the mill.——The Silver Bell, owned by the Ophir Consolidated Mines Co., has been idle the greater part of the year. The ore is refractory, carrying tungsten and gray copper.——The Carribeau-Montezuma has produced regularly, with a small force.——The Suffolk has been worked by a number of small leasers.——The Carbornero has made regular shipments to the smelter at Salida, under the management of Geo. R. Pickett. The Tidal Wave, another property under the same manager, has done a great deal of development work.

Summit County.

(Special Correspondence).—The Germania mine on Little mountain, near Breckenridge, is shipping high-grade silver-lead ore from that portion leased by Engle & Kaiser.——The Sallie Barber on Nigger hill, near Breckenridge, is making large shipments of lead and zinc ores.——The Little Sallie Barber, being developed by County Commissioner Phillips, has made a two-car-load shipment of high-grade zinc ore.——The Chester property in Summit gulch, operated by C. C. Acton, has a ledge opened up by shaft.——The Jesse mine is temporarily closed, awaiting renewal of lease.——The Lucky mine on Mineral hill will have its main shaft deepened 100 feet and new levels opened up on the high-grade shipping lead ores.——The French Creek tunnel into the foot of Mt. Baldy is now in 1,850 ft. and a new zinc ledge has been cut through.

Breckenridge, Jan. 6.

Teller County.

The surface equipment of the Golden Cycle and Theresa properties, near Cripple Creek, is to undergo an overhauling. It was recently announced that the Cycle shaft would be continued to the 1,200-ft. point and the Theresa to the 1,000-ft. point, additions of 200 and 300 ft. respectively. Another hoist is to be added and the ore-house is to be enlarged. Automatic conveyors are to be put in between the shaft, ore-house and dump.——Lease of the Zoe mine, on Beacon hill, has been obtained by Tudor, Ashmore and Colorado Springs associates, for 18 months at 25 per cent royalty. They propose to add 100 ft. to the shaft, which will provide a depth of 775 ft.——That part of the Old Gold mine on Beacon hill, lying above the water level at 400 ft. depth, has been leased by James Brunington and associates for 18 months. They have put men to work. The machinery will not be used at present.

At Cripple Creek the Independence Consolidated and the Vindicator mining companies have been consolidated, the Vindicator appearing as the purchaser of the Independence.——The annual report of the Jo Dandy mine shows that during 1905 there was shipped 12,283 tons of ore, which, after moisture charges were deducted, left 11,838 dry tons, having a net value of $151,728.41. The operating expenses were $76,432.25. The average value of the ore per ton shipped from the mine during the year was $21.06 per ton, while the ore recovered from the dump for the year averaged $11.06.

IDAHO.

Idaho County.

Albert Roberts has resumed work on the Buster mine, near Elk City.——The Asotin property, at the mouth of the Red river, six miles from Elk City, owned by E. E. Espey, is being developed.——Andrew Rader is putting in a new type of gas engine at the Syndicate mine, near Elk City.

Shoshone County.

Actual figures showing the output of the Cœur d'Alene district for the year 1905 are not yet available, but the Idaho *Press* has gathered an estimate of the tonnage as follows: Snow Storm (copper), 96,000 tons; Bunker Hill & Sullivan, 91,000 tons; Federal (Burke, Mace and Wardner mines), 68,000 tons; Morning, 31,000 tons; Hecla, 16,000 tons; Hercules, 14,400 tons; Hunter, 1,200 tons; Stewart, 1,200 tons; Frisco, 500 tons; North Side mines, etc., 700 tons; total, 320,000 tons. The Snow Storm shipped crude ore to the smelter and its estimated value is $10 per ton, making a total value of copper ore shipment for the year of $960,000. Deducting the copper shipments from the total leaves 224,000 tons of lead-silver ore shipped during the year. In 1904 the gross value of the product was placed at $57 per ton, but it should be given a higher value for 1905, because during most of the year lead was much higher than in 1904, while silver advanced also. In view of these facts, $60 per ton is a fair valuation to place on the lead-silver ore, making the total value for the year $13,440,000. Add to this value the copper ore, and the gross value of the output of the Cœur d'Alene district for 1905 is $14,400,000.

MICHIGAN.

Keweenaw County.

(Special Correspondence).—The Calumet & Hecla is sinking a shaft on the old Delaware property, now known as the Manitou. The shaft is in the Montreal River lode, and remains rich, but the company has adopted new rules, by which access to the shaft can be had by authorized parties only.——In the spring the Keweenaw Copper Company will start exploratory work in search of the easterly continuation of the same lode, on the newly acquired Resolute tract.——The Tamarack will continue exploratory work on the Cliff lands. Work on the Cliff during the past season has been done with diamond drills.——At the Miskwabik work has been suspended indefinitely.——The Tecumseh and Rhode Island are continuing exploratory work on an amygdaloid, supposed to be the southerly continuation of the Kearsarge lode.——The Arcadian is sinking a shaft on a newly found amygdaloid, toward the eastern sandstone.——To the south of Portage Lake, the Isle Royale is prospecting for the Baltic lode extension on section 12.——The Superior Copper Company has completed its new power plant, and has resumed sinking. Drifting has been stopped during sinking.——The Section 16 tract of the Atlantic is being prospected for the Baltic lode.——On the Globe tract the new drop-shaft is still sinking through the overburden of sand and boulders.——The Challenge property of St. Mary's Mineral Land Company is being developed under the management of L. L. Hubbard, who opened the Champion mine.——The options of the Erie-Ontario Development Company have been extended to the close of the present year, and development work is being continued.——The King Philip Copper Co. has property near the Winona, on which it is hoped to make a mine.——The Lake Copper Company has an option on the Belt mines.

Houghton, Jan. 8.

MISSOURI.

Jasper County.

During 1905, from the Joplin district there was a total shipment of 252,435 tons of zinc and 31,678 tons of lead, the combined value of the two ores aggregating $13,302,-800. The highest zinc price during the year was paid the last week of January and the first week of February —$60 per ton. The lowest price was paid the second week in June—$43 per ton. The average price during the year was $44.88. Lead reached $80 per ton. The lowest price for lead was $57 per ton, paid in February, March and June. The average price for the year was $62.12 per ton.

NEVADA.

Esmeralda County.

The Deadwood-Nevada Gold Mining Co. is perfecting arrangements for a mill on its claims in the Palmetto mountains, 17 miles south of Silver Peak.

The Booth Gold Mining & Milling Co., of Goldfield, will commence sinking a 200-ft. shaft on the south end line. An electric hoist has been ordered.

Owing to the extremely cold weather, resulting in frozen pipes, the Combination, New Western and the Gardner mills were closed down last week.

A Pittsburg syndicate, at the head of which is Charles M. Schwab, has closed a deal for the Blair gold mines at Silver Peak. The price paid is said to be $750,000.

J. S. Cain has opened up good ore in the drain tunnel being driven on the Prospectus mine at Aurora, 30 miles

from Hawthorne.——The Douglas copper mines, near Hawthorne, have been bonded to Thomas Campbell, who will put in a gasoline hoist and air compressor and sink to the water level.

Lincoln County.

(Special Correspondence).—The year of 1905 opened with a single dividend-paying mine in the Searchlight district, the Quartette. Jan. 1, 1906, has added another, the Duplex, to the list. Jan. 1, 1907, should see nine dividend payers, the new comers comprising the Cyrus Noble, the Searchlight Mining & Milling Co., as soon as their new mills go into commission; the Southern Nevada and New Era mining companies, both of which have opened new ore bodies; and the Searchlight Parallel, the Pompeii, and the Santa Fe mining companies, all of which have ore bodies blocked out, water developed, and should be milling before the end of the year. The Good Hope, Goodenough, Hidden Treasure, New Year's Gift Fraction, Commonwealth and Black Hawk mines have opened ore bodies which are in course of development; the Boulder Mining Co. and the Big Six are sinking to crosscut their ledges at depth. Early development is promised on the Saturn and Searchlight Bonanza mining companies, and on the Navajo, Eddy, Ophir, Minnehaha and Enid groups, and the Octopus and Wandering Boy claims.——At Eldorado canyon the Techaticup, Eldorado, Rand and Venus have opened high-grade ore, and mills are promised for the first three within the year.——At Dupont, the Sazerac mine, owned by the Gold Coin Mining Co., has opened ore at 200 ft. depth, and will sink to the 800-ft. level. The Golden Terra is sinking a 500-ft. shaft; the Searchlight Copper-Gold will sink to the 300-ft. level; the Iyanough has four feet of milling ore with spots of high grade at 150 ft. depth; and the Dupont mine, a tunneling proposition, has opened an ore-shoot of high copper, gold and silver values at the intersection of two veins. —— At Juniper canyon, the Juniper mine is being developed, while the 3-stamp mill is turning out bullion. At the Chiquita mine a 500-ft. working shaft is being sunk on four feet of milling ore. A 10-stamp mill is among the improvements contemplated.——At Knob Hill the Silver Legion mine is undergoing development.

Searchlight, Jan. 2.

A working shaft has been started to go to 200 ft. on the Black Bear group belonging to the Searchlight-Bonanza Mining & Milling Co., of Searchlight. J. E. Depue is president of the company, and H. A. Perkins, vice-president and manager.

J. Y. Mekane has acquired the Potosi lead mine, together with properties near Pioche, for Charles Schwab, who will establish a smelter at Las Vegas, Nev. The ores are separated at the mine and sent down different chutes to an aerial tram, which in turn carries them to a roasting plant. After treatment they will hereafter be concentrated and hauled 22 miles over the old Mormon road, which is down grade except for two miles, to Arden Station, on the Salt Lake route, thence by rail to Las Vegas.

The new hoist in the Bamberger-DeLamar mine, at DeLamar, has been completed and the mill is running to its full capacity.

John Brockman has bought the Duplex and Good Hope mines at Searchlight from G. F. Colton. A three-compartment shaft is to be sunk between the Duplex and Gift veins.

Nye County.

The shaft at the Mayflower mine at Crystal Springs is now down 70 ft. It has been thoroughly timbered and sinking is still in progress. The ledge is widening. It is the intention of the company to order a 25-h. p. gasoline hoist to be used after a depth of 100 ft. is attained.

Judge Breen has filed at Tonopah a decision in favor of E. A. Montgomery against P. E. O'Brien and L. S. Finnegan in the grubstake suit, involving the Montgomery-Shoshone mine at Beatty. The case is reviewed at length and a decision rendered which defines the limits and rights of parties to grubstake contracts, settles many cases pending, and will prevent questionable litigation in future. It confirms the title of Bob Montgomery in the Montgomery-Shoshone mine. It releases from injunction 230 tons of high-grade ore worth $300 per ton, which will now be shipped to Salt Lake smelters, and O'Brien & Finnegan must pay the Montgomery-Shoshone $10,000 (amount of the bond) for damages caused by the injunction which prevented ore shipments. The Montgomery-Shoshone Mines Co. will extend the shaft to 400 ft. on the Shoshone and 300 ft. on the Polaris. They will build a mill of 150 stamps, near Beatty, and construct a tramway to it.

J. R. Masterson, superintendent of the Ohio-Tonopah Mining Co.'s property at Tonopah, is putting in an electric hoist and is arranging to have the company's mill operated by electricity.

NEW MEXICO.

Grant County.

The Last Chance mine at Pyramid has been sold to the Aurora Mines Co. of Aurora, Ill., who will work it under the direction of W. S. Bradley.

Otero County.

The Southwestern Mining Co. is putting in a pipe-line 25 miles from the headwaters of the Sacramento river, in the Sacramento mountains, to Jarilla.

At Highrolls, near Alamogordo, a good lithographing stone is being mined.——In Caballero canyon, near Alamogordo, a deposit of brown commercial onyx has been discovered.

San Miguel County.

The Pecos River Mining Co. is to increase its force and start its mill. For a year past the mines have been under development.

Santa Fe County.

The fire at the coal mines of the Colorado Fuel & Iron Co. at Madrid is, for the time being, beyond control and the mine has been abandoned. The miners formerly employed there have been distributed among the company's other properties.

Socorro County.

The Palomas Chief Mining Co. has uncovered high-grade silver ore in the main tunnel of the mine at Hermosa. The tunnel cut the ore 200 ft. below the old workings and 900 ft. from the tunnel entrance.

OREGON.

Curry County

The Rogue River Copper Milling & Smelting Co., with offices at Roseburg, has been incorporated. The company has bonded claims on Rogue River, in Curry county, and will commence development work.

Jackson County.

Electric power has been put in at the Homestake mine near Woodville. The electric current is to be supplied by the Condor company by a branch line from the Gold Ray-Grants Pass main line.

Josephine County.

A. C. Hoofer states that at the Mt. Pitt mine on Jump-off-Joe, near Grants Pass, there is 1,100 ft. of tunnel on the property. A compressor and power drills are to be put in. The power will be had from a water wheel.

SOUTH DAKOTA.

Lawrence County.

The Lundburg-Dorr mill at Terry is to be increased in capacity by the addition of another sand tank, which will give the mill a capacity of 125 tons of ore per day. The mill is taking in about half its capacity in custom ore from some of the Bald mountain mines.——The Horseshoe Mining Co. is making preparations to turn out its full capacity of ore for the Pluma mill as soon as the plant can be completed.——The Mogul shaft is being unwatered preparatory to taking out ore from the old workings.

TEXAS.

Although extensive repairs have been made in the old Federal smelter at El Paso, and it stands ready for operation at any time, the furnaces have not been started and ore is not yet arriving for treatment.

UTAH.

Grand County.

The Basin Placer Mining Co., which began work December 1, has reached a depth of 1,100 ft. with its bedrock tunnel, which has a vertical depth of over 350 ft. in wash gravel, with no signs of bedrock.

Juab County.

The shaft of the Snowflake mine, near Eureka, is below the 950-foot level and will be continued to the 1000-ft. when drifting will be started.

Salt Lake County.

E. A. Wall has closed down his Bingham mill until the worst of the winter weather is past, and will start on ore from the Phœnix mine.

Summit County.

The Comstock mine in Thaynes canyon, Park City, has been closed after many years of fruitless work. The mine is well equipped.

WASHINGTON.

King County.

James A. Moore of Seattle has left for the East to complete arrangements for the erection of a blast furnace near Seattle, with a capacity of 500 tons daily.

FOREIGN.

CANADA.

BRITISH COLUMBIA.

Boundary District.

Two causes contributed to the smallness of ore shipments from the Boundary mines for the week ending January 6. One was the stoppage of operations by the British Columbia Copper Co. and the Dominion Copper Co., while an agreement was being arranged with the smelter employees regarding an eight-hour day, and the other is the fact that shipments are only figured from the first day of the year, and not for a full week. The output reported was: Granby mines to Granby smelter, 5,114 tons; Emma to Nelson smelter, 191 tons; Providence to Trail smelter, 30 tons; Elkhorn to Trail smelter, 15 tons; Prince Henry to Trail smelter, 15 tons; total for week, 5,365 tons.

MEXICO.

Baja Californ'a.

R. Grivel and Archie Priest, of San Diego county, Cal., are at Ensenada arranging for the sale of their mining properties, about 40 miles southwest of Calexico, to the Benedictine Mining & Milling Co.

Hidalgo.

The shaft of the Santa Gertrudis mine, at Pachuca, in which fire broke out recently, is being repaired. The fire was stopped by suffocation.

Tepic.

The mining district of Compostela, south of Tepic, is being re-opened. The construction of the Guaymas-Guadalajara extension of the Southern Pacific into Tepic will place transportation facilities within easy reach of the mines in the district.——Arthur H. Brewer of Guadalajara is developing old mines on the Espiritu Santo mountain, and is giving employment to 50 men. His holdings include the old Condesa, Frazada, Rosario and San Ignacio mines. Mr. Brewer plans the erection of reduction works.——John Earven of San Francisco is reopening and developing the San Rafael mine in the Compostela district.——Part of the Bartolo mines, southeast of Tepic, have been denounced by Thomas Johnston and N. W. Kinross.

Sonora.

The Yaqui River Smelting & Refining Co. at Toledo are successfully running the new reverberatory furnace recently completed, and are making regular shipments of matte.——H. J. Wood & Co. of Hermosillo have secured, for the Gold Bullion Mining Co., titles to the Etna and Victoria mines at Minas Prietas. The company have commenced sinking a three-compartment shaft. Pedro Penelli is in charge.

Personal.

W. H. ALDRIDGE is at Montreal.

F. W. BRADLEY is on his way to New York.

MARK L. REQUA has returned from New York.

E. DELAFOND, of Mexico City, is at the St. Francis.

R. J. GRANT, of Denver, is examining mines in Mexico.

LEO VON ROSENBERG has returned to New York from Mexico.

J. H. MACKENZIE has returned to San Francisco from London.

EDWARD HAND is manager of the Ymir mine, British Columbia.

ROBERT M. RAYMOND is visiting New York from El Oro, Mexico.

E. R. ABADIE, of Randsburg, California, is at the Palace hotel.

W. SPENCER HUTCHINSON of Boston is examining mines in California.

LLEWELLYN HUMPFREYS, who was lately married, is visiting San Francisco.

COURTENAY DE KALB is on his way to Guadalupe y Calvo, in Chihuahua, Mexico.

OSCAR D. CHAMPION has received an appointment at the Sao Bento mine, in Brazil.

EDWARD G. STOIBER is visiting Denver, from Paris, where he now makes his home.

MR. J. TROWBRIDGE BAILEY, of New York, has been examining mines in South Dakota.

W. W. MORSE has charge of the construction of the new smelter at Chihuahua, Mexico.

C. H. MUNRO has returned to Portland from San Francisco and will soon go to Alaska.

A. C. RISER has succeeded O. Wiser as superintendent Annie Laurie mill at Kimberly, Utah.

NOBLE C. BANKS is erecting a 120-stamp mill at the Cerro Prieto mines in Sonora, Mexico.

ARTHUR M. DAVIS, manager Capuzaya Mining Company, has returned to Parral, Mexico.

JAMES STEVENS, superintendent Silver King mill at Park City, Utah, is visiting California.

E. H. MESSITER, on his return from France, has left New York to proceed to Cananea, Mexico.

ELMER AXFORD is superintendent Bullion Gold Mining & Milling Company at Lead, South Dakota.

BENNETT OPIE has been re-elected superintendent Pennsylvania mine at Grass Valley, California.

WILLIAM ENGELS is in charge of the Engels Copper Mining Company in Plumas county, California.

J. H. TIBBITTS has resigned as superintendent Head-Waters mine and is now at Redding, California.

STANLEY H. PEARCE is engineer with the Black Mountain Mining Company, at Magdalena, Sonora.

ROBERT T. WHITE is erecting the new smelter at the Balaklala copper mine, in Shasta county, California.

ALGERNON DEL MAR is superintendent for the Edel Mining Company at Enterprise, in Butte county, California.

A. E. S. PRICE has been appointed superintendent Dardanelles Mining & Milling Company at Searchlight, Nevada.

JAMES A. RICKARD has left the Peyrebrune mines and is now manager of the Mines de l'Aude, at Lastours, in France.

B. A. LASELLE has left New York, via Panama, to examine and report upon placer mines in Sandia district, eastern Peru.

P. O. WELS has resigned from the Lake Superior Smelting Company to go with the International Ore Treating Company.

R. T. BAYLISS AND PHILIP L. FOSTER, chairman and consulting engineer, respectively, of the Exploration Company, are in New York.

JAMES M. DIKEMAN, formerly with the Liberty Bell Company of Telluride, has just returned from South Africa and will settle in California.

O. WISER has resigned as superintendent Annie Laurie mill at Kimberly, Utah, to look after his interests in the Gold Butte district in Nevada.

DUNCAN MCVICHIE, of Salt Lake City, consulting engineer Balaklala Consolidated Copper Company, is visiting the mines at Kennett, Shasta county, California.

H. N. EDMONDSON, formerly assistant manager Dolores Mining Company, has taken the position of superintendent of the Parral Corporation, which owns the San Patricio mine, near Parral, Chihuahua, Mexico. Claude Easley, late of the United Parral Mines Company, will be his assistant.

Obituary.

JOSEPH R. FOCHT, superintendent of construction of the new concentrating mill of the Utah Copper Co., died of heart trouble, January 5, at Salt Lake City, age 32.

METALS.

SILVER.—Per oz., Troy: London, 30½d (standard ounce, 925 fine); New York, (By Wire), bar silver, 65⅝c, refined (1000 fine); San Francisco, 65½c; Mexican dollars, 51@53c, San Francisco; 50½c, New York.

COPPER.—New York (by wire), Lake, 18½ @ 19c; Electrolytic, 18⅝@18¾c; Casting, 18@18⅝c. per pound. Mill copper plates, $21.00; bars, 21@24c. London: £79 2s 6d spot per ton.

LEAD.—New York (by wire), $5.60; San Francisco, $5.15, carload lots; 5¼c 1000 to 4000 lbs.; pipe 7½@8⅝c; sheet, 6¾@8¼c; bar 6¾c. London: £17 ℔ long ton.

SPELTER.—New York (by wire), $6.65; London, £29 5s ℔ ton; San Francisco, ton lots, 7c; 100-lb lots, 7¾c.

TIN.—New York, pig, $36.55@36.75; bar tin, ℔ lb., 40c.; pig, 38c. London, £185 10s.

PLATINUM.—San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $20.50 ℔ Troy oz. Platinum ware, 75@$1.00 ℔ gram.

QUICKSILVER.—New York, $40.00@$40.50, large lots; London, £7 5s 0d; San Francisco, local, $37.50@39.00 ℔ flask of 75 lbs.

BABBITT METAL.—San Francisco, No. 1, 10½c; No. 2, 8c; No. 3, 7½c; extra, 17½c; genuine, 32½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 23.50c; San Francisco, Plumbers', 100-lb. lots 19.75c.

NICKEL.—New York, 55@60c ℔ lb.; ton lots, 40@47c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb, .04c.

ALUMINUM.—No. 1, 99%, small lots, 37c ℔ lb.; 100 lbs.. 35c; 1000 lbs. 34c; ton lots and over, 33c, Pittsburg. No, 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $18.35@18.85; gray forge, $14.60; San Francisco, bar, 3½c ℔ lb., 3¾c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $26.00@$27.00; open hearth billets, $27.00@$28.00; San Francisco, bar, 7c to 13c ℔ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 7¾c; less than 500 lbs., per lb., 8c; in 25-lb. tin pails, ¼c ℔ lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, ¼c per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 7¼c; do. in kegs, 8c.

LIME.—Santa Cruz, $1.35 country, $1.25 city ℔ bbl.

CEMENT.—Imported, $3.00@4.00 ℔ bbl.; California, carload lots, $1.80 f. o. b. at works; small lots, $2.10 ℔ bbl. in sacks, 4 sacks to bbl., 5c for each sack returned.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00;shingles, $2.50 for No. 1, and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d, Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4d and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 11½c; Hallett's, 12½c; San Francisco, 1000-lb. lots, 14c; 300@500-lbs. 12c; 100-lb. lots, 13c.

BONE ASH.—Extra No. 1, 5@6c ℔ lb; No. 1, 4@5c.

BORAX.—Concentrated, 7@8c ℔ lb; powdered, 9@10c; fused, 25@30c; crystal, 7c.

CANDLES.—Standard Oil Co.—Electric light, 16 oz., 11c; 14 oz., 9¾c; 12 oz., 8½c; 14 oz., 7¾c; Hotel, 12 oz., 9c; Granite (mining), 16 oz., 11½@11¾c; 14 oz., 10@10½c; 12 oz., 9½@9¾c; 10 oz., 8½c; Paraffines, White, 1s, 2s, 4s, 6s, 10½c; 12s, 11c; colored, 1c higher; Radiant Paraffines, 4s, 6s, 14 oz., 9½@9¾c; 10 oz., 7¾c.

CAPS.—3x, $5.50@6 per 1000; 4x, $6.50@7; 5x, $8@8.50; Lion, $9@9.50, in lots not less than 1000.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3½c ℔ lb.; caustic soda, in drums, 3@3½c ℔ lb.; Cal. s. soda, bbls., $1.10@1.20 ℔ 100 lbs.; sks., 90c@$1.00; chlorate of potash, 12@13c; nitrate of potash, 6½@7c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2¼@2½c; flour sulphur, French, 2¾@—c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 5¼@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66% B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

COAL.—San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.50; Southfield, $8.00. Cargo lot, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $11.50 per ton in bulk, $13.00 in sacks; Sunnyside, $8.50, long ton.

OILS.—Linseed, boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 57c; Lucol oil, boiled, bbl., 48c; cs., 53c; raw-bbl., 46c; cs., 51c. Kerosene—Pearl, per gal., 17½c; Astral, 17½c; Star, 17½c; Extra Star, 20½c; Eocene, 19½c; Elaine, 26c; Water White, in bulk, 11c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 14½c, do., cs., 21c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 12½c; do., in cs., 19c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 68c; Bleached, do., 68@73c; Whale Oil, cs., 52@67c.

BISMUTH.—Subnitrate, ℔ lb., $2.10.

CHROMIUM.—90% and over, ℔ lb., 80c.

FIRE BRICK.—Domestic, carloads ℔ 1000, f. o. b., factory square, $25.00; soap and split, $22.50; arch and wedge, $27.50; skewback, $30.00; circle, $32.00.

FIRE CLAY.—Domestic, ℔ ton 2000 lbs. in 125-lb. bags double, and dry ground, f. o. b., factory, $8.50.

FUSE.—Triple tape, $4.00 per 1000 feet; double tape, $3.55; single tape, $3.10; Hemp, $2.85; Cement No. 2, $3.10; Cement No. 1, $2.75, in lots of 3000 and up.

LITHARGE.—Pure, in 25-lb. bags, 9½@10½c ℔ lb.

MAGNESIUM.—Pure, N. Y., $1.60.

MANGANESE.—Black oxide, ℔ lb., 2¾@4c.

MERCURY.—Bichloride, ℔ lb., 77c.

MOLYBDENUM.—Best, $2.75 ℔ lb.

PHOSPHORUS.—American, ℔ lb., 70c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitroglycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1**, 50%, carload lots, 11½c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2**, 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

RED LEAD.—500 lbs. and over at one purchase, ℔ lb. 7½c; less than 500 lbs., 7¾c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 54c

SODIUM.—Metal, ℔ lb., $1.

TUNGSTEN.—Best, ℔ lb., $1.20.

URANIUM.—Oxide, ℔ lb., $3.40.

Books Received.

'The Production of Aluminum and Its Industrial Use,' by Adolphe Minet. Translated with additions, by Leonard Waldo. The book consists of three parts: Part I.—Processes for the Production of Aluminum: A. Chemical Method of Producing Aluminum: *a.* Processes based on the Reduction by Means of Sodium; *b.* Processes which do not Employ Sodium. B. Electro-Chemical Methods of Producing Aluminum: *a.* Electrothermic Processes; *b.* Electrolytic Processes for the Production of Aluminum. Part II.—Aluminum and its Alloys, Methods of Working and Uses: A. The Aluminum Industry. B. Aluminum and its Alloys: *a.* Pure Aluminum; *b.* Heavy Alloys; *c.* Alloys of Medium Density; *d.* Alloys of Various Densities; *e.* Light Alloys. C. Working of Aluminum; Process of Soldering Aluminum; Electroplating Aluminum. D. Uses of Aluminum: *a.* In Commerce and Minor Industry; *b.* In Greater Industry; *c.* In Chemistry and Metallurgy; Aluminothermy, and the Appendix, consisting of supplementary notes by Adolphe Minet, on industrial questions and the theoretical part. It is published by John Wiley & Sons, New York City, and will be sent postpaid by the MINING AND SCIENTIFIC PRESS for $2.50.

Although probably written with no such intent, yet the great result attained by 'The Economics of Mining' is showing the close relation between the operator and the investor and how such relations may best be subserved. The book comprises reprints of a number of articles relative to the cost of mining that have appeared in recent copies of the *Engineering and Mining Journal.* Included are articles dealing with the ethical and financial aspects of the industry. These articles have been written by some of the best known mining engineers of the day and present the results of wide practical experience under varied conditions. The first question that suggests itself to the reviewer is why a number of apparently irrelevant subjects should be abstracted from the files of a technical journal and be printed together in a single book. The favorable answer is found in the unifying and correlative work of the editor, T. A. Rickard. As the topographer unites the detail maps of a vast region by his triangulations, so has Mr. Rickard determined the bearings of the various details to the field of successful mine management. The true place of each with reference to the science that treats of the development of mining resources is shown by able editorial comments. The main subjects discussed are the valuation of mines, including a clear-cut statement of the methods of mine finance, costs of mining and milling in all parts of the world, the ratio of equipment to ore reserves, methods of mine accounts, and details of special methods in various localities. Each is discussed by a specialist and presents the results of his own experience. Mine managers will find practical pointers in the chapters on mine accounts. Stockholders and investors will be especially interested in the portrayals of methods of mine valuation and flotation. For the superintendent it gives comparative costs and methods, for the investor it gives an unequalled statement of the elements of mine valuation, and for both it emphasizes the close relationship that each should bear to the other in effecting profitable mining. It is a book which should find a place in the library of every man interested in the development of our mineral wealth. The book will be sent postpaid by the MINING AND SCIENTIFIC PRESS for $2.

Trade Treatises.

Geo. W. Pennington Sons, INC., of San Francisco, have issued a very attractive calendar for 1906.

Bulletin No. 62, issued by the Crocker-Wheeler Co., covers the field of "Electric Hoisting Machinery."

Bulletin No. 1,048 of the electrical department of the Allis-Chalmers Company of Cincinnati, Ohio, illustrates and describes the construction of Bullock alternating current generators of engine and fly-wheel types with revolving field.

The Stromberg-Carlson Telephone Manufacturing Company, of Rochester, N. Y., and Chicago, interestingly portray the details and advantages of private branch telephone exchanges in Bulletin No. 14, which contains material of interest to managers of large mines in need of more centralized intercommunication.

Commercial Paragraphs.

THE Rapid-Economy Stamp Mill Co. report sale of three-stamp battery to L. A. Hughes of Durango for immediate shipment.

THE Ingersoll-Rand Co. announce that they have secured exclusive control of the product of the Imperial Pneumatic Tool Co. The line of Imperial tools includes pneumatic hammers, drills, riveters, reamers, hoists and plug drills.

THE Colorado Iron Works Co. reports the sale of three large sets of Humphrey rolls to the American Smelter Securities Co. for their Garfield plant. The same company is building for the Hall Mining & Smelting Co., Nelson, B. C., the equipment for a complete crushing and sampling plant in which six impact screens will be installed, an automatic bedding system consisting of conveyors with reversing trippers, an automatic mixing and distributing system for crushed material for the lead-converting plant and a car-haul system, requiring 17 cars and 24 turntables.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market street, San Francisco, has official reports of the following United States patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING DECEMBER 26, 1905.

808,195.—BARREL TAP - M. J. Chaplin, Seattle, Wash.
808,231.—SWITCH—J. M. Comer, Seattle, Wash.
808,198.—VALVE—M. O. Dolson, Los Angeles, Cal.
808,199.—SWIVEL—E. Double, Los Angeles, Cal.
808,521.—WASHING MACHINE—Dyke & Alderman, Walla Walla, Wash.
808,525.—WATER HEATER—J. P. Erle, Los Angeles, Cal.
808,527.—LOADING APPARATUS—J. M. Ferrish, Tacoma, Wash.
808,529.—OIL BURNER—B. O. P. Foss, San Jose, Cal.
808,356.—TUBE MACHINE—N. Foster, Tacoma, Wash.
808,444.—HOSE CLAMP—Gergersen & Parr, Seattle, Wash.
808,235.—PIPE PERFORATOR—E. R. Graham, Coalinga, Cal
808,361.—ROASTING ORES—H. Haas, San Francisco.
808,201.—SHOW WINDOW—G. T. Hadley, San Francisco.
808,369.—BED BOTTOM—J. Hoey, San Francisco.
808,202.—GLASS CARRIER—J. Hunter, Los Angeles, Cal.
808,376.—DOOR LATCH—J. S. Johnson, San Francisco
808,286.—STEAM GENERATOR—W. L. Jones, San Francisco.
808,242.—WINDOW SHADE—E. C. Jordan, Los Angeles, Cal.
808,608.—PUMP—E. E. Kretzschimar, Alameda, Cal.
808,387.—PHOTO APPARATUS—C. J. Kurtz, Salem, Or.
808,460.—INSECT TRAP—G. Laube, Santa Monica, Cal.
808,289.—CLUTCH—A. Lee, Bellingham, Wash.
808,243.—BORING MACHINE—J. Lund, San Francisco.
808,464.—FRUIT PITTER—K. T. Lynn, Fresno, Cal.
808,469.—PENHOLDER—F. B. McDonald, El Dorado, Cal.
808,294.—AWNING BOX—E. T. Meakin, San Francisco.
808,397.—MUST DISTRIBUTOR—E. T. Meakin, San Francisco.
808,250.—WRENCH—B. F. Meadrow, Anacortes, Wash.
808,109.—TROLLEY—Osburn & Coad, Pasadena, Cal.
808,216.—CAN FILLER—D. W. Rathbone, Seattle, Wash.
808,260.—KNIFE SHARPENER—J. A. Stansbury, Los Angeles, Cal.
808,132.—PILE DRIVER—A. E. Williams, Douglas, A. T.
37,759.—DESIGN—K. Gakushiji, San Francisco.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS United States and Foreign Patent Agency the following are worthy of special mention:

DOOR-LATCH ATTACHMENTS.—No. 808,376. December 26,1905. Joseph S Johnson, San Francisco, Cal. This invention relates to an announcing attachment for the latches of doors. It consists of a sounder and means whereby the attention of the inmates of a room will be attracted by the turning of a knob to open the door. It may be so constructed as to make one or a plurality of strokes during the turning of the knob in each direction. If it is desired to disengage the sounding mechanism, it is effected by means of a pivoted arm which is turnable, so that it will press the end of the arm downward sufficiently to carry it out of the line of movement. The knob can then be turned and the door opened without alarm. The device comprises the combination of a latch bolt provided with teeth, a bell or sounder, and a pivoted hammer-operator, of a rocking arm having one portion provided with a line of teeth to engage the hammer-operator and having a hub portion provided with teeth to engage those on the bolt whereby the hammer-operator is positively moved by both the hammer-operator on the bolt whereby the hammer-operator is positively moved by both the forward and rearward movement of the bolt

MEASURING SPOONS.—No. 808,967. Jan. 2, 1906 William H. Arrowsmith, Oakland, Cal. This invention relates to a device for conveniently measuring materials, and especially such materials as are used in pulverized or powdered form. It is the object of this invention to provide a measuring device which is adjustable and will be sufficiently accurate for the required use. The device consists of a tube having an extension cut down to approximately half the diameter of the tube, said extension having a hemispherical closed end, a plug slidable in the tube and having an extension cut down to correspond with the shape of the tube extension, a slot in the tube having transverse notches, and a spring-latch carried by the plug and adapted to engage with the notches of the tube.

EDITORIAL.

THE mines of the Rand made a record output in the last month of 1905. The Transvaal Chamber of Mines reports the yield as 431,594 fine ounces, worth $8,921,048. For the year the production was $101,850,000, an increase of $24,000,000 over 1904. Further increase is expected during the current year.

OUR distinguished contemporary, *The Iron Age*, celebrates its semi-centennial with the issue just to hand from New York. We offer hearty congratulations. In its high character, continuity of purpose and successful enterprise, *The Iron Age* has set an example in trade journalism such as its contemporaries can well afford to imitate. We trust that Mr. Richard Williams and Mr. Charles Kirchhoff may long continue to direct so useful an organ of industrial knowledge.

SAN FRANCISCO foundrymen are doing better for their customers than is to be expected in these days of industrial combinations; they are still selling castings at the rate demanded before pig iron and coke rose to their present high prices. Other industries, especially where consolidated into trusts, have raised the price of manufactured articles in accordance with the advanced cost of the raw material, and beyond that; but the foundrymen have omitted to do so, not from any altruistic motive, but because the competition was too severe to permit departure from an established rate. The brass foundries put up prices long ago, but the dealers in iron have kept apart, each for himself, and stuck to the old prices, despite the fact that pig iron has gone up $7 per ton. We do not make these remarks to incite the machinery people to higher charges, but to advise our mining friends, who are likely to need castings in the near future, to get them before the market goes against them.

The State Mining Bureau.

California has reason to be proud of the work done by her State department of mines, the Mining Bureau. As a rule the official connection between the several Western States and the mining industry to which they owe their existence, takes the form of a semi-political office endowed with a salary large enough to attract the office-seeker, yet insufficient to afford a livelihood to a capable professional man. In consequence, the mining bureaus and geological surveys of most of the States are so badly financed as to be unable to do serious work; either they are managed by second-rate politicians or else they are adorned by earnest scientific men who are vainly endeavoring to do something with nothing. As an office for the authoritative collection of statistical information and as the publishing medium for a number of useful treatises, the Mining Bureau of California is well known wherever mining men congregate. It is worthy of the support of the people of the State, and more especially of those who desire to promote the best interests of the industry that made California a great commonwealth. It needs active support, if the signs are to be read rightly. We are now in January, 1906, and yet the appointment to the position of State Mineralogist has not been made by the Governor. It is nearly a year overdue. When the Executive chose the trustees of the Mining Bureau, in November, there was hope that the chief post would shortly receive his effective attention. The trustees were admirably selected, they are men thoroughly known to the mining community and experienced in such matters as appertain to the Bureau. Mr. Lewis E. Aubury, who has served one term of four years, remains State Mineralogist until his successor is named. It is fair neither to the present occupant of the post nor to his eventual successor to postpone the appointment so long. If Mr. Aubury is the man, let him receive proper confirmation, so that he may attend to his duties with a good heart; if he is not to be his own successor, let this other begin his duties as soon as possible. The case reminds us of the present anomalous condition of the Canadian Geological Survey. When George M. Dawson died, Dr. Robert Bell succeeded temporarily to the duties of director. This happened five years ago, but Dr. Bell remains "acting director." A grave injustice has been done to him and to the Survey. The energies of the chief and of his subordinates have been weakened by the cliques formed to support one or other candidate for the position, the actual director has had his authority undermined by the uncertainty of his tenure of office and the Survey as a body has lacked the solidarity belonging to an organization having its properly appointed head. In other words, it is a mistake, either at Ottawa or at Sacramento, to sacrifice work of great usefulness to the exigencies of a political lobby.

The Mining Bureau gets scant recognition from the State. At one time the appropriation was as much as $50,000 per annum. Nowadays it is only $17,000. After paying such fixed charges as the salaries of the mineralogist, the librarian, the chemist, together with laboratory and office expenses, etc., there is about $250 per month left over for actual fieldwork. This, the most important of its functions, is sadly neglected; the best products of the Bureau have been bulletins based on fieldwork, such as Preston on gold-milling practice, Hans Behr on mine drainage, Prutzman on petroleum, Storms on mine timbering, Kunz on precious stones, Fairbanks on the geology of the Mother Lode, McGillivray and Doolittle on gold dredging, and other publications, the editions of which have usually been exhausted all too soon. A region that has a mineral output valued at 45,000,000 dollars per annum ought to be able to set aside something better than $17,000 for the office that is designed to promote the exploitation of resources only half-known. The State Mineralogist gets $3,000 per annum—quite enough for a place-hunting politician and not nearly enough for a man who has equipped himself, by education and experience, for such a post. Of course, the professional man who accepts office under the State cannot expect to receive pay equal to that of a successful practitioner; the holding of an honorable office confers a distinction and permits of a manner of life which should be more agreeable than the brilliant uncertainties of a professional career. On the other hand, it is high time to recognize the fact that if the State pays a mere fraction of the salaries that corporations willingly accord, it must either get men poorly qualified or else wink at queer doings. Occasionally a man with a self-supporting income takes office for the honor of it; that is ideal, but infrequent. Applying this argument to the office of State Mineralogist, we consider that, in this day and generation, things being as they are, $5,000 is a minimum salary for such a post, if it is to be filled by a capable man, willing to attend solely to the duties of the office. We trust sincerely that any idea of attempting to ride two horses, to serve the State while promoting mines, continuing private engineering practice, running a newspaper, or any other shifty compromise will not be entertained. That way lie inefficiency and scandal. We have expressed ourselves frankly, having no personal interest in the appointment or in the political undercurrents that may move it; although we believe that our views will be endorsed by those who have at heart the best interests of mining in California.

A Mare's Nest.

We have been taguht to regard the statistical reports of the Geological Survey as gospel, hence our grief to find that the mining of tin in Indiana has made the fortunes of enterprising individuals living in the hoosier State without any record appearing in the statistical yearbook published at Washington by Dr. David T. Day and his accomplished aides. In the *World's Work* it is related that a junior officer of the Pennsylvania Railroad visited Wales and obtained a knowledge of tin; he became fascinated with the subject; "he talked tin, he thought tin, he dreamed of tin." On his return he built (so it is said) a tin mill and proceeded to exhibit the manner in which it is possible, at short notice, to make an "honest fortune." Of course, we had read somewhere that "pig tin has not been produced in the United States since the calendar year 1893," but this turns out to be one of those conservative statements due to ignorance of what is really going on within our vast mining regions.

The fact is, popular magazines make curious errors.

Tin mining is almost extinguished—but not quite—in the United States. Gaffney in South Carolina and Lost River in Alaska produced tin last year; so also did certain young mines of Cape York and in South Dakota. But tin is not a product of Indiana. The writer of the article referred to must have floundered in his terms, confusing pig tin with tin plates—the plates which are manufactured in Indiana from American iron and from tin that comes either from Cornwall or the Malay peninsula. The tin of Indiana must share the fate of the gold in sea water and the brass in Maine, companies having been organized to exploit both these resources, natural and unnatural, respectively. The gold in sea water is like the heat in moonshine—it is there, but the percentage is below the commercial limit. As to brass in Maine, that was mentioned in a recent prospectus of a company anxious not to omit any chance of expanding its operations. Of course, there is brass in Maine, there is brass in every country, even in Gaul. But the brass industry flourishes best in Connecticut, where manufacturers are content to make an alloy of copper and zinc. Of copper and zinc there is a plenty, but of tin there is a great scarcity in North America. The gentleman from Indiana who "dreamed of tin" may have been a prophet unwittingly, and the day may yet come when the tin-plate manufacturer of his State will make a real "honest fortune" from an industry based upon the application of Alaskan tin to the iron of Minnesota.

Ore Deposition and Deep Mining.

Waldemar Lindgren has won such a reputation as an authority on the geology of ore deposits that his article, in this issue, on the relation of this subject to deep mining, is sure to prove interesting to many readers. His verdict is, in the main, favorable to the persistence of ore, especially in California. Mining operations have emphasized such a view, and if we differ from him it is only in regard to certain generalizations which it seems to us that mining in its world-wide aspect does not endorse. The intersection of a diorite, granite, or any other rock known by its structure to have been consolidated at a great depth, does not prove that the vein intersecting it was also formed at a great depth. It may have been formed after erosion had brought the deep-seated rock in close touch with the surface. The main question is the amount of that erosion before the vein was formed and the amount that has taken place since that time. In the absence of evidence proving geological antiquity, experience has taught that it is safest to assume the formation of the ore to have been, geologically speaking, of comparatively late date. Most of the ore deposits valuable to man represent the last phase in a process of concentration, which began after the vein-fracture or lode-channel was formed; but it was a process which was resumed whenever thermal activity prevailed, and it must have been most effective when the conditions favoring precipitation were at their best, concurrently with a generous circulation of mineral-bearing waters. Such conditions, favorable to deposition, are usually found in the approach to surface, because in that vicinity the chemical and the physical factors induce precipitation, just as with increasing depth there is greater tendency to solution.

As to the amount of vein removed by erosion in such mining regions as Victoria and California, that is a nice question. Mr. Lindgren assumes a thickness of 3,000 feet as having been scored away since the veins were originally formed. This is not as much as many less careful writers have vaguely assumed. One becomes cautious in making estimates when it is seen how glacial striæ made ten thousand years ago survive to this day. If a groove cut an inch deep in granite is not wiped out during ten thousand years, how long will it require to remove a depth of half a mile of granite? Time sufficient to produce local enrichments in a vein or concentration of ore in a lode is conceivable without asking for the period which must elapse while anything from half a mile to a mile of rock is gnawed away by the teeth of erosion. As far as we know from actual mining, a total depth of 5,000 feet for any vein that carries ore is expecting a good deal. Quartz veins without ore undoubtedly go deeper, but economic geology is not interested in silica, there being enough of it for our immediate wants at the surface itself.

The Rise in Anaconda.

The recent meteoric rise in the market value of Anaconda shares illustrates methods that were more common in the barbaric stage of the mining industry than they are today among those who regard it as a legitimate business. Early in November Anaconda sold at 116; at the end of that month it stood at 155; on December 16 it reached 196; fourteen days later 295, and on January 2 it attained a maximum of 298—a total rise of 182 points in two months. Since then, of course, it has reacted, down to 236 and up to 265. Our readers will recall similar fluctuations. In 1901, with copper at 17 cents, the company earned a surplus of $5,571,816, equal to 18 per cent on its capital stock of $30,000,000. In April of that year shares sold at 217. Copper fell to 13 cents and the quotation for Anaconda shares fell with it to 113. In 1902, copper sold at 12 cents, the earnings of the company were only $1,601,201, and the shares fell to 58. And so on. In their annual report, issued last April, the directors of the Amalgamated Copper Company, which now controls Anaconda, stated that a fluctuation in the price of copper from 11.70 to 16.50 cents per pound meant a difference of $9,700,000 in their net earnings, or over 6 per cent on the $155,000,000 which represents the capital stock of the Amalgamated Copper Company.

The recent rise in the price of Anaconda began when the price of the metal copper commenced to climb, but it was stimulated largely by the rumor of an increased dividend, to be declared next April. This is a good example of the manner in which Wall Street discounts the effect of coming events. On the top of these expectations there came "unofficial" talk of a big discovery in the mine. These unofficial statements were freely circulated, they were wholly irresponsible, but quite effective for their purpose—of booming the stock market. It was said that there had been struck at the deeper levels a new lode forty-five feet wide, assaying 15 per cent, as compared to the ordinary average of Anaconda ore, namely, 4 per cent. No official statement has been made, no proper information has been vouchsafed the shareholders, everything is kept as mysterious as in the times of Mackay and Fair on the Comstock. The business is managed for the benefit of insiders, just as thoroughly as in the old days when Virginia City astonished the world with her output of silver and incidentally demoralized mining for a whole generation.

In 1871 Mackay and Fair secured the Con. Virginia mine for $26,000. In 1873, the 108,000 shares sold for $45. Shortly afterward rumors of the great bonanza leaked out. In November, 1874, the shares stood at 115; a month later they jumped to 610, and in January, 1875, they were quoted at 700. The companion mine, the California, had the same story, the shares rising from 37 to 780. The market valuation of the consolidated mines rose from $40,000 in 1869 to $160,000,000 in 1875. The game was as well played as that of a faro dealer or a modern buccaneer from the wilds of Manhattan. Within five years the group of bonanza mines on the Comstock dwindled in market value from $393,000,000 to $7,000,000. In the meanwhile whole fortunes had changed hands, the star players had made a colossal clean-up and a few thousand of the ordinary sort of people had been hopelessly ruined. In any event, of course, there would have been a big rise and the chance to gamble on a large scale; but the tactics of the "big four," Mackay, Fair, Flood and O'Brien, were intended to make the most of all possible exaggeration, and the market value of the mines was inflated to three or four times the amount warranted by the facts.

All such manipulation is hurtful to mining. Some one has to pay the difference between the actual investment value of the stock and the fictitious price to which it is boosted. The desire of all those who have at heart the best interests of the industry must ever be that money shall be made as much as possible by actual mining, milling and smelting operations and as little as possible by playing upon the gullibility of the simple, the greed of the covetous or the good faith of the inexperienced.

By the Way.

In his presidential address, before the South African meeting of the British Association for the Advancement of Science, Professor George Darwin, among other things, said:

Bartholomeu Diaz, the discoverer of the Cape of Storms, spent 16 months on his voyage, and the little flotilla of Vasco da Gama, sailing from Lisbon on July 8, 1497, only reached the Cape in the middle of November. These bold men, sailing in their puny fishing-smacks to lands unknown, met the perils of the sea and the attacks of savages with equal courage. How great was the danger of such a voyage may be gathered from the fact that less than half the men who sailed with da Gama lived to return to Lisbon. Four hundred and eight years have passed since that voyage, and a ship of 13,000 tons has just brought us here, in safety and luxury, in but little more than a fortnight.

I am told that in the United States the phrase "I want to know" has lost the simple meaning implied by the words, and has become a mere exclamation of surprise. Such a conventional expression could hardly have gained currency except among a people who aspire to knowledge. The dominance of the European race in America, Australasia and South Africa has no doubt arisen from many causes, but among these perhaps the chief one is that not only do "we want to know," but also that we are determined to find out. And now within the last quarter of a century we have welcomed into the ranks of those who 'want to know' an oriental race, which has already proved itself strong in the peaceful arts of knowledge. To us living men, who scarcely pass a year of our lives without witnessing some new marvel of discovery or invention, the rate at which the development of knowledge proceeds is truly astonishing; but from a wider point of view the scale of time is relatively unimportant, for the universe is leisurely in its procedure. Whether the changes which we witness be fast or slow, they form a part of a long sequence of events which begin in some past of immeasurable remoteness and tend to some end which we cannot foresee.

The discrimination of the truth from among discordant records is frequently a work demanding the highest qualities of judgment; yet when this end is attained it remains for the historian to convert the arid skeleton of facts into a living whole by clothing it with the flesh of human motives and impulses. For this part of his task he needs much of that power of entering into the spirit of other men's lives which goes to the making of a poet. Thus the historian should possess not only the patience of the man of science in the analysis of facts, but also the imagination of the poet to grasp what the facts have meant.

The test of a scientific theory lies in the number of facts which it groups into a connected whole; it ought beside to be fruitful in pointing the way to the discovery and co-ordination of new and previously unsuspected facts. Thus a good theory is in effect a cyclopedia of knowledge, susceptible of indefinite extension by the addition of supplementary volumes.

The fundamental idea in the theory of natural selection is the persistence of those types of life which are adapted to their surrounding conditions, and the elimination by extermination of ill-adapted types. The struggle for life among forms possessing a greater or less degree of adaptation to slowly varying conditions is held to explain the gradual transmutation of species.

The complex inter-actions of man with man in a community are usually described by such comprehensive terms as the State, the Commonwealth, or the Government. Various States differ widely in their constitution and in the degree of the complexity of their organization, and we classify them by various general terms, such as autocracy, aristocracy or democracy, which express somewhat loosely their leading characteristics But, for the purpose of showing the analogy with physics, we need terms of wider import than those habitually used in politics. All forms of the State imply inter-relationship in the actions of men, and action implies movement.

In the world of life the naturalist describes those forms which persist as species; similarly the physicist speaks of stable configurations or modes of motion of matter; and the politician speaks of States. The idea at the base of these conceptions is that of stability, or the power of resisting disintegration. In other words, the degree of persistence or permanence of a species, of a configuration of matter or of a State depends on the perfection of its adaptation to its surrounding conditions.

The evanescent type of animal life has often been preserved for us, fossilized in geological strata; the evanescent form of Government is preserved in written records or in the customs of savage tribes; but the physicist has to pursue has investigations without such useful hints as to the past.

The fascinating idea that matter of all kinds has a common substratum is of remote antiquity. In the middle ages the alchemists, inspired by this idea, conceived the possibility of transforming the baser metals into gold. The sole difficulty seemed to them the discovery of an appropriate series of chemical operations. We now know that they were always indefinitely far from the goal of their search.

CONCENTRATES.

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and to give information dealing with the practice of mining, milling and smelting.

THE phosphates of the alkaline earths are insoluble in potassa, and soluble in acetic acid.

♣♣♣♣

LITHIA is precipitated from concentrated solutions upon heating by hydric-disodic phosphate.

♣♣♣♣

A MINING LOCATION made on Sunday or a legal holiday is valid. The law makes no exceptions in this regard.

♣♣♣♣

OXIDES are precipitated as sulphides by hydrogen sulphide from their solutions, acidulated by hydrochloric or nitric acid.

♣♣♣♣

IT costs from $3 to $5 per cubic yard to break rock to pass a 2-in. ring by means of hand hammers, where wages are $2 per day.

♣♣♣♣

GOLD-BEARING VEINS are not commonly found in rhyolite, though the occurrences at Goldfield, Nev., and vicinity are an important exception.

♣♣♣♣

WHERE gold ores are crushed in cyanide solutions, amalgamation on outside plates is usually unsatisfactory for the reason that the cyanide renders the plates hard and unfit for the amalgamation of the gold.

♣♣♣♣

DOLOMITE may be employed as a flux for pyritic ores. Dr. F. R. Carpenter had no other kind of limestone at the Deadwood & Delaware smelter, and the dolomite was found to fulfill every requirement.

♣♣♣♣

IT is generally more economical to employ a large rock-breaker of great capacity that will crush the ore in a short time than to use one which must be kept constantly in operation in order to keep the mill supplied with ore.

♣♣♣♣

OIL WELLS known as 'gushers,' which start with a large flow, are usually less enduring than pumping wells; in fact, are often short-lived, but their aggregate production may equal that of a pumping well with a low daily output.

THE Ziervogel process is based upon the fact that silver in copper matte is converted into silver sulphate by means of sulphuric anhydride evolved from iron and copper sulphides present in the matte. The process consists in roasting the sulphides in excess of air so that they become partly sulphates, which are then heated sufficiently to decompose the sulphates of iron and most of the sulphates of copper, while the silver remains sulphatized and may be dissolved out with boiling water and precipitated later on sheet copper.

♣♣♣♣

THE first gold mining done in the United States was probably in Georgia, as early as 1826. The discovery of gold-bearing quartz is said to have been made by two English peddlers, who found 'specimen' rock on land now owned by the Columbia Mining Company in McDuffie county. It is said that a single individual bought up a large tract of land in the gold region at that time; but, having no knowledge of mining and failing in the first attempt, discontinued investigation, and the land has never yet been properly prospected.

♣♣♣♣

WHILE all laccoliths are not known to be associated with ore deposits, yet this form of geological occurrence has come to be regarded as affording possibilities that should be inquired into wherever found. So many valuable mines and extensive mining districts occur, in Colorado, Nevada, South Dakota, Utah and elsewhere, in association with laccolithic intrusions, that it is now considered necessary to investigate the contact of laccolitic rocks with the surrounding sedimentary formations which they intrude. Even in mineral districts, all laccoliths are not associated with ore bodies.

♣♣♣♣

THE cost of hydraulic mining depends wholly upon the conditions under which the work is done. The important factors are character, quantity and condition of the gravel, amount and head of water available for hydraulicking, grade obtainable to render disposition of tailings inexpensive, percentage and size of boulders encountered, ability and experience of the management, and interest on capital invested in property. In California, hydraulicking has been accomplished as low as 4c. per cu. yd., but it is usually as high as 6 to 8c. per cubic yard.

♣♣♣♣

THE secondary enrichment of mineral veins and ore deposits is not equally pronounced in every district. It seems most commonly to occur in connection with copper and lead ore. Pockets (accumulations) of gold in veins and intersecting seams in rocks, such as occur in scores of places in California, are probably the result of secondary enrichment, or localization of mineral deposition. Some veins producing rich bunches or pockets of gold carry little or no gold a short distance away from the rich segregation. Other pocket veins carry a low grade of gold rock in shoots, the same as gold-bearing veins generally, the pockets being incidental.

♣♣♣♣

THE occurrence of manganese dioxide in the superficial portions of veins can usually be attributed to the presence of the sulphide of manganese (alabandite) in greater depth, though the carbonate and silicate may only be found, the sulphide being at either too great a depth or occurring in such small amount as to escape attention. In the Tombstone district of Arizona large quantities of manganese were found in the upper portions of some of the more prominent veins, notably in the Lucky Cuss and Knoxville mines. On the 350 level of the Lucky Cuss was found a large mass of ore rich in alabandite and associated with pyrite and galena.

♣♣♣♣

SOME conclusions have been reached concerning the deposition of ores in veins, which may be generalized as follows: "Ascending hot-spring waters, if metalliferous, may deposit different ores with a certain order of vertical distribution. Ascending hot alkaline waters passing through brecciated zones, or crushed and re-opened veins containing pyrite, re-act with the iron sulphide, and zinc, lead, copper and silver, if present, are precipitated as sulphide. Ascending hot acid waters may leach the lower levels of re-opened veins, and carrying the minerals to higher levels deposit gold, silver and copper upon cooling, in the upper portion of the vein.

♣♣♣♣

PRECIOUS opals occur throughout the world wherever found, in volcanic rocks, usually trachyte. The play of iridescent colors is due to internal fractures in the mineral and the consequent interference of light rays. Ordinary opal and semi-opal occurs in various eruptive ks and in veins, also in tuffs. This variety does not sub the play of colors so much prized in the so-called that a Some opals lose their brilliant display of that ar continued exposure, but in some varieties this that are mporarily restored by immersing for a time in that mu When the stone again grows dim, it is against d in oil. ♣♣♣♣

THEORETICALLY, the quantity of ore which may be crushed by rolls is proportional to the superficial surface passing per minute. A set of rolls known to crush a certain quantity of ore at a stated speed would then be calculated to crush double this amount if the peripheral speed be doubled. In practice, however, this is known to be a fallacy, for rolls running at very high speed on some ores give lower capacity than that obtained at a proper speed. When running at very high speed the rolls cause hard rocks to rebound, interfering with the feed and reducing the capacity of the machine. Tests should be made on various ores with a view to ascertaining the proper speed of the rolls for that particular ore. More important than high speed is the keeping the faces of the rolls true and the roll shafts level, avoiding grooves, and the wearing of the side plates. It is not economy to feed the ore in coarse lumps, even if the rolls will crush them. Rolls are not for rock-breaking purposes, but for pulverizing after the ore has been broken to proper size by the breaker.

♣♣♣♣

BLUESTONE (copper sulphate) is recovered in electrolytic copper process from the electrolyte by first boiling the solution in lead-lined tanks with cement copper, in the presence of steam and air, for the purpose of neutralizing any free acid present and to increase the percentage of copper present to the amount desired. It is then conveyed to the tanks, where the copper sulphate crystallizes out on strips of lead suspended in the saturated solution. The liquor remaining contains the greater part of the antimony and arsenic which may have been present in the electrolyte and a small amount of copper. The latter is recovered later in other tanks by precipitation on sheets of iron. The copper precipitates in these tanks first, and later the arsenic is thrown down. In some works the mother liquor remaining after recovery of the greater part of the bluestone is concentrated by evaporation, to crystallize out the remainder of the copper sulphate and the arsenious acid. The bluestone is then leached out with an amount of water just sufficient to dissolve it without dissolving the arsenious acid, or iron sulphate. These latter are recovered from the liquor remaining after the last of the copper sulphate has been secured.

♣♣♣♣

THERE is a difference of opinion as to the relative merit of flat and inclined bottoms in mill ore bins. Those who favor the flat bin claim that the rock (either ore or waste) on the bottom protects the bin from wear and tear of the floor, and gives the mill structure steadiness. Those favoring the inclined bottom merely say it saves shoveling. That the flat bin really possesses an advantage is not apparent. If the mill is well constructed the several tons' weight of ore in the flat bin is not required. If the mill is not properly braced the presence of this additional weight in the bin gives it no steadiness, but rather increases the effect of the vibrations imparted to the structure by moving machinery. When ore runs low, and the reserve in the bottom of the flat bin must be drawn upon, shoveling is at once necessary, and the bin cannot be emptied at a cost of less than 15c. per ton for all that is accumulated there—a serious offset to the contemplated economy. In the inclined bin, if the ore supply is sufficiently abundant to keep the crushing machinery supplied, the wear and tear on the bottom of the bin is *nil*, and there is consequently no advantage of further protection of broken ore. Particular care should be taken in all mills to keep the bins constantly dry, for, if subjected to alternations of moisture and dryness, the planks and timbers will quickly rot and a large bill of repairs will have to be charged to mill account.

♣♣♣♣

INTRUSIVE DIKES associated with veins often have an important influence on their value, particularly where the dike is older than the vein. When later, it often appears only as an accompaniment, being found on one side or the other of the vein and sometimes crossing from side to side, and leaving the vein altogether, running parallel with the vein, but several feet distant. Such dikes generally seem to have had no enriching effect upon the vein. A dike older than the vein, however, in many places appears to have had a favorable influence on ore deposition, if not being wholly responsible for it. The quartz or other gangue material of the vein may be independent of the dike rock, or the dike itself may have become silicified and mineral-bearing, in a mining sense. In some places two dikes may be seen side by side, as in the Greek mine in Calaveras county, Cal., where a gold-bearing quartz vein is found accompanied by a light-colored felsitic dike and a dark-green diorite dike. In the Monte Negras district, near Dale, Riverside county, Cal., gold-bearing quartz veins occur in a large diorite formation, unaccompanied by dikes. Other veins in the district are seen at contact of the massive rock and dikes of a later, darker colored diorite, and in still other instances the veins occur wholly within the dark-green aphanitic diorite dikes. Throughout this district, over an area of several square miles, the veins are similar, consisting principally of quartz and carrying iron, lead, copper and zinc sulphides, with gold and silver.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy.

MINING ENGINEERS AND GEOLOGISTS.

The Editor:

Sir—I have read with interest the letter of Mr. Forbes Rickard, under the above caption, in your issue of the 6th inst. I see no good reason for "strained relations" between geologist and mining engineer, or why the gentlemen representing one class should feel superior to the other. The student cannot get his degree as mining engineer without having had liberal instruction in geology, and particularly in that branch of the science known as mining geology. The value of geology in mining is appreciated by every mining engineer, and still the fact remains that mines were *extensively and successfully* operated long prior to the advent of the mining geologist as a prominent factor in mining operations. Some of the greatest mines of the world were discovered, developed, equipped and practically worked out before the modern mining geologist ever saw them, and then he was so slow in expressing an opinion for fear of making a mistake that his theories were of little value. In more recent years, however, the geologist has been somewhat more confident, and has been known on occasion to announce his judgment rather prematurely.

Notwithstanding this, a high valuation is placed on the opinions of those who are recognized as expert in matters geological. This is clearly evidenced in any mining lawsuit where an extensive array of scientific talent is found on either side, giving expression to their pet theories in return for a handsome retainer. The remarkable thing about it is that these men, who are recognized *by their friends* as at the top of the profession, find it so hard to harmonize their theories. If there is really much of importance in the judgment of expert mining geologists, it is strange that these opinions are so much at variance. It must be remembered, however, that these are judgments of things which usually cannot be seen or determined positively—merely theories concerning the origin of veins or deposits, geologic relations, and other uncertainties, and consequently they must be allowed some latitude.

Why the man who has made mining geology a specialty should feel or assume a supercilious disregard for the opinions of the practical mining engineer is not apparent.

In a famous lawsuit a noted geologist testified that the ore deposits of two adjacent mines, separated only by a narrow gulch, had nothing in common and never had had, in fact, were wholly different in genesis, and he attempted to substantiate this statement by pointing to the fact that in one of the mines in question crystals of wulfenite were found, whereas they had never been observed in the other. The geological structure was so simple, and the previous probable connection of the ore bodies on opposite sides of the gulch was so apparent to the veriest novice in geological science, that those who heard could not but believe that in all probability this remarkable opinion represented a large fee.

The mining engineer is brought into daily contact with material matters. He deals with costs and results, and naturally drifts away from purely scientific considerations. Should his ore-shoot pinch out or the orebody otherwise disappear, he usually wastes little time in theorizing on possibilities, but at once sinks his shaft and inaugurates a new campaign of investigation and development. Theories are all very well when the mine is in bonanza and paying handsomely, but when conditions change for the worse it is generally the practical engineer and not the scientific geologist who is wanted. But there are important exceptions. In the history of some mines a time arrives when the practical miner comes up against a solid 'dead wall,' and he is at a loss to know which way to turn. A notable instance was that in the once famous Emma mine, in Little Cottonwood canyon, in Utah. The great mass of rich lead-silver ore which had attracted the attention of the entire mining world, suddenly terminated against a face of barren limestone; and only a few months after the superintendent had publicly announced with unmistakable pride that the great orebody was "practicably inexhaustible, and the removal of a thousand tons per day made little impression on it," the mine was worked out. Limestone formed the hanging wall, limestone lay beneath the orebody, and now limestone "stared them in the face" in the stope. A mining geologist came to the rescue, and after careful examination of the limestone surrounding the great cavern, which had once been a mass of ore, determined that the limestone in the face was younger than that in the foot-wall of the orebody, and consequently there had been a displacement, the line of fault cutting off the orebody. He ventured the opinion that the continuation of the ore would be found lower down, which proved to be correct.

Were a case similar to this to arise to-day, the probability is that there would be no stoppage of mining, or, at least, no more than a temporary cessation of stoping, for any mining engineer would be equal to so simple an emergency.

The mining geologists have done a great work at Leadville, Colorado, after the necessary exposures had been made under direction of mining engineers, but in the development and exploitation of these famous mines, mechanical problems have been met and solved "time and again" by mining engineers—problems which would have worried the geologist far more than any geological disturbance worries the mining engineer.

Surely, in the broad field of economic and scientific mining, there is a place for both the mining geologist and mining engineer. Each, if he conscientiously discharges the duties of his chosen branch of the profession, must win success and the justly earned respect of his peers.

W. H. STORMS.

San Francisco, January 8, 1906.

ELECTRICITY VS COMPRESSED AIR FOR MINE OPERATIONS.

The Editor:

Sir—In your issue of January 6, there appeared an article by W. R. Hulbert, who presented the advantages of electricity over compressed air for mining purposes. It is claimed that electricity is cheaper to produce, especially at a high altitude, that the transmission losses are less than in an air plant; that the dangers and expenses attending the uses of compressed air are great and that electricity has the decided advantage of being serviceable for the purpose of lighting. It is my purpose to refute these arguments.

Of course, it is well known that when two or more systems are available for accomplishing an end, each system has certain advantages not possible in the other. Such is also the case with the electrical and compressed-air systems. Regarding the first cost or the cost of installation, the advantages are much in favor of compressed air. As far as boilers and engines are concerned, each system calls for about the same investment; the equality of cost stops at this point. It is well known that the cost of installing a dynamo is greater per horse-power than for installing a compressor, and as the units decrease in size the first investment per horse-power increases, and, furthermore, the price of alternating current machines is in excess of that of direct-current generators.

If an alternating current is used and, if the current must be sent some distance, transformers are necessary at either end of the line, and, if direct current must be the working fluid at the tools, a converter is needed. It is thus seen that the number of units which comprise an electrical system are great and that as the number of units increases the investment cost must correspondingly increase. The advantage is, therefore, much in favor of the simple compressed air system. The latter requires for its economical operation a compressor, a good pipe-line and only one possible accessory in the form of a re-heater.

As the number of parts of a system of generation increases, the cost of maintenance and repairs increases also. Interest and depreciation, likewise, are important factors.

Altitude compression, due to the more rarefied conditions of the atmosphere, is accompanied by a slight increase in horse-power over that necessary at sea-level to produce the same results at the tool. This calls for the employment of a somewhat larger compressor. Even the additional cost of this larger machine still leaves much, as far as the costs of installation are concerned, to the advantage of a compressed-air system.

Beginning with a steam engine, is it cheaper to produce electricity or compressed air for mine operations? Taking the available energy in the steam engine as unity for both systems, we find that in transforming the work into electrical current at a certain potential there is an attendant loss of about 10%, under good conditions; these losses are due to friction, hysteresis and magnetization. It is granted that the energy gotten out of a compressor is less than that secured from a dynamo, but the difference is slight. The losses in the compressor are due to both the friction of parts and to the thermodynamic requirements. The latter loss arises from the fact that compression under pure isothermal conditions is impossible. Since the jacket water cannot remove the heat generated by compression as quickly as the ideal would warrant, actual compression lies between the isothermal and the adiabatic. These losses decrease more and more as the number of stages for compressing the air is augmented. At the power station have the advantage in favor of compressed this point a re-heater may be employed very slight additional cost for fuel, the energy air may be so materially increased as to advantage of electricity, leaving much the credit of compressed air.

Transmitting any energy necessitates trical current flowing over a conductor sarily decrease in intensity as the distance power station becomes greater. The directly upon the quantity of current through the conductor and also upon diameter and quality of the wire.

friction or resistance increases directly with the square of the current and directly with the length of the line. Resistance varies with the length of conductor and inversely as the diameter. To diminish, therefore, the watts lost in friction, either the current or the length of line must be decreased or the area of the wire increased; the first two conditions are impossible, since the machine to be operated must have, and will call for, a required operative current, and since the length of line depends upon the distance of the power-house station from the work, the only alternative left open to us is to increase the diameter of the conductor. Those who are at all familiar with copper costs can readily appreciate the great expense that this would entail. In fact, there are instances where electrical energy is transmitted some distance under moderate voltage, in which combined costs of the copper, poles and porcelain insulators were almost as great as that of the installation of the power plant proper. Of course, the resistance losses due to transmission may be decreased by sending power over the line at high voltage. This calls for alternating current, that the generated energy may be transformed at the power station to a current at high potential.

As the potential at the power station is increased, and since the products of the volts and amperes must be constant, the current must decrease. A transformer accomplishes this, giving a light current flowing at high potential attended with slight losses. These losses may be increased to reduce the copper cost by decreasing the diameter of the conductor and increasing the resistance of the line. In fact, with an alternating current we may secure with thin wire a copper loss no greater than that gotten with best conditions when employing direct current, but the use of alternating current necessitates the introduction of extra machines. We generate at the power station alternating current at normal voltage; this is raised by a 'step-up' transformer which has an efficiency of about 90% to 95%; the current at high potential is sent along the line with small copper losses until it reaches the place of application. At this point a 'step-down' transformer must be employed with its attending losses to bring the voltage to a safe amount for operative purposes. If the electrical tools call for direct current, as is generally the case, a rotary converter is needed to transform the current from alternating to direct. This transformation necessitates a considerable loss.

In transmitting compressed air we find different laws governing the losses. As the air flows through the pipes, the resistance of the inner surfaces must be overcome and this gives rise to a slight drop in pressure. Compressed air differs from electricity especially in the fact that electrical friction losses cannot be regained, while corresponding losses with compressed air may be eliminated. The moderate fall in pressure in the air due to friction augments the volume of air and does not involve a loss of transmission. As my friend, Mr. W. L. Saunders, has stated it: "If the air were at 80-lb. gauge or 95-lb. absolute upon entering the pipe and 70-lb. gauge or 85-lb. absolute at the other end, there would be a loss of a little more than 10% in absolute pressure, but at the same time there would be an increase of volume of 11% to compensate for this loss of pressure and the loss of available power would be less than three per cent." At the point of application of the air, the initial energy may be restored by adding a slight amount of heat to the air; in fact, the employment of a re-heater increases the volume to such an extent that additional energy is obtained when air is used expansively at the rate of *one horse power per pound of coal.*

In mine operations, not to interfere with the comfort and health of the men, the re-heater is never pushed for all that it is worth. Compressed air is only raised in temperature slightly, to make up for the transmission drop in pressure. Thus it is apparent that the loss of energy in transmitting air is nil; even when a re-heater is not used, the drop in pressure and the loss of energy are slight as compared with electrical transmission losses.

Electricity has the inherent difficulty-danger to the operator. The insulation may be defective and the effect of [illegible]ck may prove fatal. Where electricity is e[illegible]ed for mine haulage, a third rail or live wire is[illegible]and the [illegible]and, for apparent reasons, no insulation[illegible] the base [illegible]used; the only safeguard possible [illegible]ity, or the pow[illegible]"Danger! Don't Touch the Wi[illegible]other words, the [illegible]ntee from accident is a mere [illegible]manence of a species [illegible]live wires touched unintenor of a State depends o[illegible]the risk in the low headings [illegible]tion to its surrounding [illegible]ted warnings be of service

The fascinating idea that matter[illegible]he risk attending common substratum is of remote [illegible]a mine is obvious. middle ages the alchemists, inspire[illegible]curred in mines conceived the possibility of transfor[illegible] metals into gold. The sole difficulty [illegible]seclude the use the discovery of an appropriate ser[illegible]l mining con- operations. We now know that they [illegible]wed it may be definitely far from the goal of their sear[illegible]t ignorant, the com-

pressed-air line assists ventilation as do exhausts from all the tools; it reduces the effect of poisonous gases and dilutes or expels the smoky products of blasts.

The ventilation secured from compressed air is of itself an extremely costly process. As a matter of fact, however, no expense at all is involved, as the ventilation is obtained gratis from a waste. There is an instance on record where the exhaust air was of a noxious character; this was due undoubtedly to the bad practice of employing a poor lubricating oil in the compressor cylinder. Of course, such conditions should be guarded against; they are apparently so rare as to cause no alarm.

Electricity has one undoubted advantage over compressed air; it may be employed for lighting a mine. But who needs light throughout? Few lights are necessary, and those only at certain points. Were electricity employed for lighting purposes it would, nevertheless, be the best practice to have the lighting system independent of the power system, so that the lines may be intact in cases of emergency. As a matter of safety, the old form of miners' lamp has the advantage. Explosions are impossible and the light is always with the operator just where needed.

Electricity has advantages which are possible with no other form of energy, but for mining purposes compressed air far surpasses it as a driving fluid. Were the cost of installation, generation and transmission of compressed air greater than that for the electrical system, the facts of the danger in employing electricity should certainly preclude its use. Compressed air stands alone in this field of operation. It is cheap, reliable, safe and effective.

EDWARD F. SCHAEFER.

New York, January 10, 1906.

USE OF COPPER IN CHINA.—The copper trade was stimulated last year by the purchases made on Chinese account, some 45,000 tons of the metal having been shipped from this country to China. Most of this was for the manufacture of *cash*, a small coin in general use among the natives. Mints were established for this coinage, there being profit in the indiscriminate manufacture of alloys of copper with baser metals. This has upset monetary conditions in China, as is testified by the vice-consul at Hangchau, who says: "Already several viceroys and governors of the Empire have issued proclamations forbidding the importation of these copper coins into their respective provinces. Nevertheless the various provincial mints continue to run at full blast, turning out millions of these cheap coins every 24 hours, and forcing the people to accept them. In Hangchau there are two such mints, and the daily output is something like 1,500,000 of copper coins. These coins are nominally worth 10 cash. One year ago they were sold by the mints at the rate of 90 coins to one Mexican dollar. At present, however, the same coins can be bought at the rate of 98 to 105 for one Mexican dollar. The best of these coins, while selling normally for 10 cash each, are intrinsically worth only six to six and one-half cash, while there is a huge quantity being forced into circulation by the provincial authorities through local banks that are worth only three to five cash each. A new mint established in Hangchau last May has been for five months past dumping coins of this latter kind upon the merchants of the city at the rate of 200,000 per diem. The results of this sudden inflation of the circulating medium have been to drive the old genuine copper cash almost entirely out of circulation; to raise the price of nearly all kinds of foodstuffs and of fuel; to cheapen the copper coins themselves, owing to their plenitude, and to arouse general discontent among the masses of the people. The old copper cash, although grimy, bulky, and inconvenient to handle, has been the circulating medium among the Chinese for all minor business transactions for many hundreds of years, and to this the people are greatly attached. These old coins represent real value—many of them being composed of pure copper, and some even containing a little gold. And as a vast majority of the articles used in every-day life are bought for a few cash each, oftentimes for less than 10 cash, it is obvious that to replace these old coins with coins of no less than 10 cash value would not only cause the poorer classes great inconvenience, but in a multitude of cases an actual loss."

INCREASED USE OF CEMENT in building construction has caused an extraordinary increase in the production of this material. Although the manufacture of portland cement only began in 1875, and in 1889 the annual output had a value of only $500,000, in 1903 it had grown to $27,713,319. In 1904 the production in the United States was 26,505,881 bbl., valued at $23,355,119. Of this amount Pennsylvania produced 11,496,099 bbl. and California 1,014,558 barrels.

DELIVERY of the MINING AND SCIENTIFIC PREES to local subscribers was delayed last week by a cause beyond our control. We hold an official receipt proving that papers were received at the San Francisco Post Office at 2:20 p. m. on Friday. The delay in delivery is due, we understand, to a shortage in distributors caused by the demand upon the San Francisco Post Office for expert men to work on the new fast mail across the continent.

Mining Costs—A Suggestion.

Written for the MINING AND SCIENTIFIC PRESS by R. GILMAN BROWN.

Of late years it has been more than once urged that both logically and practically the fundamental basis for a segregation of mining expenditures should distingush between those that vary with tonnage and those that do not. In general the second division is used to cover administration and kindred matters; actually, each department has a large group of costs that bears about the same relation to the rest of that department that administration costs do to the other departments.

It is only when this fact is clearly recognized that the full weight of the argument in favor of the above segregation is felt; for instance, the mine foremen, pumpmen and hoist-engineers represent a practically constant expense; the same is true of the regular mill force; they are a fixed charge, just as much so as are office expenses and the superintendent's salary. It follows that segregation on these broad lines is of practical importance to the engineer and affords him a simple escape from the 'per ton' or 'unit cost' figures, which for this class of expenditure serve a doubtful end. When dividing totals by a variable tonnage to get the unit of cost, the fact that they should be nearly constant is forgotten, and if they chance to vary beyond a reasonable limit this fact is obscured by the introduction of another variable factor, the tonnage, so that an actual and perhaps unwarrantable increase may, in per ton figures, appear as a decrease. Nor must it be forgotten that this difference in the bearing of accounts is fundamental, and that even if a segregation that does not show it is used, hidden somewhere in the accounts, these fixed expenses exist and will make themselves felt by anomalies in per ton costs, that the careful manager will have to ferret out by perplexing side calculations, and that the every-day surface-of-things man will never think of or take the trouble to investigate. Impressed deeply by these considerations, it has become my custom to subdivide all department accounts on these lines and the method has so distinctly 'made good' that I do not hesitate to suggest it to others as worthy of adoption.

To one seriously considering this segregation, it will become apparent that with merely the two broad divisions there are certain expenditures that are intermediate; some are far from being fixed and yet they depend in no degree upon tonnage; others do, in a certain way, depend upon tonnage, but cannot be considered as proportional to it. In this borderland almost any number of classes can be made, but it is of the first practical importance that they be as few as possible to attain the end; in deciding upon their number the object of the whole classification must be kept clearly in view; the ideal must give way to the practical, and it is precisely on the score of practicality that this system is urged.

Personally, I prefer to divide all classes of expenditure into: Those that are independent of tonnage, subdivided into 'fixed' and 'variable'; and those that are dependent on tonnage, subdivided into those that are directly or proportionately and those that are indirectly dependent. Capital expenditures, that must be redeemed in some way by charges against operating accounts, form a class by themselves, but as they are written off at fixed periods they will appear among the 'variable' accounts of the first division; in certain cases they may belong among the 'fixed.' As construction is, in general, always under way, this will be the exception.

To present the matter in its simplest form and to show how naturally this method works itself out, I give below a summary of the mine cost-sheet for the month of October, 1905, of the Standard mine at Bodie, California. The letters over the first four columns are the initials of the main divisions of accounts: 'Fixed,' 'Variable,' 'Dependent' and 'Independent.'

With this before us it is clear, for instance, that the per ton figure of $1.534 for general labor means nothing definite, because three kinds of labor are included in it; it can only be used rightly for forecasting the costs in months where the tonnage is 1,931. And yet in any system that does not differentiate between the different classes of expenditure, this amount would be used in estimates and comparisons with the reliance we are so apt to place upon figures that have the appearance of exactness. For the tonnage given, the costs sum up to $5.40 per ton and the D. & I. accounts come to $4.10. In case of a smaller tonnage, say 1,500, as in November, the estimate would be as follows, which is obviously a more dependable figure than the total per ton cost of October:

F. & V. accounts, $2,525.32 ÷ 1,500	$1 68
D. & I. as before	4 10
Total	$5 78

Another point is brought out by the above example, namely, that segregation on this fundamental principle does not prevent a dissection of accounts into as small items as may be desired, so that all that is sought for in other systems is retained in this, and in addition other facts, which, as shown above' are of no small value to the engineer.

ACCOUNT.	F.	V.	D.	I.	Total.	Per Ton F. V. D. I.	Per Ton D. & I.
General Labor	$1,678 00	$248 00	$1,035 50	.....	$2,961 50	$1 534	$0 536
Ore Transportation	124 00	.....	.....	.....	124 00	064	.....
Development	.....	.....	.....	$2,237 05	2,237 05	1 158	1 158
Stoping	.....	.....	4,234 68	.....	4,234 68	2 192	2 192
Distribution Accounts	330 88	144 44	287 70	122 99	886 01	459	213
Total	$2,132 88	$392 44	$5,557 88	$2,360 04	$10,443 24	$5 407	$4 099

Tonnage for month, 1,931.

As tending to further make clear the principles involved, I give another example in a cost-sheet from a small California mine. This is still a summary, although it shows a greater degree of segregation than the first; it also covers all the operations and not a single department:

In this case, while the total unit-cost for the month is $4.48, had the tonnage been 2,000 it would have been $4.15, as is shown by the following:

ACCOUNT.	F.	V.	D.	I.	Total.	Per Ton F. V. D. I.	Per Ton D. & I.
Mine—							
General Labor	$479 44	.....	.....	.....	$479 44	$0 313	.....
Stoping	.....	.....	$1,639 17	.....	1,639 17	1 069	$1 069
Development	.....	.....	.....	$1,690 57	1,690 57	1 103	1 103
Filling	.....	.....	298 16	.....	298 16	0 195	0 195
Miscellaneous Supplies	.....	.....	.....	203 40	203 40	0 133	0 133
Fuel	.....	.....	322 17	.....	322 17	0 210	0 210
Expense	.....	.....	.....	266 77	266 77	0 174	0 174
Mill—							
Labor	410 60	.....	.....	.....	410 60	0 268	.....
Power	240 00	.....	.....	.....	240 00	0 1157	.....
Supplies	.....	.....	155 52	.....	155 52	0 102	0 102
Ore Transport	147 50	.....	17 08	.....	164 58	0 107	0 011
Distribution Accounts—							
Shops	340 10	.....	.....	23 67	363 77	0 237	0 015
Assay-office	90 00	.....	.....	19 94	109 94	0 072	0 013
Water-power	.....	.....	.....	27 75	27 75	0 018	0 018
General Accounts—							
Administration	264 30	.....	.....	.....	264 30	0 173	.....
Miscellaneous	109 98	$108 66	.....	15 68	234 32	0 153	0 010
Total	$2,081 92	$108 66	$2,432 10	$2,247 78	$6,870 46	$4 484	$3 053

Tonnage, 1,532

F. & V. accounts, $2190 58 ÷ 2,000	$1 095
D. & I. accounts	3 053
Total	$4.148

In the two above examples, both F. & V. accounts and D. & I. accounts are treated together, but it introduces no complication, and it is at times advisable to consider them apart. The 'fixed' should be practically constant, so that any material change in their total at once sets one in search of the cause; the 'variable' will ordinarily swing between certain limits, and if these are exceeded but a few accounts need be searched. The reason for changes in the unit figures of the 'directly dependent,' if it does not lie in changed physical conditions, or cost of labor or supplies, involves the personnel of the force; while the 'indirectly dependent,' being non-proportional functions of tonnage, will owe their per-ton changes to other causes, which a more extended dissection should show. It follows then that, in general, this last division will demand more itemization than the others. The degree of this in the full cost-sheets, of which the above are but summaries, is one of those details that can only be settled by consideration of the local conditions and needs.

In conclusion, it is believed to have been shown that by the adoption of these basal divisions and the abandonment of unit-costs for expenditures that are independent of tonnage, the work of the mine can be more easily and closely watched, and reliable forecasts for altering conditions be more quickly made.

THE discoveries of banket in Rhodesia, announced a year ago, are affording evidence of value. In El Dorado mine there is four feet of 2½-oz. stuff at a depth of 120 ft., and other openings show from one to four ounces gold ore. E. H. Garthwaite, a Californian, is in charge of these explorations.

Copper Refining.

By LAWRENCE ADDICKS.

In refining copper by the electrolytic method high-grade anodes are universally used in America. Usual compositions are:

Copper	98 to 99.5	per cent.
Silver	0 to 300	oz. per ton.
Gold	0 to 40	oz. per ton.
Arsenic	0 to 2	per cent.

Small amounts of antimony, bismuth, iron, nickel, sulphur, selenium, tellurium and silicon.

Impurities with soluble sulphates go entirely into solution and grow cumulatively. Selenium and tellurium and the precious metals go entirely into the slime. We have, therefore, a triple separation. The usual products are only copper at the cathode, silver and gold from the slime, and sometimes copper and nickel sulphates from the electrolyte. Selenium and tellurium, especially the latter, are easily recoverable from the slime, were there sufficient market. Tellurium is an element almost without use in the arts. Small amounts are used in medinine, but the output of one of our copper refineries for one day would stock a large chemical supply house with tellurium enough to last a year. Arsenic, antimony and bismuth go partly into solution, partly into the slime, depending on the nature of the form of combination in which they exist in the anode and various secondary reactions taking place in the electrolyte.

Arsenic is the most difficult impurity with which to deal. If much is present in the anode, say over 1%, it rapidly grows in the solution and necessitates a large expenditure for purifying to hold it down. With small quantities it seems to slime more rapidly and no purifying at all is necessary. With other conditions properly cared for, satisfactory cathodes can be produced in an electrolyte running 2% arsenic, though this is considerably above the customary figure.

The purification of solutions is almost always done by working up a certain quantity regularly into bluestone and adding fresh acid to the electrolyte. If the purification requirement is heavy the bluestone department becomes disproportionately large, and consequently copper running high in arsenic is most unwelcome. Antimony and bismuth are seldom present in sufficient quantity to cause trouble. Various chemical methods of purification have been tried with the object of regenerating the electrolyte and returning it to the circulation, but there are few substances that will precipitate arsenic in an acid solution, and further the action of such reagents does not seem reliable, probably due to differences in form of arsenic compounds present at different times.

The insoluble anode slime from which the gold and silver are recovered is very variable in composition, as might be expected, depending on the grade of material being handled. It is chiefly metallic in nature and a common composition would be as follows:

	Per Cent.
Silver	40
Gold	2
Copper	25
Selenium and tellurium	5
Arsenic and antimony	10
Lead, silica, sulphuric acid, etc	18

The presence of so much copper in the slime is objectionable in the silver refinery process and must be removed before cupelling the dried slime to avoid making rich slag. The other impurities give but little trouble, except possibly tellurium, which requires prolonged furnace treatment to burn it off.

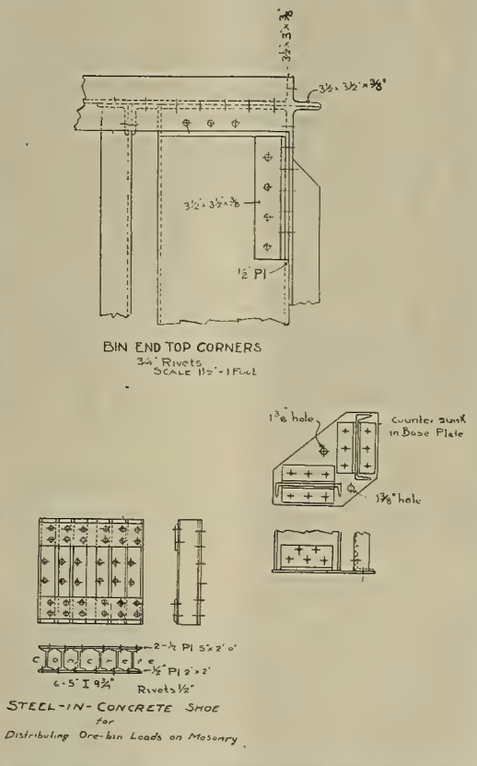
The cathode copper is exceedingly pure, usually running about 99.93% copper, with hydrogen as the chief impurity. Objectionable cathode impurities are of two classes—those which depress the electrical conductivity and those which make the metal brittle. Arsenic and antimony represent the first class; tellurium and lead the second. Good cathode copper should show but a few thousandths of a per cent of arsenic and antimony. Experiments have indicated that it takes but 0.0013% of arsenic or 0.0071% of antimony to lower the conductivity 1%. A third class of cathode impurity concerns the refiner, comprising silver and gold. Cathodes usually show from one-tenth to one ounce of silver and a trace of gold. This seems to be due entirely to the mechanical fouling of the cathode by particles of anode slime. In fact, it is a question if most of the arsenic and antimony found in the cathodes do not have a similar origin. The slime is very finely divided and the continual circulation of electrolyte necessary to prevent polarization maintains a very slight turbidity. These particles are probably electrostatically attracted to the cathode.*

AS A STRUCTURAL BUILDING MEMBER, re-enforced concrete shows an economical distribution of material. Steel is provided to take care of all direct tensional stresses and those shearing stresses for which the concrete is not sufficient. Compressive stresses are taken care of by the concrete. At least one-half the stress in a beam is provided for by the concrete whose unit cost is comparatively low. At one time it was supposed that the introduction of concrete would lessen the use of steel, but it has had the contrary effect. The reduced cost of concrete construction and the rapidity of working has stimulated building to an unprecedented extent.

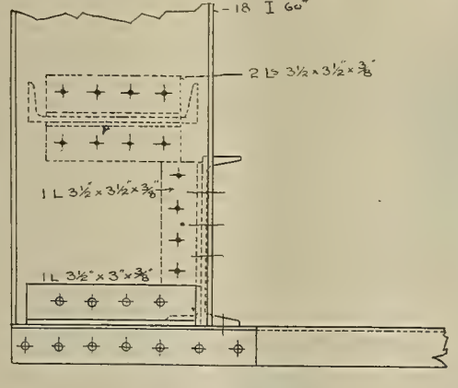
* Abstract from *Journal of the Franklin Institute*, December, 1905.

Steel Ore Bins.

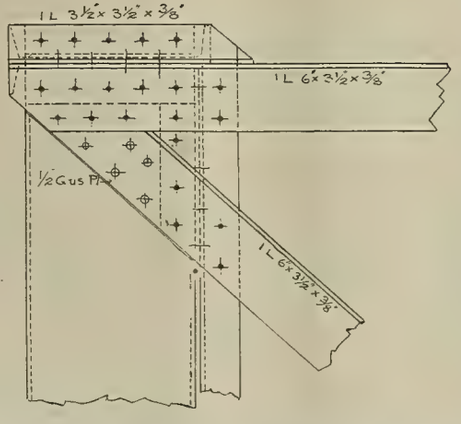
The accompanying drawings illustrate the construction adopted at the Bustos mill, at Guanajuato, certain featares of which were described in our last issue. The steel bins are supported on walls of masonry. The bin skeleton is of 15-in. channels



placed back-to-back in bents which are on approximately 6-ft. centers, the vertical channel posts being tied together at bin-floor level by two 15-in. channels, which are braced from the feet of the posts



Details of Steel Bins.

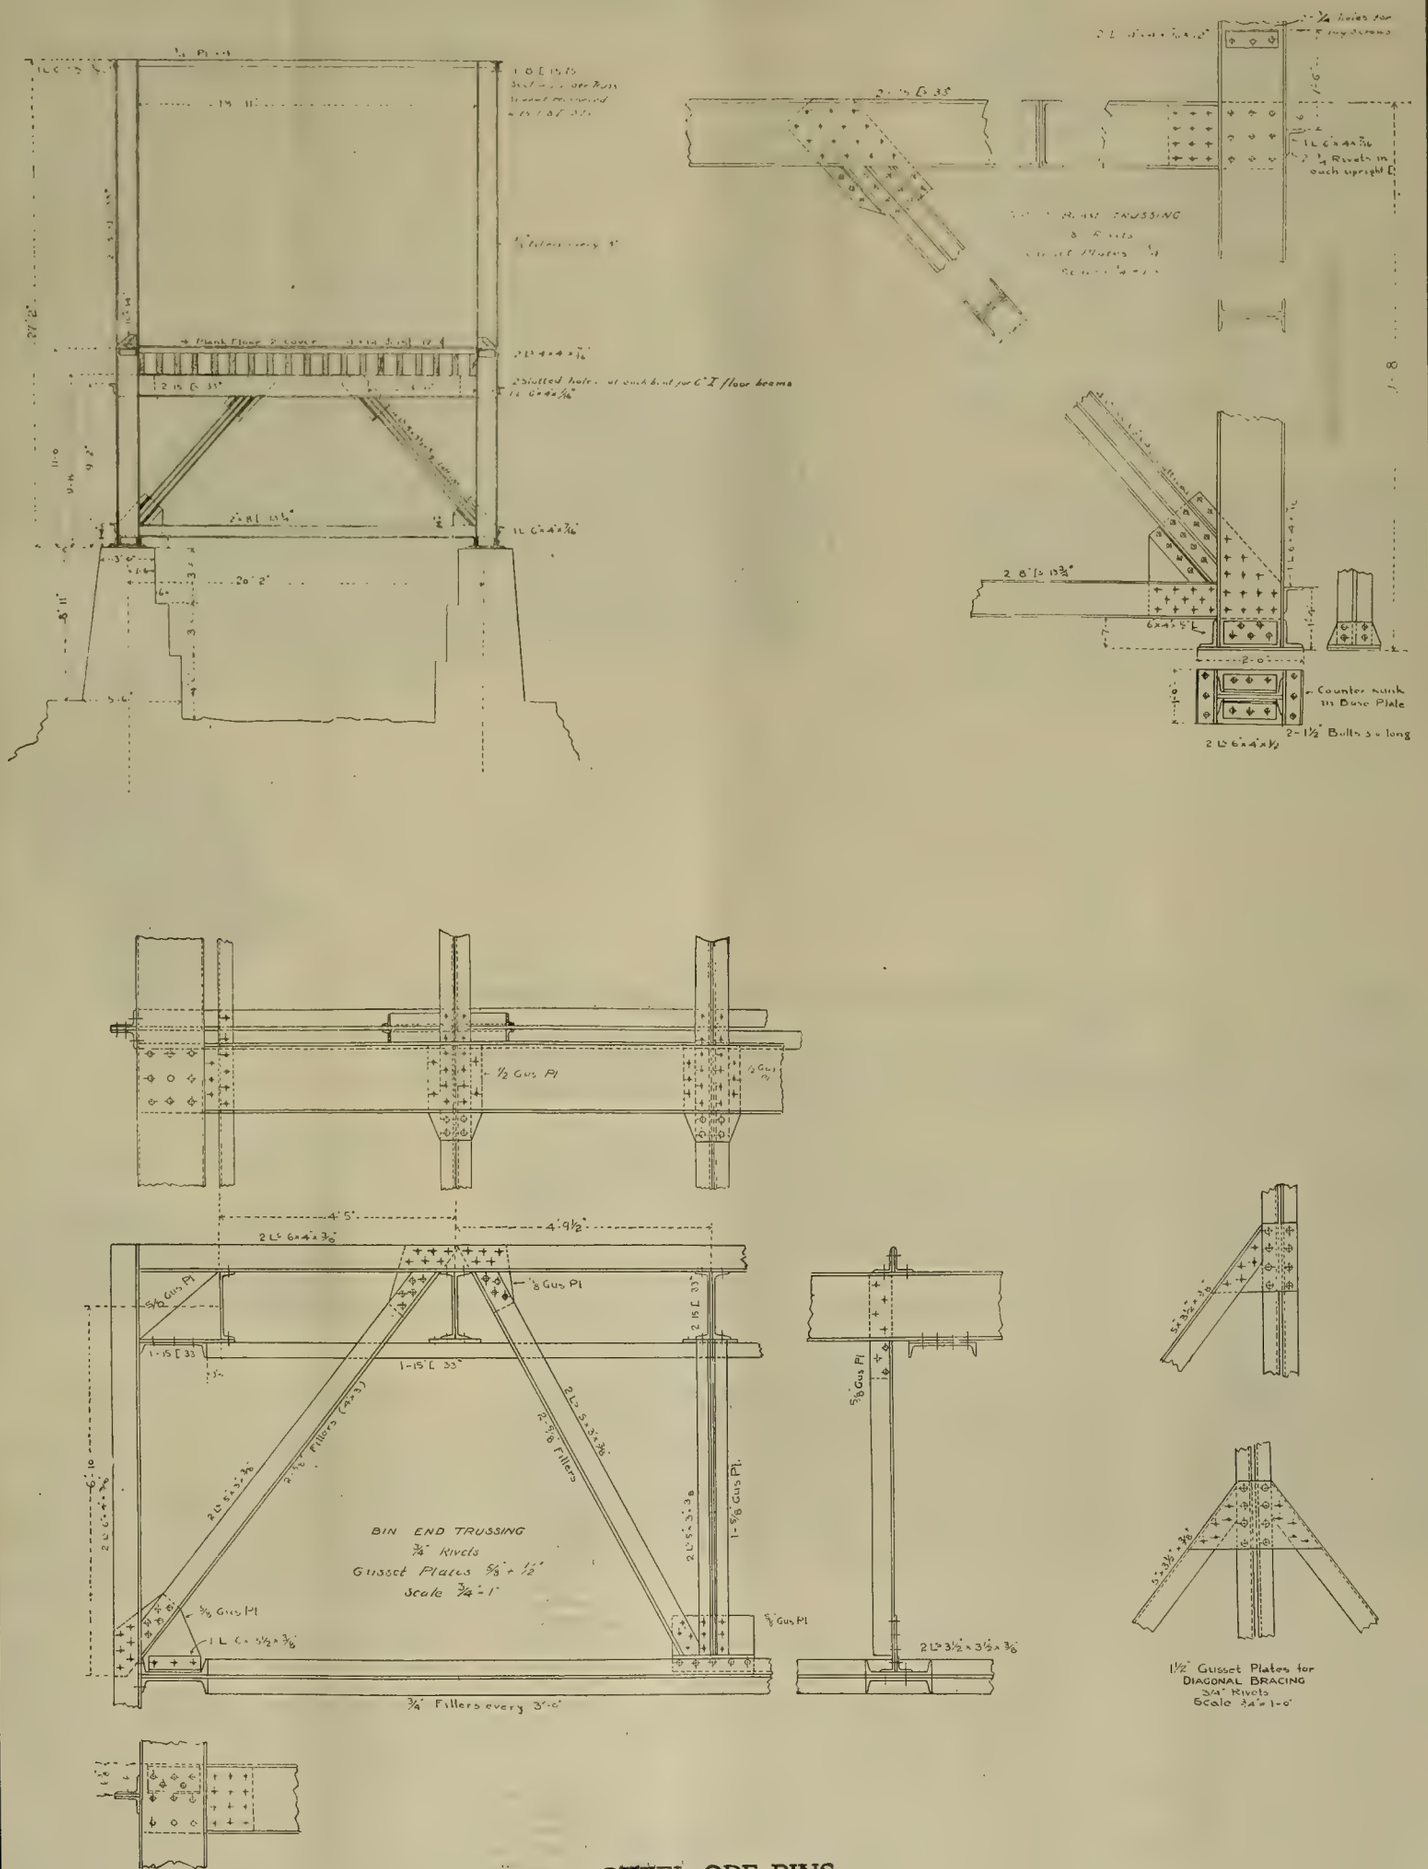


by inclined struts composed of four 5 by 3½ by ⅜ in. latticed angles. The thrust which these inclined struts carry to the feet of the posts is taken by two 8-in. channels acting as a tie between the feet of the posts, thus trussing the whole and converting the strains on the masonry into purely vertical strains. As the weight in the bin is very heavy—about 2,500 tons, exclusive of the bin itself—the feet of the columns are supported upon a grillage of six 5-in. I-beams, two feet long, held together by plates riveted to the tops and bottoms. This rests directly upon the masonry. These bents are braced together longitudinally at the top and floor-level of the bin by 8-in. channels and heavy angles; at the ends of the bin the outward thrust upon the bents is taken by a truss member at the top of the bin. The bents themselves are tied together at the top by ¾-in. plates 4 in. wide, riveted between the channel-beams to the posts. Within this skeleton is a lining of plank, 4 in. thick in the bottom courses with an inner sheathing of 2-in. plank with the grain vertical. The bin has a flat bottom supported on 4-in. by 14-in. joists on 12-in. centers, carried upon horizontal members of the steel bents before mentioned, on the top of which is laid a 3-in. plank floor covered by a 2-in. lining.

IT is proposed to transmit electric power from the Victoria Falls on the Zambesi, in central Africa, to Johannesburg, to be used at the mines of the Rand. It is expected that a total saving of $10,000,000 can be effected in the cost of motive power. Sir Charles Metcalfe, the organizer of the Cape to Cairo railroad, is credited with this grand idea of power transmission.

THE LARGEST AIR COMPRESSOR IN THE SOUTHWEST.—American copper mines are famed for the magnitude and completeness of their mining plants. The Michigan copper country has long held first place in the competition for large and costly compressed-air equipment. But a recent order placed with the Ingersoll-Rand Company, of New York, shows that the tendency toward centralization of air-power in large units is working into other fields. The management of the United Verde copper mine at Jerome, Arizona, has just contracted with the manufacturers mentioned above for a cross-compound condensing two-stage Corliss air compressor which, when installed, will be the largest compressor unit in Arizona and the Southwest. The order calls for a 48-in. stroke machine, with steam cylinders of 28 and 52 in. diam. and air-cylinders 44¼ and 26¼ in. Steam-cylinders are jacketed, with valves in the heads. The machine is to operate under 110 lb. steam-pressure and a vacuum of 20 in.; a high steam economy is guaranteed. The air-cylinders will be jacketed on heads and barrels and will be fitted with piston inlet air-valves. The compressor will run at 75 r. p. m. at which the piston displacement will be 6,060 cu. ft. of free air per minute. The air-pressure is to be 100 lb., and the altitude is about 5,500 ft. The United Verde is popularly known as one of the greatest copper mines in the world, and the ordering of this large compressor seems to indicate that its immense ore reserves are by no means exhausted.

CHEMICAL TEST FOR WOLFRAM.—As a tungstate of iron and manganese, it gives a gray, infusible mass on charcoal; with borax lead it gives a colorless beading in the oxidizing-flame; in reducing-flame it gives a yellow bead while hot, which changes to yellowish-brown when cold. With microcosmic salt it gives a colorless bead in the oxidizing-flame, while in the reducing-flame it is a dirty green when hot, and becomes blue on cooling; on the addition of iron it is blood-red. Wolfram, when present in small quantities, may be detected as follows: The sample is fused with about five times its weight of sodium carbonate, the mass extracted with water, and the tungstic acid precipitated in the form of a white powder by means of hydrochloric acid. This precipitate becomes yellow on boiling, and is insoluble in excess of the acid, but dissolves in ammonia. The solution after acidification gives a deep-brown coloration with potassium-ferrocyanide, and after some time a precipitate of the same color separates out. The solution, after adding the ammonia, gives a white precipitate with silver-nitrate and yellow stannous chloride. On acidification with hydrochloric acid and warming, the precipitate becomes a beautiful blue color, which is very characteristic. If wolfram is treated with strong sulphuric acid and some zinc added to the solution, the solution will have a deep-blue color. Wolfram is usually associated with tinstone, and for a long time the separation of the minerals was a matter of considerable difficulty. It is now effected by roasting the crushed minerals with carbonate of soda, by which means tungstate of soda is formed and the tin-ore can be separated. The tungstate of soda thus formed is used with starch for rendering light fabrics, such as muslin, uninflammable. It is also employed as a mordant by dyers; it is also used for hardening plaster of paris; and it is the chief source from which tungstic acid is derived. For the estimation of the quantity of wolfram present the best method is as follows: Take 10 gr. of the substance and boil for about an hour with 25 c.c. of pure hydrochloric acid, then add 5 c.c. of pure nitric acid; boil for half an hour, and then allow to stand about 12 hours. Dilute with an equal volume of water and filter. The iron and manganese are obtained in solution, while the silica and tungstic acid compose the residue (with, perhaps, tin). Collect the undissolved residue, filter and wash with dilute hydrochlorine, dissolve in warm ammonia, filter off the undissolved residue—silica and possible tin. Dilute the solution and evaporate to dryness in a weighted porcelain dish; when dry, ignite carefully till it assumes a uniform yellow color, cool, and weigh. The iron and manganese, etc., are then to be estimated.—*Mining Journal, London.*



STEEL ORE BINS.

An Important Decision.

Written for the MINING AND SCIENTIFIC PRESS by ALBERT BURCH.

On January 8 the United States Supreme Court finally disposed of two suits in equity involving questions of general interest to mining men. They were known to the parties interested as the Stemwinder and Bunker Hill 'extra-lateral right' suits, and in both cases the action of the Supreme Court was to deny writs of *certiorari*, while in the Stemwinder suit an appeal was also dismissed.

The Stemwinder suit was begun in 1902 in the Federal Court for the District of Idaho by the Bunker Hill & Sullivan Mining & Concentrating Company, complainant, against the Empire State Idaho Mining & Developing Company, respondent. The Bunker Hill suit was brought in 1901 in the same court by the same complainant against the same respondent together with the closely affiliated Last Chance and Shoshone Mining Companies, all of which have since been merged with other companies in the Federal Mining & Smelting Company, which is now the real party in interest.

The action of the Supreme Court not only confirms to the Bunker Hill Company title to valuable orebodies, but also decides some important legal questions.

Reference to Fig. 1 will aid in an understanding of the Stemwinder case. Of the claims shown therein, the only one owned by the complainant is the Stemwinder location, unpatented. The Emma and Last Chance claims, senior in title to the Stemwinder, were the patented property of the Last Chance Mining Company, not a party to this action; and all other claims were owned by the respondent and junior to the Stemwinder. The foot-wall of the vein at the surface has a course through the claims about as shown in the diagram, and its true strike is about N. 40° W. The dip is southwest at about 40°. This wall marks a strong persistent fissure, which cuts the quartzite beds of the country on both strike and dip, and is a sharp line of demarkation between the vein on the one side and the country rock on the other. From this strong fissure, subsidiary crevices extend long distances into the hanging-wall country, having, most commonly, the strike and, frequently, the dip, of the quartzite beds. This condition results in the formation of large orebodies at distances as great as 400 ft. horizontally from the foot-wall, or about 250 ft. measured at right angles to its plane, and to the deposition of small particles of galena in the less shattered rock even further away from the controlling fissure. Beyond this even the surface quartzite is often heavily stained by iron, a fact which was used as a basis for the contention of the respondent that the true lode is at least 1,500 ft. wide, and that therefore only a part of the width of the apex is covered by the Stemwinder claim. The Court held, however, in both this case and the Bunker Hill suit, that the hanging wall of the lode is a commercial one; defined by the limits of workable ore and therefore not distant more than about 250 ft. at right angles from the foot-wall. Thus, both walls cross the northerly and southerly lines of the Stemwinder location and extra-lateral rights were granted accordingly.

No claim was made to the orebodies between the planes I-J and K-L, bounding the adjudicated extra-lateral rights of the Last Chance claim, and the novel question was raised whether the rights of the Stemwinder claim should stop entirely at the plane K-L, or whether they should merely be suspended on that plane and resumed again beyond the plane I-J, as against the extra-lateral rights of the junior Viola and San Carlos claims and the rights arising from the surface ownership by the respondent of the Jersey Fraction, Skookum, Cariboo and other claims, which were not held by the Court to contain any portion of the apex. This novel question was decided by the Court in favor of the Stemwinder and it was awarded extra-lateral rights between its side-line and the line K-L and beyond the line I-J between the end-line plane R-Y of the amended location and the side-line plane N-X of the original location, the amended location having been made subsequent to the location of most of the respondent's claims. On appeal, this decision was upheld by the Circuit Court of Appeals and it remains undisturbed by the Supreme Court. It will also be observed that the lines of the Stemwinder location are laid on, and across, the prior Last Chance and Emma claims, and the complainant claimed the right to use the end-line, so placed, to define extra-lateral rights not in conflict with those of the Emma and Last Chance. While this was not entirely a new question, it is interesting; and in ruling on it, the Courts granted the complainant's demand.

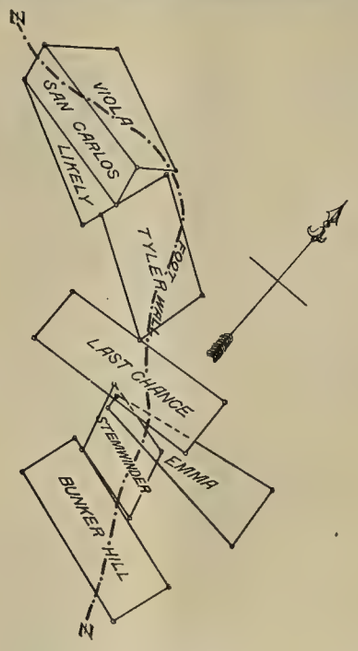


Fig. 2.

The Bunker Hill case involved the adjudication of the extra-lateral rights of the Bunker Hill claim located on the same vein and its position with reference to some of the apex claims of the respondent's, as shown by Fig. 2. The Bunker Hill location was practically admitted to be senior to all the locations of the respondent's locations and after the determination of the facts only one interesting legal question remained to be decided. Respondents again contended for a very broad lode having a foot-wall, as shown in Fig. 2, and a hanging wall entering through the southerly side-line and passing out through the westerly end-line of the claim as originally located. On this theory they claimed that the Bunker Hill location should be adjudged to have extra-lateral rights southerly between a plane passed through the original west end-line and one parallel therewith, passing through the point of intersection of the foot-wall with the southerly side-line. Again the Court held to the commercial hanging wall and, with the entire vein crossing the side-lines of the claim, they were thereby transformed into legal end-lines and extra-lateral rights to the west were granted. The novel point raised by the respondents was that the complainant could not be allowed to follow its vein as desired because it would be following more nearly on its strike than on its dip. They contended that owing to a supposed southerly bend in the vein a point would be reached at a vertical depth of about 6,000 ft. from the surface where anyone following the vein between the planes of the Bunker Hill lines would actually begin to rise with the vein and would, at a distance of about three miles, reach the surface again (See Fig. 3). The Court evidently did not believe this theory, which could only have been demonstrated by workings to a vertical depth of about 6,000 ft. on a vein with an average dip of 40°; but clearly decided that a claim owner had the right to follow his vein downward between the two parallel or converging lines which are crossed by the apex of the vein, even, if more nearly on the strike than on the dip. This decision for the complainant has also been sustained by the higher courts.

Fig. 4 is an interesting illustration of the interlacing extra-lateral right segments, which the legal interpretation of these cases gives to some of the numerous locations on this great vein. The projection shown is on the plane of the foot-wall.

Science, however diverse its aims, is a whole, and men of science do well to impress on the captains of industry that they should not look askance on those branches of investigation which may seem for the moment far beyond any possibility of practical utility.

California Miners' Association.

Standing committees of the California Miners' Association for the present year have been appointed by President Alfonzo A. Tregidgo, as follows:

Executive Committee — Edward H. Benjamin, Lewis T. Wright, Fred W. Bradley, S. B. Christy, W. F. Englebright, H. H. Yard, G. McM. Ross.

Committee on Finance—Eugene de Sabla, John Martin, Andrew Carrigan, Thomas Rickard, Joseph Sloss, James V. Coleman, George Starr, A. D. Foote.

Committee on Legislation—John F. Davis, A. Caminetti, C. W. Cross, T. A. Rickard, Charles G. Yale, Tirey L. Ford, John R. Tyrrell.

Committee on Mineral Lands and Conservation of Water—A. H. Ricketts, Niles Searls, J. M. Gillette, W. H. Clary, H. Z. Osborne, Frank R. Wehe, S. B. Christy, Charles E. Uren.

Committee on Department of Mineral Industries—W. C. Ralston, J. B. Irish, C. M. Belshaw, W. F. Prisk, F. A. Leach, F. Solinsky, Ross E. Browne.

Committee on Debris Dams—Fred Searls, Fred Harvey, W. P. Hammon, L. L. Myers, J. O'Brien, W. O. Halstead, A. B. Foote, J. S. McBride, W. W. Waggoner.

Committee on Election—W. H. Storms, Nat P. Brown, E. A. Rix, E. J. Ensign, H. E. Miller.

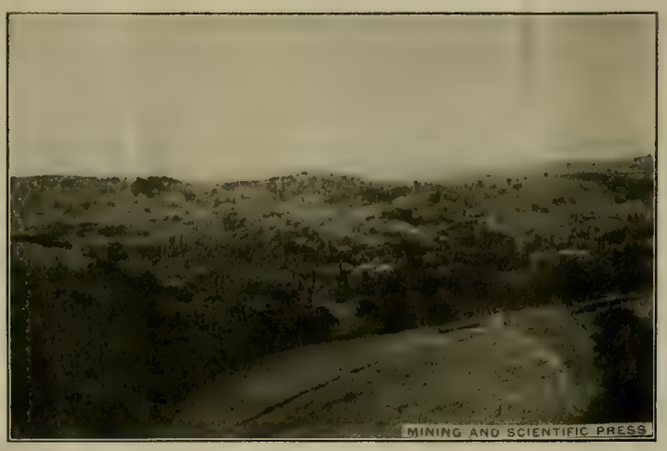
An advisory committee, consisting of all past presidents of the Association and two members selected at large from each county in the State in which mining is prosecuted, will be named in the near future.

Ore Deposition and Deep Mining.

By WALDEMAR LINDGREN.

To the gold miner who has payable ore, the most important question is: Will the ore go down? Does it get richer or poorer? And of answers to this there are many.

Soon after deep mining began in Australia and California, it was found that many veins which were rich at the surface turned poor at a relatively slight depth; in consequence, an opinion developed that the gold in the veins after all was a surface formation. We understand now, of course, that this view was to some extent justified in that an enrichment by surface waters is the rule in the croppings of the majority of gold-bearing veins and is especially prominent in dry climates. On the other hand, it was not appreciated or understood that erosion had removed so much material that the present croppings might be thousands of feet below the point where the fissure reached the surface during the vein-forming epoch. The matter is further complicated by the normal occurrence of the payable ore in 'shoots,' or elongated bodies, distinctly limited laterally and vertically, and by the fact that each vein may contain several of these, below each other, so that their discovery would be a question of more or less extensive exploration.



Sutter Creek, California, the Home of Deep Mining.

We are now able to ascertain that the veins in certain districts were formed relatively close to the surface. These veins usually cut through beds of volcanic rocks, relatively recent flows, the upper surface of which at the time of vein formation we can determine with more or less accuracy. Such are many of the veins of western Nevada, of the Huaraki Peninsula in New Zealand, of Owyhee county in Idaho, and of the San Juan and Cripple Creek regions in Colorado.

In other parts of the world the veins may intersect intrusive rocks, like diorite or granite, which we know to have consolidated at great depth and which were most probably once covered by heavy masses of just such lava flows as are referred to above. From geological studies we may know, with relative exactness, the date of vein formation which is likely to be remote compared to the class of veins alluded to in the previous paragraph. Such are the veins of the southern Appalachian States, of the gold belt of California, and of Australia.

With these generalizations in mind we have a basis for comparison of ore values, although additional data along the lines mentioned are much to be desired. Careful judgment of individual cases is, of course, necessary; for we may conceive surface lavas accumulated in such masses that in their lowest beds the veins would have the same depth from the surface as veins in intrusive and deeply eroded areas. It is also possible that intrusive rocks may be injected to levels only one or two thousand feet below the surface. This has happened, for instance, in the San Juan region in Colorado. The vital point is the correct estimate of the amount of erosion which has taken place.

Among the causes which produce ore precipitation from aqueous solutions the most generally advocated are (1) mingling with other waters, (2) reducing agents, such as carbon or ferrous sulphate, and (3) diminishing pressure and temperature. The last cause has been most freely advocated, and often for cases of small differences of depth. I have shown elsewhere† that, although it is of great importance, the argument must be applied with much discrimination since actual observations show that ore precipitation takes place within a wide vertical range. If it can be shown, however, that ore deposition changes in depth, gradually and generally, that change must be due to pressure and temperature.

A review of the veins which cut through surface lavas will show that many of them have been followed down for over a thousand feet from a point which was undoubtedly near the original surface. In the Silver City district a depth of over 2,000 ft. has been attained, in Cripple Creek 1,500 ft., and in the San Juan country, Colorado, at least one of the veins has actually been proved payable within a vertical range of 3,000 ft. But in most cases the ore—which generally is of higher value than in the deep gold-quartz mines in California—seems to decrease somewhat in quantity and value as the lowest levels are reached, and in many cases the decrease is marked and conspicuous. Extremely rich masses of ore—bonanzas—within moderate distance from the original surface are really characteristic of these veins, and are frequently still further enriched by oxidation and the formation of secondary sulphides.

A review of the veins which cut through large intrusive masses and their surrounding sedimentaries and whose upper parts have been removed by erosion leads to encouraging results, especially with veins carrying free gold. First among them we should mention the veins and saddle reefs of Bendigo, Victoria, which have lately been opened at a maximum depth of 4,156 ft. and proved payable, in part at least. But it is stated that below a vertical depth of 2,500 ft. fewer orebodies have been found than above that limit and that the deeper explorations have not as a whole proved economically successful. The amount of rock removed by erosion since vein formation in this district is difficult to estimate. Some of the figures given by Australian geologists seem far too large, but at any rate it must be at least 3,000 ft.; so that we may assume that deposition of free gold with quartz took place at least to a depth of 7,000 ft. below the original surface.

In the deep Ballarat quartz mines the grade and quantity of ore appear to decrease somewhat in depth, although they have scarcely attained a depth of 2,000 feet.

Turning now to the California quartz mines in the foothills of the Sierra Nevada, the latest results (which, as yet, are little known beyond the State) offer much encouragement to those who believe in deep mining. In Grass Valley 10 years ago the outlook for the two principal mines, the North Star and the Empire, seemed doubtful; since then the former mine has found ore equally as rich as in upper levels down to a vertical depth of 1,600 ft. or 4,100 ft. on the incline of the vein. The Empire has sunk its shaft to 3,160 ft. on the incline (1,286 ft. vertically) and it was recently stated in the press that the ore-shoot had been found on the 3,000-ft. level. Many years ago the Idaho mine in the same camp found ore at a vertical depth of 2,200 ft., but the explorations were discontinued owing to the fact that the principal ore-shoot was located at a higher level and seemed far more inviting to follow.

On the Mother Lode deep mining has principally been carried on in Amador and Calaveras counties. The depths of some prominent mines are as follows:

	Incline. Feet.	Vertical. Feet.
Lincoln	2,000	1,766
Ballot	....	1,800
South Eureka	....	1,800
Central Eureka	2,300	2,030
Oneida	....	2,300
Kennedy	....	2,863
Argonaut	....	2,100
Zella	....	1,300
Gwin	....	2,380

The Kennedy is now said to be stoping on the 2,700-ft. level; the Central Eureka at a depth from 1,900 to 2,000 ft.; the Oneida below the 1,900-ft. level; the Gwin below the 2,000-ft. level. These gratifying results have proved that at the depths indicated free gold ores are found of similar character to those occurring nearer to the surface, although the rich pocket bonanzas seem to be of less frequent occurrence in the deeper workings. The hope of finding payable ore at still greater depth has been greatly strengthened, and it may well descend to the deepest levels attainable by mining. On account of increasing temperature this will perhaps not greatly exceed 5,000 ft. The thickness of crust removed by erosion in the foothill region since vein formation is, of course, difficult to estimate with exactness, but it may not exceed 3,000 ft. At any rate it seems certain that deposition of free gold ores in the California veins has proceeded at depths from the surface of about 6,000 feet.

The gold deposits of the southern Appalachian States offer an example of deep 'roots' of veins; the amount of erosion from the croppings at the time of deposition doubtless greatly exceeds the figures given for Australia and California, and still free gold ores have been found and followed in some cases to a depth of over 1,000 ft. They are usually of low grade, although small shoots and pockets of ore occur which are fully as rich as anything found in California or Australia.

It may, therefore, be confidently asserted that deposits of gold-quartz ores extend at least over a vertical range of 6,000 or 7,000 ft. There is some evidence that the conditions for deposition grow less favorable as depth increases, but the change takes place slowly. The richest ores are those near to their original apex. Most of the deep mines in the Mother Lode region of California carry ores of comparatively low grade ($4 to $8 per ton), and are only payable on account of the availability of cheap metallurgical processes.*

The Kennedy Mine, Jackson, Amador County.

THE names of the new camps in Nevada are mostly of Piute origin. The Piutes—an Indian tribe—formerly traversed the region. 'Pah,' a termination frequent in such names, means water; so that Tonopah may be translated 'brush springs,' Ivanpah is equivalent to 'stagnant water' or 'quiet pools.' Panamint is usually spelt without the h, but it ought to be Pah-na-mint, which standsfor 'water from snow.' The highest peak of the Panamint range is snowclad throughout the year; Furnace creek rises between the peak and the Funeral range, being fed by the snows of both ranges.

MINING is an important feature of Norway's industrial life: Iron, copper, feldspar, granite, etc., abound. In 1904 Norway exported 116,550 tons of iron pyrites and 2,700 tons of copper. Her iron is needed in Birmingham, Sheffield, Solingen, and all over the world for the making of certain instruments, implements and tools. She exported 21,000 tons of feldspar in 1904. Much of this is used in the porcelain factories of the outside world. Granite and other building stones are exported to England and continental Europe. Over 190,000 tons were taken out in 1904.—*Iron Age.*

*Abstract from an article appearing in *Economic Geology*, Vol. I, No. 1.

†'Nevada City and Grass Valley,' 17th Ann. Report, U. S. Geol. Survey, Part II, p. 177.

The Progress of Half a Century.

In celebrating its semi-centennial *The Iron Age* says:

The nineteenth century witnessed a development in the arts and sciences more rapid and more uniform than that attributable to all the centuries of the historic period which preceded it. What may have happened in the mysterious 'East' before the curtain rose upon a civilization of unknown antiquity is a matter of conjecture; but it is safe to assume that, however high in some aspects, it was very unequally developed and that there are no 'lost arts.' The nineteenth century received undiminished its heritage of knowledge and added thereto vastly more than it had received. It was the golden age of invention and discovery, probably because it found itself confronted by so many relatively easy problems.

Grant Allen, in one of his charming natural history essays, tells us that for centuries there has been a struggle between the squirrels and the nuts. The nuts, for their better self-protection, have been thickening their shells, and the squirrels, to get their food the better, have been strengthening and sharpening their teeth, with the net result that all the soft-shelled nuts have been eaten and are extinct in squirrel-haunted forests, and the squirrels with dull and weak teeth have starved to death and left no successors. This happy conceit may very well be chosen to illustrate the relation which for a century has existed between the inventor and his problems. A few basic discoveries of natural phenomena, before unobserved or quite misunderstood, opened the door to thousands of relatively easy problems in chemistry, metallurgy, mechanics and engineering. The difficulties they presented were largely the result of the limitations which hampered the inventor in available materials and tools. The end of the century found most of these relatively easy problems, and many of those presenting great difficulties, successfully solved. There now remains very little room for the empirical inventor who turned to practical account the happy accidents which he had learned to observe and reason about. In a word, the soft nuts of the arts and sciences have mostly been eaten, and the race of inventors who did little more than pick up what they found lying around neglected, if not dead, has lapsed into relative unimportance.

This illustration applies better to the first half of the nineteenth century than to the last half. Especially in its last quarter it was made glorious by results which confused statistics and silenced prophecy.

It was not until May 24, 1844, that the first intelligible message was sent over the wires stretched between Baltimore and Washington, in the words: "What hath God wrought?" Practically the whole system of electrical communication has developed since 1855, the year of the beginning of *The Iron Age*, certainly all of it which contributed to the facilitation of trade. Duplex telegraphy was not reached until 1872, and multiplex not until 1878. Electric signaling began in 1857, but did not reach an important development until some 10 years later. The first Atlantic cable message, from Queen Victoria to President Buchanan, was sent August 16, 1858. Wireless transmission is, of course, a matter of yesterday.

The development of electricity for power purposes and the dynamo for its generation has all happened within about 40 years. Hjorth's dynamo, the forerunner of this type of machines, appeared in 1855. In 1866 Wilde produced his dynamo with permanent magnets to excite the coil-wound field magnets of a large machine. The present type of dynamo, which dispenses with permanent magnets, was made by Siemens in 1869. Since then all the work of Weston, Brush, Thomson, Houston, Edison, Westinghouse and the other great mechanics who have contributed to the perfection of the dynamo and the utilization of electric currents has been done.

The first electric railway was built in 1879; the first in the United States in 1885. The electric motor was an accidental development from the dynamo in 1873. Considering the present magnitude of the electrical development and its relation to civilization, the newness of it all is startling, even to those of us who witnessed its tentative beginnings and wondered what potentialities of practical usefulness might reside therein.

Electric lighting is still newer. The practical arc was born in the Jablochkoff candle of 1877. The arc lamp of the modern type was developed between 1878 and 1883. For the first incandescent lamp we waited until 1883.

The telephone, which perhaps more than anything else has revolutionized modern business methods, reached the domain of the practical about 1876. That in less than 20 years it would leap from the status of a scientific toy to that of an instrument of universal utility not even the most optimistic prophet would have ventured to predict. It is of interest to mention in passing that for several years after the telephone had come into general business use it was refused admission to the office of *The Iron Age* on the ground that it was liable to be used as a vehicle of misleading trade information and that its easy facility might be abused by designing persons to the injury of others. This reasoning was probably good at the time, but would not carry conviction to-day.

Hydro-Electric Power in India.

The Government of British India has for some time pursued a broad-minded policy in developing the latent possibilities of the immense and valuable country over which it exercises sovereignty. The first notable project undertaken for the generation and distribution of electricity was that of the Cauvery power scheme, in Mysore. Work on this plant was started in 1900, the initial installation being finished after many difficulties in June, 1902. About a year ago the second extension of the plant, consisting of 3,610 kw. generator capacity, was completed. This increased the possible output of the entire plant to 7,920 kw., making it the largest hydro-electric installation now operating in southern Asia. The chief credit for the completion of this power plant is due to Major A. J. de Lotbiniere, Deputy Chief Engineer of the Government of Mysore, who not only conceived the plan of the installation, but successfully arranged for the financing of the entire project.

The power scheme next to be undertaken is on the Jhelum river in Kashmir, northwest India. This power plant is to be installed near Rampur, about 50 miles below Srinager, where a six-mile conduit will give a head of water at the plant of about 400 ft. The present plans call for an installation of about 20,000 h. p. It is planned to use the power for operating the Kashmir section of the Jhelum Valley railway electrically along its entire length of 180 miles. A single-phase system of traction will undoubtedly be installed. Possibly the most important immediate use to which the power will be put will be in operating dredgers for the purpose of deepening the Jhelum river in the Kashmir Valley, and thus minimizing the floods, which, under existing circumstances, devastate the entire country.

After successfully completing the preliminary arrangements for carrying on this important work, Major de Lotbiniere was instructed to proceed to Europe and America in order to interview the leading hydraulic and electrical manufacturers, and to ask those selected to bid upon the machinery and materials for the plant. As a result of this investigation he recommended to his Government that the contracts for the entire hydraulic and electrical equipment be placed with firms in the United States. The contract for the hydraulic equipment was awarded to the Abner Doble Company of San Francisco, and calls for the hydraulic plant complete from the forebay to the tailrace, including the intake, valves, pressure pipes, pressure-pipe thrust blocks, interior piping, water-wheels and nozzles, hydraulic governors, and all details necessary for the hydraulic equipment. The apparatus and materials are to be delivered at the Port of Karachi, India.

The gravity conduit line for the power plant will be 34,000 ft. long, the upper 8,500 ft. to consist of an excavated ditch lined with masonry. The remaining portion of the water channel will be a rectangular flume, or a wooden stave pipe, such as has been installed so successfully in connection with plants of this character on the Pacific Coast. The flume will have a capacity of over 500 cu. ft. per second. The pressure lines will consist of riveted steel pipes designed with a factor of safety of five, each supplying one of the hydro-electric units. For each pipe line a standpipe and two special vacuum valves will be provided in order to protect the pipe against injury in case the water should be drawn out suddenly. At the lower end of each pressure line the last length of pipe will terminate in a flange, which will be bolted to a massive cast-iron thrust-block that will rest on a heavy cast-iron sole-plate or base. The latter will be mounted on a substantial masonry foundation and held in position by anchor bolts. This fitting will be designed to take the entire hydraulic thrust of the pipe, an ample factor of safety being allowed, so that under the most severe conditions there will be no strain on the branch piping in the interior of the power house. Each pressure line will consist of a riveted steel pipe varying in diameter from 30 to 36 in., and a 54 to 36-in. taper pipe, 10 ft. long at the upper end. The pipes will be 790 ft. long and will deliver the water under an effective head of 400 feet.

Twelve main units and three exciter units have been planned for the equipment of the power house. Each main unit will consist of a Doble tangential water-wheel, with automatic oil-pressure governor delivering 1,765 brake h. p. to the shaft, under an effective head of of 400 ft. Each wheel will be direct connected to a 1,000-kw. alternator, the speed of the unit being 500 rev. per min. The exciter units will each consist of a Doble tangential water-wheel, delivering 285 brake h. p. to the shaft under an effective head of 400 ft. The speed of the exciters will also be 500 rev. per minute. The water-wheels will be equipped with ellipsoidal buckets, needle-regulating nozzles and centrifugal water-guards. The regulation of the main units will be effected by means of hydraulic governors operating jet-deflectors. For the exciter units hand regulation will be provided by means of the needle nozzles. The gate-valves for each wheel will be of special construction, with outside screw and yoke, bronze-mounted, with by-pass.

The conditions under which the plant will be installed are decidedly out of the ordinary as compared with similar work in this country. The specifications for the electrical and hydraulic equipment stipulated that no single piece of machinery should weigh more than four tons when packed, for the reason that there is 200 miles of road transportation, including a lift over a range of mountains 8,000 ft. high. Transport in that region is limited to bullock cart, and no single piece of machinery heavier than four tons can be transported, a total of five tons including the trollie (cart) being the maximum weight that can be hauled over the mountains. Portland cement costs $7.50 per bbl. delivered at the site, making its use prohibitive for heavy concrete work. However, there is plenty of natural rock in the vicinity, so masonry construction will be used for the walls of the power house and for foundations.

THE PROSPECTOR.

The rock samples from Salome, Ariz., marked 'Martinez,' are all of the same kind of rock—syenite. No. 1 is completely kaolinized. No. 2 is also kaolinized, but still shows much iron oxide from decomposition of the hornblende. No. 3 is nearer the normal rock, but is much decayed. The hornblende and feldspar are still showing plainly.

The rocks from Phillipsburg, Mont., marked 'P. C. W.,' are: No. 1, two pieces, one of which is a fine-grained mixture of quartz and feldspar—aplite; the other is dolomite; No. 2, an aggregate of talc scales and calcium carbonate, carrying pyrite and chalcopyrite; No. 3, a brecciated crystalline limestone.

The ore from Granite, Or., is quartz with pyrite, galena and a little zinc blende. The more silicious portions of this ore should concentrate readily on jigs and tables. The ore probably contains gold and silver.

The rock specimens from Multnomah county, Or., are andesite, a volcanic rock. The yellowish powder is iron oxide, due probably to the oxidation of a micaceous mineral, like biotite, or one of the pyroxenes, like enstatite or hypersthene.

The rocks from Holmes, Wyo., are: No. 1, a leucite rock similar to phonolite; No. 2, syenite; No. 3 very much decayed, but probably also syenite.

The rock specimens from Red Rock, Ariz., have been classified as follows: No. 1, quartz-porphyry, in which may be seen quartz, plagioclase feldspar, hornblende and epidote, the latter resulting from the alteration of hornblende. The presence of considerable pyrite suggests the possibility of the rock coming from the vicinity of a vein or ore deposit. No. 2 is a dike rock; No. 3, also a dike rock similar to No. 2, but less decomposed; No. 4 is a volcanic rock (trachyte); No. 5 is granite, consisting of pink feldspar (orthoclase), quartz and black mica (biotite); No. 6 is quartz-diorite; No. 7 is pegmatite; No. 8 is a feldspathic dike rock.

In sending samples of ores, rocks and minerals to 'The Prospector' department for determination it is necessary that the following be remembered and observed: 'The Prospector' makes no assays, or analysis, but determines samples by simple means. Advice and suggestions will be given as far as possible, where requested. All samples must be accompanied by the name of the sender and the locality from which the sample came, together with such explanatory notes as seem advisable to the sender. Each sample should be carefully wrapped in paper with a tag within bearing a number, by means of which it may be identified. Samples of fine materials or those which crumble readily should be put in tin or wooden boxes, preferably the latter, as sometimes they are destroyed in the mails, owing to their friability or softness. Hard rocks and ores need only be wrapped in paper of any kind and accompanied by the number and locality. Where there is more than one piece they may be sent in a canvas bag. Very small samples are usually more difficult to determine than larger ones, as often a portion of the sample must be destroyed in making tests. No replies by mail need be anticipated. The result of examination will be found in the Prospector department, and if the samples have been sent as directed above, there will be no difficulty about the sender being able to recognize the description of his samples. The determinations in the prospector are made for subscribers to the MINING AND SCIENTIFIC PRESS only.

The rocks from Vanderbilt, Cal., are: No. 1, mica schist; No. 2, quartz with considerable micaceous iron disseminated through the rock; No. 3 (gray), andesite; No. 4 (black), augite andesite; No. 5, limestone, slight stains of copper; No. 6, quartzite.

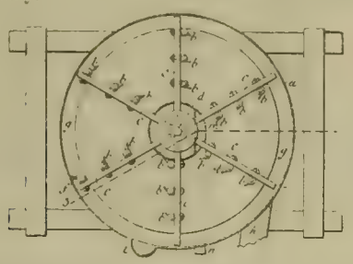
The specimens from Los Angeles, Cal., marked 'A. G.,' are: No. 1, satin spar (gypsum); No. 2, calcium carbonate.

Mining and Metallurgical Patents.

PATENTS ISSUED DECEMBER 26, 1905.

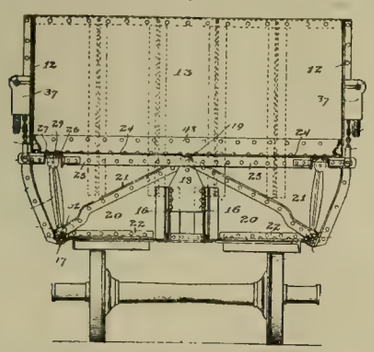
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

APPARATUS FOR TREATING AND AMALGAMATING METALS.—No. 808,787; G. P. Tyars, Cape Town, Cape Colony.



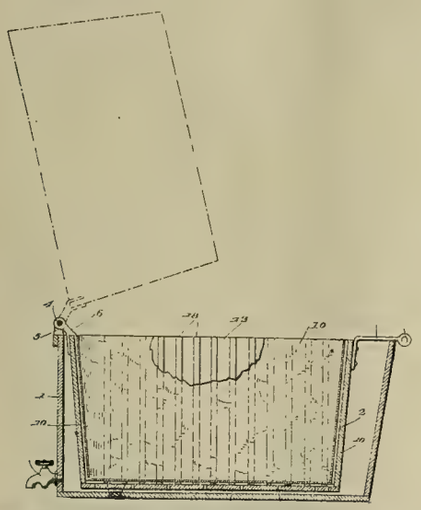
The combination of a vessel for treating and amalgamating ores, a shaft in the vessel carrying arms, paddles depending from the arms and arranged in a spiral around the vessel, the blades of the paddles being set at the same angle to the radii of the arms and so arranged that the leading edge of any blade traces out the same path as the outer rear edge of the preceding one, and a channel extending around the outer edge of the bottom of the vessel.

DUMPING CAR.—No. 808,750; F. M. Hubbard and C E. Taylor, Chicago, Illinois.



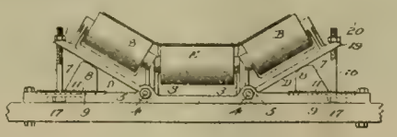
In a dumping car, the combination with the side and end walls of a car body and a suitable supporting underframing, of a car bottom composed of floor sections hinged to the underframing along the longitudinal median line of the car bottom, displaceable strut members hinged to and supporting the outer side margins of hinged floor sections in a horizontal load-carrying position, means for tripping and throwing inwardly the lower ends of hinged strut members, and means for raising and lowering the outer side margins of hinged floor sections between load-carrying and load-discharging positions.

LEACHING TANK.—No. 808,675; A. B. Mouck, Twisp, Washington.



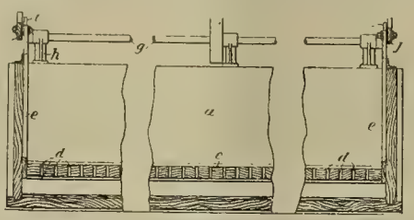
The combination with a reservoir or tank, of a leaching tank pivotally suspended therein and held out of contact therewith and adapted for dumping movement, tank comprising a plurality of compartments each having a perforated bottom, slats or spacers secured to the four walls and bottom of each compartment, and a filtering medium disposed within each compartment and held out of contact with the walls and bottom thereof by the slats.

CONVEYER BELT SUPPORT.—No. 809,227; A. W. F Steckel, Columbus, Ohio.



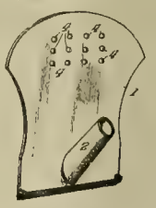
In a conveyer, a belt support consisting of combination of two inclined pulleys, a movable carrier for each pulley operable up and down in planes transverse to the belt, an intermediate support for the belt independent of pulleys, and means for operating carriers to adjust inclined pulleys relative to intermediate support.

APPARATUS FOR THE AGITATION OF SOLUTIONS USED IN ELECTRO-DEPOSITION OF METALS.—No. 808,798; W. C. Wood and B. Oaksford, London, England.



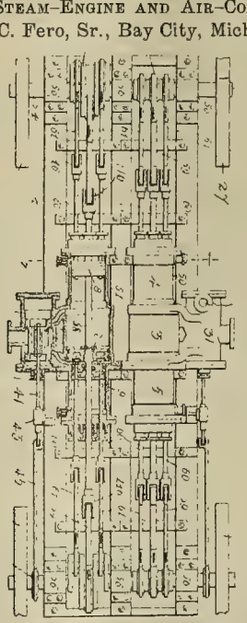
In an apparatus for the electro-deposition of metals, the combination with the tank for containing the electrolyte of a trough arranged within the same, the trough having within it a plunger designed for drawing the electrolyte into the trough and ejecting it therefrom.

MINER'S LAMP SAFETY SHIELD.—No. 809,111; R. I. Jenkins, Lewistown, Montana.



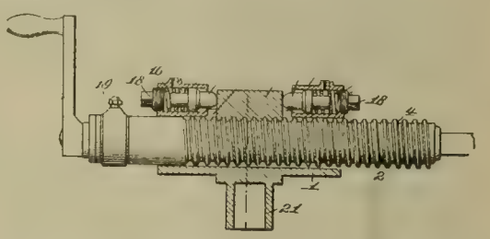
In a shield having a plurality of openings near its upper end and an opening near its lower end, a sleeve surrounding said opening, a trough carried by the lower end of the shield, a horizontal flexible projection carried by the shield at its lower end to hold the same against upward movement, and a semicircular support secured to the back of the shield to hold the same against sidewise or tilting movement in combination with a miner's lamp.

COMBINED STEAM-ENGINE AND AIR-COMPRESSOR.—No. 808,526; C. Fero, Sr., Bay City, Michigan.



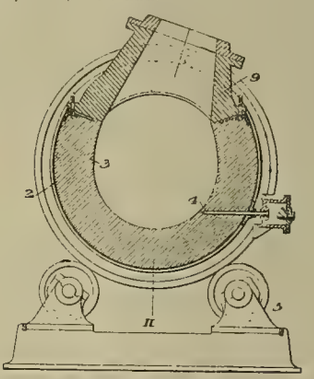
A combined steam-engine and air-compressor, comprising a support, a central cylinder mounted thereon and provided with steam inlet and outlet ports adjacent to its ends, end cylinders having their outer ends closed and their inner ends in communication with the ends of central cylinder, air inlet and outlet valves adjacent to the outer ends of end cylinders, crank shafts, a piston rod for central piston projecting through each of the end pistons and connected to crank shafts, piston rods for end pistons connected to crank shafts, a steam valve for steam inlet and outlet ports in central cylinder, and an operating connection between steam valve and one of crank shafts.

ROCK AND COAL DRILL.—No. 808,837; L. C. Hardsocg, Ottumwa, Iowa.



In a drill, a housing, a hammer mounted therein and provided with exterior screw threads, a slidably mounted hinged block having screw-threaded engagement with hammer, spring-pressed plungers located at opposite ends of block for cushioning the movements of the same, means for adjusting the tension of the springs of plungers, and means for turning hammer.

METHOD OF CONVERTING MATTE.—No. 808,618; C. M. Allen, Lolo, Montana.



The method of converting matte, which consists in bessemerizing in a converting vessel having a non-silicious interior, a charge of molten matte until it reaches the grade of white metal, then transferring it to a smaller silica-lined converter and finishing the bessemerizing therein.

A New Gasket.

The ever-increasing steam, water, air and gas pressures call for improvements in joint connections to withstand the highest service. Such joints must be absolutely tight under any pressure. They must be quickly made and taken apart. The joint should be as thin as possible; it should not leak when cold or hot, or from unequal expansion. The gasket should not cause electrolysis. Therefore, on iron pipes, a gasket composed of iron should make the best joint. The attention of engineers is called to a corrugated iron gasket coated thinly with a special iron cement that appears to fill these requirements, and is said to make the thinnest and strongest gasket in use and the nearest to a ground-joint. It is as durable as the pipes it connects, as well as one of the cheapest gaskets. The active principle of a slight expansion found in these gaskets when made up makes the connections tight and strong, which is not obtained in inert or dead material commonly used for such purposes. These gaskets are manufactured by the Smooth-On Manufacturing Co., at Jersey City, N. J.

Commercial Paragraphs.

THE Salt Lake City branch office of the Allis-Chalmers Company will be removed after January 10 to the Dooly Building, 117-119 East Second South street.

CONTRACT has been closed for two 'Hornsby-Akroyd' oil engines, 16 h. p. each, built by the De La Vergne Machine Co. of New York, for the Golden Key Mining Co., Hillside, Arizona.

THE Chicago Pneumatic Tool Company state that arrangements are under way for increasing the capacity of their compressor works at Franklin, Pa., so as to give them an annual output of between 650 and 700 compressors.

THE Robins Conveying Belt Co. has opened an office at 749 Railway Exchange Bldg., Chicago, Ill. C. K. Baldwin, the chief engineer of the company, is in charge of this office and is prepared to handle all inquiries from parties located in the Middle West.

MINING SUMMARY.

Specially Compiled and Reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

The Alaska bismuth mine, 40 miles northwest of Nome, will be opened up next May, and the first shipment will be made out of the north country on June 15. ——Two large cargoes of concentrates, aggregating 2,500 tons, are en route from the Treadwell mines, on Douglas Island, to the Tacoma smelter.

ARIZONA.

(Special Correspondence).—The action of President Roosevelt in regard to fake mine promoters throughout the country has been received with satisfaction in Arizona. In the past a large number of these fakirs have operated in this Territory and have been a serious menace to legitimate mining. However, at present, we have but very few of them, and trust that their number will be still less from now on.——Mining throughout northern Arizona in all its branches was never more active than at present, with the advent of the new custom smelter at Humboldt, with the discoveries on Bill Williams Fork and general activity throughout the mining districts things are looking brighter than for some time past. Mining on the Bill Williams Fork, where the recent discoveries were made, is demanding many miners, and before winter is passed hundreds of men will be employed by the big companies going in there. Many hoisting plants are being put on the various mines, as the shafts are getting below the depths where whims and windlasses can be used to advantage. The mines are all showing up well. The Arizona Smelting Co. at Humboldt, Yavapai county, is getting its lead stack ready to blow in, the copper stack having been completed. The plant will handle 800 tons of lead and copper ore daily. Its agents have been very busy for several months past buying ore throughout northern Arizona, and large amounts are now being shipped awaiting the beginning of operations.——Silver ore running as high as $1,000 per ton has been found in the Carrollton mine, near Dewey, at the bottom of the 150-ft. shaft. The vein measures from 6 in. to 4 ft. and carries native silver and chloride of silver. It also carries 1.25% copper and the same amount of lead. The claim is a contact vein lying between porphyry and granite. The strike was made where the vein cuts a porphyry dike. In sinking the shaft, Mr. Carroll found iron tools of primitive patterns, which he believes were left by the Spanish expedition that explored Arizona in 1539.—— The Gold Bullion mine, near Old Glory, Santa Cruz county, has been sold for $25,000; it is understood that $100,000 will be spent in development work.——The Great Republic mine, Yavapai county, has made a strike in a crosscut that was being run from the 700-ft. level; the ore is practically solid copper sulphide.——Ore carrying gold, silver, lead and copper has been struck in the Senator mine at Paradise. The Empire State also got 5 or 6 ft. of the same kind of ore on the 100-ft. level.——The Gold Lode Mining Co. has nearly finished a 10-stamp mill and three concentrators. They have 2,500 ft. of development done, exposing ore much of which averages $40 per ton.——Work on the Rainbow mines, near Turkey creek, will begin at once. One shaft is down 40 ft. and is in solid sulphide.——The annual meeting of the Arizona Mining & Milling Co. was held in Prescott, January 10; officers were elected and arrangements completed for starting work. The properties owned by this company are in the Santa Maria district. ——The United Verde Company of Jerome, Arizona, has purchased the shafting, Corliss engines, rails, cars, etc., which were a part of the plant of the Albemarle Mining Company's cyanide mill at Bland, New Mexico, for $18,000. This machinery will be moved to Jerome where it will be used in the construction of a new mill for the United Verde Company. It is stated that the Blue Leaf group in Black Rock district will be taken up by an Eastern syndicate.——The fight that has been waged for more than a year among the officers and stockholders of the American Copper Co. has reached the Supreme Court of Arizona. This company had been declared insolvent in the District Court of Yavapai county, and some of the stockholders have petitioned the Supreme Court for a review of the bankruptcy proceedings, claiming fraud.

Prescott, Jan. 13.

Cochise County.

The Arizona & Michigan Development Co. is developing the Copper Chief mine, in the Little Dragoon mountains, near Wilcox. President A. J. Pidgeon is at the mine.——The Black Diamond Co. is working its claims near Pearce.

Graham County.

It is expected that the Sierra de Oro Gold Mining & Milling Co's. tunnel near Clifton, now in 1,500 ft., will strike the main lead in 275 ft. F. B. Eldridge is president.

Mohave County.

The Benedictine Mining Co., with properties near Cedar, have put on a tank wagon service between the mines and Yucca to haul fuel oil for use at the mines.

S. R. Rhea and others have taken a lease on the Tennessee mine, near Kingman, and will unwater it and begin mining in the old stopes and lower levels. The water from the mine will be used in the mill. When the mine is unwatered, water will be obtained from the Empire mine, owned by the same company. It is probable that a zinc separation will be made in the mill, as well as saving the values in lead. High-grade zinc tailings are in the pits at the mill.

Pinal County.

W. B. Twitchell, general manager of the Big Lead Mining & Smelting Co. near Kelvin, is arranging for machinery for a 100-ton concentrating plant.

The Newbury Mining Co. is preparing to resume work on its properties near Florence. C. M. Schofield has paid $5,000 of the concern's debts.

Yavapai County.

The Rigby Mining & Reduction Co. has completed its plant, using the Pohle-Croasdale volatilization process for the extraction of minerals, and is making its experimenting run. The furnaces have a daily capacity of 150 tons.

The Hite Gold Mining Co. has bought the King Solomon's mines, near Martinez, from J. Ellis for $35,000. R. J. Rice is manager. A hoist is to be put in and development pushed.

CALIFORNIA.

Amador County.

The copper mine, owned by Mr. Thayer of San Jose, Lancha Plana, is being equipped with a hoist, to be run with water power.

An electric pump is being put in at the South Eureka mine, near Sutter Creek, designed to pump 2,030 ft. on the incline or 1,800 ft. on the vertical, handling 100,000 gal. per day. This will aid in draining the Central Eureka mine.

Calaveras County.

Work has been started at the Josephine mine on the San Antone, 7½ miles from San Andreas, by Thomas Shearer, George E. Walker, et al. A 3-stamp quartz mill has been purchased and will be put in.

El Dorado County.

The parties who have the Snow mine at Newtown have an incline shaft down 50 ft. and have struck gravel.

A stamp-mill is being torn down and moved from the Lady Emma mine at Kelsey to the Reese & Roemke mine at Spanish Ranch. The lessees of the mine have decided to equip and operate the mine. Fred Schmeder will set up the stamp-mill.

Fresno County.

G. W. Ade, trustee for the Copper King mine, near Clovis, states that work is being done at the mine. They are sinking a shaft from the 600-foot level to the 700-foot level. All the preferred labor claims have been paid.

Humboldt County.

The Legal Tender Dredger & Placer Mining Co. and the National Statutes Dredger & Placer Mining Co. have filed locations on the Klamath river, between the forks of the Trinity and the Salmon, near Orleans.

Inyo County.

It is reported from Keeler that the 150-ton smelter that is being put in to treat the tailings of the old Coso-Gorda mine will be ready by the 15th of February.

Kern County.

P. H. McMahon, superintendent of the Butte Lode mine near Randsburg, states that he mined and milled during December 75 tons of ore, which plated at the Red Dog mill $6,600, leaving in the tailings $12 per ton.—— The Papoose Mining Co. has men at work on the Papoose tungsten mines taking out rich ore. They will soon ship another carload.——The Gold Coin and Stanford mines, near Randsburg, are working a full force. The ore mined is being milled at the Red Dog mill under the management of Frank Mann.

Los Angeles County.

E. Reid, one of the stockholders of the Borland Mining & Milling Co. at Silverado, 24 miles from Santa Ana, states that his company has determined to build reduction works on its property.

Mariposa County.

The owners of the Three Trees mine, five miles north of Hornitos, have sunk an incline shaft 175 ft. A hoist, two-stamp mill and equipment for electric power are being put in. Power will be obtained from Merced Falls. The operators are Morrell & Jacobs of Oakland, and others.

Mono County.

A contract has been let to Gillis & Mitchell to sink the shaft 50 ft. deeper at the Pittsburg mine. When the 150-ft. level of the shaft is reached, the force will be increased and crosscuts and drifts run.

Nevada County.

The South Yuba Water Co. has notified all the mines of Grass Valley and Nevada City that there is now sufficient water available so that they can resume work with full forces.

The new electric trolley line built by the North Star near Grass Valley has been completed. The line is two and one-half miles long and connects every department of the Central and North Star mines. It will carry ore from the Central shaft to the North Star mill and thence to the cyanide plants. In addition to this it will convey iron, ore or any material to any part of the mine. It will take the place of several teams which have been hauling between the two mines.

The North Bloomfield, Milton and Eureka ditches in the upper part of the county, which were blockaded for several days on account of the big storm, have been reopened and the water is running again as usual. The Union Blue and Malakoff mines at North Bloomfield, which were compelled to shut down for a few days because of the failure of the water supply, are operating as usual.

The new electric hoist to be put in at the Central Consolidated mine has arrived at Nevada City.

Superintendent A. A. Charonnat has been making arrangements for a resumption of work at the Banner gravel mine and the Charonnat quartz property, near Nevada City. The Banner gravel claim is worked through a tunnel and the channel will be further explored. The incline shaft at the Charonnat will be unwatered and when the bottom is reached sinking will be commenced.

The heavy continuous rains are filling up the reservoirs and ditches in this county, and every mine which has been suffering for lack of water is running full blast. ——The new mill at the Oustomah, at Nevada City, has been started for the first time since it was completed.—— The Home, Lecompton, Sierra Queen, Blue Tent, Delhi, Murchie and Champion have started, but the Mountaineer will not attempt to reopen for some time.—— The shaft on the Woodberry mine, on Osborne hill, is now down a distance of 210 ft. on the incline.

The new air compressor at the Spanish Ridge mine, near Washington, is furnishing power for the air-drills in the mine.

Plumas County.

The Red Mountain Consolidated Gold Mining Co. has acquired the properties of the Rappahanock company in French ravine, near Spanish Flat, as well as the Sheldon and other properties, and will develop them under the direction of Mr. Woodrum.

Shasta County.

B. F. Rogers has started work at the South Fork and Chicago mines, north of Igo. A 2,350-ft. tunnel has been driven on the South Fork.

The Great Western Gold Co. will put in a second and larger furnace at the Ingot smelter and will erect a zinc plant in which zinc white will be produced from the fumes of the smelters. M. E. Dittmar is managing director.——At the annual meeting of the Redding Gold & Copper Co., the following directors were elected: H. D. Irwin, president; T. M. Gilbert, vice-president, Thomas Gilbert, secretary. The directors have arranged to install a power plant and custom smelter this year.

Sierra County.

The Twin Eagle quartz mine at Kanaka has been bonded to the Empire Gold Mining Co. operating at Gold Valley. John Reid has charge of work.——The Rainbow mill, near Alleghany, is running 10 stamps. F. Low has charge.——The Swansea mine, near Alleghany, has been started by J. Brock.

Siskiyou County.

The King Solomon mines, near Cecilville, Liberty mining district, will be equipped with a milling plant and other machinery as soon as the road is built from Black Bear.

The Pittsburg Gold Mining Co. (the New Hope mine) is putting up a quartz mill, a boarding-house and bunkhouse and will put in a hoist, pump and electric machinery. Paris Mathewson is superintendent.

Sonoma County.

The big dam built last year by the Socrates Mining Co. on Sulphur creek was washed out on Jan. 11. The dam was 40 ft. high, spanning Sulphur creek, and was 30 ft. in width. It furnished water for the electric power plant, which cannot be used until the dam is rebuilt.

Tulare County.

At the Redfield Mining Co.'s mine, the Last Chance, near White River, under Superintendent Anderson, a shaft has been put down 200 ft. and two levels are being run from the bottom of the shaft.

Tuolumne County.

The Mack mill, near Big Oak Flat, has been started. —— Grading at the Longfellow mill, near Big Oak Flat, for an additional 10 stamps, is being done for a 25-stamp mill.

The south shaft of the New Albany mine, north of Carters, is to be opened. As soon as the water has been taken out of the shaft a power pipe line will be put in. The property was lately deeded to Chas. Y. De Lay.—— The shaft of the Black Hawk mine, near Soulsbyville, will be sunk to a depth of 180 feet.

COLORADO.

(Special Correspondence).—The State Supreme Court has dissolved the injunction granted by Judge Owers of Leadville in the case of the Western Federation of Miners against the Mine Operators' Association of the Leadville district, enjoining the operators from enforcing the card system. The injunction is dissolved until the court can pass upon the merits of the case. The card system as employed in several camps of the State is to the effect that no one shall be employed in or around the mines without the party first registering with the Operators' Association and receiving a card, which permits them securing employment. This has been considered a rather vicious measure adopted by the operators, but they claim it is to get rid of, as far as possible, the disturbing elements usually found in the districts. The system is said to be in successful operation in the Cripple Creek and Telluride districts, and will probably be enforced in Leadville.——With the exception of the San Juan district the snowfall throughout the State is below the average for this time of year.

Denver, Jan. 15.

Boulder County.

(Special Correspondence).—Mining in this district is improving and during the coming summer a large amount of development work will be accomplished. The tunnel in the old Brunswick property is to be driven 250 ft. farther.——The New York Mining & Milling Co. intend driving their tunnel 1,000 ft. farther. This mine is equipped with power plant.——The Wano recently made a good strike of calaverite, which is the first strike of the kind made for several years.——On the Invincible a good streak of high-grade free gold ore was recently opened up.——The Copper Blush intend sinking their shaft 200 ft. deeper. The work was started by contract but was abandoned and now will be done by day's work. ——The Buchanan is being opened up by Philadelphia people.——The Standard people expect to start operations on the blanket vein on their property. It is reported a 100-ton mill will be put on the property.——The Ellen mine has been opened up by leasers, who are sinking. ——The Boulder Reduction Co. is completing tests on the Red Spruce ore and doing custom work in the mill on ore mostly from the Invincible mine.——A large tunnel scheme is now under way for this district, and consolidation of several properties is being considered.—— The shipping of fluorite to the steel works at Pueblo has again commenced. This is the only deposit known in the State that will pay to ship.

Jamestown, Colo., Jan. 11.

Gilpin County.

The American Tungsten & Mining Co. has secured a two-year bond and lease on the Walter A. No. 1, 2 and 3 claims in the Kansas district, north of Boulder park, near Central City.

Gunnison County.

A controlling interest in the Camp Bird property at Bowerman has been sold by the Gold Cross Mining & Milling Co. to F. A. Wilson and Boston capitalists for $35,000. The Camp Bird group embraces 200 acres and is ore of the first discoveries in the Bowerman field.

Lake County.

(Special Correspondence).—A. V. Bohn, who has been operating in Big Evans gulch, is reported to have opened up good ore on the 500-ft. level. It is believed this strike will be the means of much activity in this locality.

Leadville, Jan. 13.

It is planned to put in an electric plant to be run by water power from Willis gulch, near Twin Lakes, to run the air compressor and contemplated mill of the Manhattan mine.——Rich gold-copper ore is reported to have been struck in the Highland Boy claims, on Bull hill, by H. Medaris and F. Ryan of Twin Lakes.

After putting a pump at the 550-ft. level, the Mammoth shaft, in Big Evans gulch, Leadville, has resumed sinking. Water is coming in through the lime.——The Dome shaft, Rock hill, is sinking another lift. The shaft is down 85 ft. below the 200-ft. level.

Ouray County.

The Colorado Supreme Court has handed down another opinion on the mining tunnel question, in the case of Frank P. Tanner *et al.* against the Treasury Tunnel & Reduction Co. of Ouray. The case involves the right of one mining company to tunnel through the property of others. The Supreme Court held that this right exists under the law of eminent domain. It went even further and said that a tunnel so constructed may be used by other companies as a sort of quasi-public highway. Parties causing the construction of such a tunnel must pay the owners whose property it pierces for the ore taken out, and parties using such tunnel afterward must pay a reasonable sum for such privilege. The Treasury Tunnel, Mining & Reduction Co. wished to bore through the Corn Cob lode, owned by the plaintiffs in error. Litigation followed, which resulted in its favor, and an appeal was taken. In the decision Chief Justice Gabbert wrote: "For the development of the mining resources of this State, tunnels of the character contemplated by the petitioner are necessary. The necessity of vesting corporations of the character of petitioner with the right to exercise the power of eminent domain is apparent, for without this enterprises of the nature contemplated by the petitioner could be thwarted and the development of the mining resources of the State prevented. The use and benefit of this tunnel will be in common, and all parties located near may avail themselves of it."

San Juan County.

At the Fairview and Thunder mines, on Sultan mountain, south of Silverton, under the supervision of George H. Bibb, the tunnel is being driven to intersect the Fairview vein.——According to Superintendent T. R. Hennahan, the North Star mill, on Sultan mountain, south of Silverton, may be started the first of February. The Belcher vein, upon which they have been driving for three years, will soon be reached. In the meantime drifting on the Eunice, Sound Democrat, O'Neill, Washington and Jefferson veins is progressing and good milling ore is being stacked on the dump.

The new zinc separator at the Sunnyside mine, near Silverton, has been completed and is in operation. The mill is equipped with the magnetic separators, which are producing zinc concentrates. The Sunnyside mines have been sold to the Ross Mining Co., who will take charge February 1.

San Miguel County.

M. Mongrandi has taken a lease on the No. 1 level of the Butterfly-Terrible mine at Ophir Loop. His product will be treated at the company's mill by the company. The company has stopped work on their lower tunnel, with 100 ft. to run before cutting the vein. A number of small leasers are working in the lower levels. ——John W. Wagner is constructing an aerial tram 700 ft. in length from the mouth of the tunnel on the Bradley to the Cimarron mine, near Telluride. The Cimarron mill is being remodeled and will be fitted with 40 1,360-lb. stamps and have a capacity of 500 tons per day. It will be run on Cimarron and Bradley ore.

Teller County.

A strike is reported on the Mary Nevin claim, on Rosebud hill, near Victor. The ore shoot opened in the Banner six weeks ago has been found in the Mary Nevin at a depth of 300 ft.——At a depth of 400 ft. in the No. 2 shaft of the Stratton's Independence, in the Russell lease, a gold discovery has been made.——John Sharp of Cripple Creek has secured a lease on the Rose Maud claim, on Raven hill. The shaft is 240 ft. deep.——The Acacia Gold Mining Co. of Cripple Creek have elected the following officers for the ensuing year: K. McKenzie, president and manager; W. J. Chinn, vice-president; K. McDermid, secretary and treasurer. Lease on the South Burns ground was issued to H. H. Clark and associates of Cripple Creek. The lessees are required to continue the shaft to the 1,000-ft. point within eighteen months, which means the addition of 550 ft. Contract for 300 ft. of this work has been let and work will begin at once. The lessees are also required to pay a royalty of 30% flat on all ore shipped. Management of the leasing company has been placed in the hands of C. N. Crowder.

General Manager C. M. Becker of the Stratton's Independence, Ltd., has given notice to all of the 36 sets of lessees now operating that the present blocks are to be cut in two. The other 36 blocks will then be leased, making the company have more lessees than any other property in the camp. The size of the blocks heretofore has been 300x600 ft. The new order goes into effect February 2, at which time all leases expire. This company, since it inaugurated the leasing system, has only given leases for a period of six months. The Stratton's Independence is maintaining a heavy tonnage of ore and the average value is good. The 36 sets of lessees shipped out during December 3,000 tons of ore and the value per ton on an average was $35. The company has considerable ground that has not been exploited and the new lessees will probably do this work. The mine has been a success under the leasing system.

The big strike of ore recently made on the south end of the Dante, at Cripple Creek, by Becker & Briggs, has proven permanent. The ore was found in the lower Trail tunnel, 475 ft. below the surface. They have opened up a chamber of ore that appears to be the junction of the vein. It is 20x20 ft. in size, with ore showing on every side, as well as in the roof and floor. The lessees intend to make an upraise of 150 ft. to connect with a winze sunk from the surface. When the raise is made machinery will be put in and sinking started in the ore below the Trail tunnel level. A depth of 200 ft. will be made immediately. A motor car is to be put in to haul the ore out of the tunnel, as the rock is being broken at over 2000 ft. from the portal.

IDAHO.

Robert N. Bell, State Inspector of Mines for Idaho, gives the following estimate of the gross metal contents of concentrates and crude ore shipments from Idaho mines during 1905: Gold, 61,694 oz., value $1,275,214.98; silver, 9,009,230 oz., value $5,432,565.69; lead, 262,631,632 lb., value $12,868,449.96; copper, 6,670,000 lb., value $1,040,520; zinc, 2,150,000 lb., value $124,700; total, $20,741,950.63.

Ada County.

The Equitable Mining & Milling Co., which is developing claims in the Black Hornet district, near Boise, is driving a crosscut tunnel. Superintendent B. B. Jones has given orders for a tank for a cyanide plant to be put in for experimental purposes. There will be three of these, of 50 tons capacity each. He has also ordered the pumps needed for the plant.

Idaho County.

The Seattle & Idaho Co., of Dixie, is preparing to put in a 60-ton concentrator to replace the present 4-stamp mill. The ore has been found amenable to the cyanide process.

C. W. Smith reports the Anaconda mine, at Newsome creek, to have been operating a 5-stamp mill since Nov. 5 and that it is making regular cleanups which show good results. The mine is owned by the Graham-Ross Co.

Kootenai County.

New hoisting machinery has been purchased and delivered and considerable development work is being done on the property of the Lane Gold Mining Co., one mile east of Lane, on the Tekoa-Burke branch of the O. R. & N.

Latah County.

A. J. Hoskins of the Muscovite mica mine, 15 miles east of Troy, intends working 75 men in the spring.

Shoshone County.

It is expected that the Helena-Frisco mine at Gem will resume operations with 200 men. Gus Ehrenburg has men arranging to pump the water from the mine, preliminary to beginning mining operations. There are about 1,300 ft. of water in the mine. It will take three months to pump it. The owner ceased working it two and a half years ago. Since then the upper levels have been worked under a lease.

The tailings case, in which farmers living in the Cœur d'Alene River valley are suing for an injunction against the various mining companies operating concentrators, to restrain them from permitting the tailings from their plants to flow down the stream to the alleged detriment of the plaintiffs' lands, has been transferred to Cœur d'Alene City. The case has been on hearing before Judge Warren Truitt of Moscow, who was appointed by the Federal Court as master in chancery to take evidence. At Cœur d'Alene City, Dr. McBurney, State veterinarian at Boise, Idaho, and Dr. Bell, Government veterinary surgeon for British Columbia, will be the chief witnesses. Not only do the plaintiffs in the case allege damage to their lands and crops, but they claim that horses belonging to them have been lost through the animals drinking the alleged lead polluted water of the river.

C. F. Smith of Black Bear, who secured a new lease on the three upper tunnels of the Custer mine, is driving a crosscut from the No. 2 tunnel, 1,450 ft. in from the portal, in an effort to locate a lost ore-shoot.—— M. J. Sinclair, W. H. Kane and George Mason, owners of the Surprise mine in the Pine Creek district, near Wallace, will open up the orebody found in the No. 2 tunnel by drifts both ways on the vein, and will probably equip it with a small mill.——At the Leslie mine at Wallace the orebody is being drifted on at a depth of over 700 ft., the ledge having been cut by the tunnel 1,500 ft. from the portal and 500 ft. beyond the No. 1 ledge.

New hoisting machinery is to be put on the Keating property at Wardner.——John Thyne, manager of the Golden Chest mine at Murray, states that the development tunnel started is in 2,400 ft., and is 200 ft. from a point vertical to the Sullivan shaft above.——The Alma Mining Co., on Deadman gulch above Mullan, has resumed operations.

The Hecla Mining Co. has received a part of its machinery for the mill at Gem.

Richard Daxon will sink the winze of the Tarbox mine, near Wallace, from the 400-ft. level to the 600-ft. level. A crosscut will then be made to the orebody.—— The Alameda Mining & Milling Co. is planning to resume the development of its property, near Wallace.——The Morning mill at Mullan has added several vanners to its equipment since the Federal company took over the property and new tailings elevators are to be constructed. These improvements are being made under the direction of George Ruggles. The vanners will save slimes and fines which formerly went to waste. The Morning mine is employing 350 men.

Washington County.

It is stated that preparations for resuming operations at Mineral by the Ladd Metals Co. are about completed, and that a force to work the mines and smelter will be put to work soon.

MICHIGAN.

Houghton County.

(Special Correspondence).—The new shaft of the Tecumseh has reached a depth of 200 ft., and a plat is being cut for drifts at that depth. The shaft is partly in the foot-wall, and no crosscutting has been done to test the lode from wall to wall.——The Osceola management has reverted to the former plan of mining the Osceola amygdaloid as a bunchy proposition, instead of taking practically everything between walls, and the result is apparent in a largely increased percentage of copper secured per ton stamped. The copper is found in bunches, and favors the hanging wall as a rule, but frequently occurs in parallel bunches of rich ground upon both the hanging and foot-walls. As a consequence of this peculiarity of copper occurrence, drifts are carried well toward the hanging, and stoping is done only in the rich ground. This plan reduces dead work in unproductive ground to the driving of a 7 by 7 ft. drift, as compared with the former heavy expense of breaking practically all the rock from wall to wall. The plan of reaching the foot-wall bunches has been, heretofore, to crosscut to the foot from each rich bunch found on the hanging, but this method is to be displaced by diamond-drill borings. An average crosscut from the hanging-wall drift to the foot-wall costs $90, while a drill hole can be bored for an average cost of $30.——The rebuilding of the third section of the Calumet & Hecla mills is well along, and work on the fourth and final section will be undertaken shortly. The remodeling of the two old mills should be completed in 1907, and when the work is done, after four years of steady effort, the company will have three stamp mills, modern in construction and equipment, capable of crushing 10,000 tons of conglomerate, or 15,000 tons of amygdaloid daily. There will be 29 power stamps, of which number one or two will be reserved for experimental purposes, and probably two or three others will be held as auxiliaries, to replace stamps temporarily out of commission. Each of the Calumet & Hecla steam stamps is equal, in crushing duty, to 125 modern gravity stamps of the sort used in milling gold ores. The new mills of the Calumet & Hecla will be equal to a modern gold mill with 4,000 stamps.

Houghton, Jan. 15.

MONTANA.

Beaverhead County.

The Duluth Company, which is operating the Copper Queen in Idaho, over the line from Midway, has a lease and bond on the Park, Old Elkhorn, Washington and Park Extension in the Elkhorn district. They will begin work on the Wise river side of the range and run a tunnel 2,500 ft. to tap the claims at a depth of 4,500 ft. Power will be secured from an electric plant on the Wise river.——T. Taylor, of Dillon, has secured an option on the Blue-Eyed Nell claim, owned by F. B. Williams and T. Haw. This claim is in the Elkhorn district.——At Polaris, the new company has the frame of its smelter constructed and ore bins completed. The company is also operating the Silver King, an iron mine on the hills north of the Polaris. It has a 14-ft. vein of magnetic iron, and will be used in fluxing. Water has recently been found in the shaft in such quantities that a pump will be required.——Encouraging reports come from the Blue Wing district of Beaverhead county. The district is between Bannock and Argenta.——On the Brick Pomeroy, A. Bessette has seven men at work taking out shipping ore.——In the New Departure mine, in the same district, John Marsh and W. A. Jones are leasing and are shipping ore regularly. An air compressor and pump are to be put in.——An effort is being made to have the old Iron Mountain mine in the Argenta district worked. It is owned by the St. Louis Smelting Co. and John Cowan has a lease on the property.

Fergus County.

C. H. Walker, of London, is expected to resume the management of the New Mines Sapphire Syndicate's property at Yogo. Last fall I. F. David was awarded damages against this company for $1,000 for injury done his land and crops through the slums from the mines being carried upon his ranch in the waters taken from the Judith river for irrigating purposes. The ditch carrying waste from the mines empties into the Judith above the intake of the irrigating canals, and under this arrangement, the ranchers below the point of discharge cannot avoid carrying much of the waste upon their lands. On the trial, an injunction was granted restraining the sapphire company from discharging its waste into the river at the point stated. The washing will commence early in the spring. Much work is being done both at the mines of the syndicate, and at the Burke & Sweeney ground, which is now under bond to the American Sapphire company, of New York, for $100,000. The mining operations are being pushed with full forces.

NEVADA.

Elko County.

A snowslide at Edgemont swept away a large quartz mill, completely wrecking it and carrying away bullion which was on the plates. The machinery is being uncovered by a large force.

Esmeralda County.

Additions are being made to the two stamp mills operated by the Mohawk-Alpine company, at Silver Peak ——Bert H. Hummel, manager for the Lida Gold Mining Co., states that a shaft will be sunk on the ledge which was cut in the crosscut tunnel.——The New Western Reduction Co. has placed an order for a new sampling plant, a new 40-stamp mill and a chlorination plant, and plans to have the mill complete and in running order by the first of May.——The Gardner Mining Co. will build a cyanide plant with a capacity of 40 tons per day. Construction work will commence about the middle of January.——New machinery has been added at the American mill at Goldfields.——Ten more stamps, a Bry-

an mill, three vanners, a Wilfley, a 40-ft. tube-mill and three slime-tables are being added to the plant of the Combination Mining Co. at Goldfields.——The Kinkead mill, under construction on the east side of Columbia mountain, will be in running order by the middle of February.

Eureka County.

It is reported that a 50-ton smelter is to be put in to treat ore from the Mineral Hill mine at Palisade by G. L. Kennedy.

Lincoln County.

Material has been purchased by the Good Springs Smelting & Development Co. for the construction and equipment of an electric railway 12 miles long, to run from Good Springs to a mining section north of that city. This will bring ores from the mines and carry workmen to and from their homes.

Nye County.

At the Montana-Tonopah mine, at Tonopah, men are excavating for the new compressor, hoist and steel gallows-frame. The steel gallows-frame is to be put up around the present one and will be completely connected up without disturbing the latter.——The Tonopah Mining Co. has completed its motor drives for its compressors and is using air drills in all its workings.

White Pine County.

The Gold Canyon Mining Co. is running two drifts on the level from the tunnel level at its mine at Cherry creek.——The work of unwatering the Ruth mine at Ely is finished. Arrangements are being made to put 80 men at work.

NEW MEXICO.

Grant County.

The Silver City, Pinos Altos & Mogollon Railroad—a narrow-gauge line that is being built from the Comanche smelter at Silver City to Pinos Altos—is almost completed. In February ore trains will be running over the line.——The Comanche Mining & Smelting Co. is again enlarging the capacity of the smelter on the site of the old Silver City Reduction Works, destroyed by fire two years ago. A reverberatory and blast furnace are ready to be blown in. Ore-bins having 5,000 tons capacity have been built. Construction has been begun on a concentration mill to have 400 tons daily capacity. The zinc concentrating department has contracted its product at $60 a ton for 1906. To handle the copper-silver-gold concentrates, a briquetting plant has been put in. Orders have been placed for magnetic ore separators. The new 250-ton furnace will be blown in early in February. Another furnace of the same capacity is to be constructed this year, after which the old furnaces will be dismantled.

Luna County.

The Phœnix Prospecting Co., in the Cook's Peak district, has taken a bond on several properties.

Otero County.

The Southwestern Co. is opening new ore on the By Chance property at Jarilla. A crosscut will be driven from the bottom of the By Chance mine shaft to get under this orebody.——A tramway is to be built from the Lucky Mine tramway at Jarilla to the other mines and dumps.

Sandoval County.

The United Verde Mining Co. of Jerome, Ariz., has bought the rolls, shafting, Corliss engine, piping, rails, cars and other machinery and equipment of the Albemarle Mining Co., in the Cochiti district, for $18,000. The machinery is to be freighted to Thornton and shipped to Jerome.

Socorro County.

William S. Bourne and L. R. Lamy of Nogal are interesting Kansas capitalists in several zinc and lead propositions in the San Andreas mountains.

OREGON.

Baker County.

C. G. Green, of Durkee, has sold to C. W. Thompson, of Portland, and F. T. Sutherland, of New York, the Blue Bucket, Marcus Daly and Golden Gate quartz claims and the Golden Gate placer claim, with valuable water rights. These properties are in the Burnt river mining camp and are near the Gold Coin mine, 26 miles southeast of Baker City.

The Taber Fraction mine at Bourne is employing 42 men in the mine and at the mill. The Cracker-Oregon mill, which has been leased by the Taber people, has been overhauled and new machinery added, and has for several weeks been kept treating the Taber Fraction ores.——The Golconda, near Bourne, has opened a large body of ore. The mill is being overhauled and new machinery will be added.

Josephine County.

The Buckeye Mining & Smelting Co. has begun development work on the Buckeye mine of the Slate Creek district, near Grants Pass. The company is building a wagon road to the mine. A compressor is being placed.

Manager C. Hoofer of the Mt. Pitt mine on Jump-off-Joe, near Grants Pass, states that he will put in a compressor and power drills at the mine in February.——A 5-stamp mill is being placed on the Higgins mine in the Chetco district.——S. G. Adams, general manager of the Capital City Gold Mining Co. at Sacramento, Cal., which owns the Baby mine, eight miles north of Grants Pass, is at the mine arranging for additional development work.

Lane County.

President Zimmerman of the Lucky Boy mine, near Blue River, says that within 60 days the deep crosscut on the mill level will be completed and the ore will be delivered at the mill.

SOUTH DAKOTA.

Custer County

It is reported that the Lilian Bald Gold Mining & Milling Co. will start a three-compartment shaft to develop their claims near Custer. C. E. Perrin is secretary.

UTAH.

The annual report of State Coal Mine Inspector Gomer Thomas recommends the passage of a law that will regulate the use of high explosives in coal and hydrocarbon mines during working hours and to limit the period for using explosives to the time when all employees are on the surface except those actually employed in firing the shots. Men employed in the mines are allowed to use explosives which cause the air in the mines to become vitiated by the unnecessary use of powder for blasting off the coal. In some mines they are shooting and using powder throughout the day. The great source of danger is in the free use of powder, such as blown-out shots, etc., and nearly all explosions come through this source, especially when a mine is dry and dusty. The year 1905 was the most prosperous for all interested in mining coal of any years since mining commenced in Utah. It would have been more prosperous if the railroads had had sufficient equipments to handle the coal, while the mine officials, owing to the scarcity of miners, could not comply with the great demand for coal. The number of accidents, while low in comparison with other States, is no doubt much higher than it would have been if the workmen were of a more careful class and were able to co-operate with their employees in efforts to provide for their safety. The report shows that the total production of coal during the year was 1,602,528 tons, an increase of 39,254 tons over 1904. The output of coke was 215,712 tons, an increase of 30,695 tons over the preceding year. The coal production during 1905 was distributed among counties as follows: Carbon, 1,444,565 tons; Summit, 74,911 tons; Sanpete, 4,202 tons; Emery, 3,500 tons; all other counties, 75,350 tons. The value of the coal is placed at $1,890,982, an average of $1.18 per ton on cars at the mine. The report shows that 1,963 men were employed in the coal mines and worked 2,376 days. Fatal accidents numbered seven, and other serious accidents, 36. The mines used 150,642 lb. of powder and 83,692 lb. of dynamite. Horses and mules to the number of 167 were employed in the mines. Fifty steam boilers and two locomotives were used. Coke ovens in operation numbered 754. Employees of the Utah Fuel Co., the leading producer, are classified according to race as follows: Americans, 879; Germans, 54; Finns, 157; Italians, 171; Austrians, 260; Swedes, 7; Frenchmen, 16; Greeks, 111; Slavs, 3; negroes, 14; Mexicans, 2; Japs, 46.

Beaver County.

The Moscow mine, in the Star district, near Milford, is being worked under the direction of Superintendent Ferguson.——Silver ore is being taken from the Talisman mine, near Milford. The bottom of the shaft at 425 feet is in ore.

Grand County.

Preparations are being made by the following companies for starting work near Basin in the spring: The Tornado will be developed and its product treated in the Basin stamp mill; also the Florence, on Mineral mountain, and the Michigan property, on Castle mountain. The High Ore and Skylark properties are being put in shape for developments by the new companies. The Grouse Mountain Co. will start up and continue their tunnel to tap the gold vein for which they have been tunneling for the past year. The Boston & La Sal Co., in Beaver Basin, are doing preliminary development work to open up the Beaver Basin and Deep Creek mines.

Morgan County.

M. A. Dougherty, manager of the Carbonate Hill mine, near Peterson, is preparing to increase work at the mine.

Juab County.

Most of the leasers at the Eureka Hill mines, at Eureka, have been granted renewals for an indefinite time.——It is expected that the Godiva mill at Eureka will be ready for work by March 1.

Salt Lake County.

A 40 h. p. hoist has been ordered for the Bingham Mary mine at Bingham by Manager S. M. Bamberger. The steel gallows frame is expected to be completed by March 1.

Tooele County.

Superintendent Jones, of the Sacramento mine, at Mercur, reports that a new body of cinnabar ore has been cut 500 ft. away from the body last found. The new body of this ore was found by means of an incline 150 ft. in depth on the tunnel level.

Wasatch County.

According to the Salt Lake *Tribune*, the miners and prospectors wintering on the North Fork of the Duchesne in the former Uintah Indian reservation have organized a district to be known as the North Fork Mining District. They have received letters from people in different mining camps in Nevada, Utah and Colorado who desire to come to the North Fork district this winter, and asking for information regarding the camp and the climatic conditions. The men in the North Fork want to discourage any attempt to create a stampede into the camp this winter, as it would only result in disaster similar to that of Thunder Mountain. The conditions on the North Fork are very unfavorable to winter prospecting. The snow lies three and four feet deep in the mountains, and the storms at times are severe. It is impossible to prospect when one cannot see the ground, and living in a tent at this time of year would entail privation. The valley of the North Fork is at an altitude of about 7,300, but the mountains rise abruptly from the river and attain a height of 12,000 ft. in seven miles. There are about 15 men wintering on the North Fork, but they have been there since the opening of the reservation last August, and have made adequate provision for the winter. The district is 21 miles from north to south and 24 miles from east to west. Most of the locations made to date are within four or five miles either side of the valley of the North Fork in places most easy of access. Heber, on the Denver & Rio Grande Railroad, is the gateway to the North Fork; from there to Woodland is 16 miles; thence 26 miles to the district. The road at the present is in very bad condition and impassable on the summit, but it is probable that the people of Heber will improve the road by spring. The summit of the West Fork pass, down which the road comes, is at an altitude of 9,000 ft. and covered covered with about four feet of snow in winter. A road will be built in from Park City, about 45 miles away.

Weber County.

The Utah Smelting Co. is incorporated for 100 years with a capital stock of $500,000. The principal place of business of the company will be Ogden. The officers of the company are David Eccles, president; Bela Kadish, vice-president; Charles W. Nibley, secretary, and John Pingree, treasurer. The company intends building a smelter near Hot Springs, 10 miles north of Ogden.

WASHINGTON.

Ferry County.

The owners of the Knob Hill and American Flag properties, on the Kettle river, two miles from Hughes Siding, and 19 miles from the Granby smelter, have closed down the mine for the winter, but development will start again next March.

An air compressor has been put in at the Oversight mine, on Belcher mountain, near Republic.

Okanogan County.

(Special Correspondence).—The Ruby Mining Co. is developing veins carrying sulphide of antimony on Mount Chapaca, four miles south of the British Columbia boundary line. The group comprises the Argentite, Pyrargyrite, Mystic Shrine, Beggar's Choice, Hide and Seek, Labyrinth, Crescent and Homer. There are several veins on the group. The value is in silver and copper. The company has shipped 130 tons of ore and 26½ tons of concentrates. The wagon transportation to the railroad cost $2000. One carload went to the Tacoma, one to Nelson, B. C., and two to the Everett, Wash., smelter. The Ruby Company began work in January, 1903, and has operated continuously since. A main working tunnel started above the level of the Similkameen valley cut the Ruby vein 950 ft. from the portal and is now in 1,060 ft. and being driven ahead for other veins. Drifts have been started on the Ruby vein. A sampling mill is to be put in when the Victoria, Vancouver & Eastern Railway is finished.——The Rainbow mine, on Palmer Mountain, has been sold to J. J. Bennett, Fay Harris and John Woodward.

Loomis, Jan. 13.

George W. Hedges of Spokane is making preparations to work the Capital Mining Co.'s property on Palepick mountain, five miles from Twisp. Mr. Hedges proposes to sink 100 ft. deeper. The shaft is down 65 ft.——The Washington-Calumet Mining Co. are building cook and bunk houses, blacksmith shops and ore bins on its property on Goat creek, north of Twisp. S. S. Callahan, manager, is superintending the work.——The Skylark Mining Co., a Spokane corporation, owning property one-half mile south of Twisp, are pushing work. John T. Holley has charge.——The Spokane mine, a galena property, two miles east of Twisp, is working.——Hotchkiss Bros., owners of the Cherry group, on Lookout mountain, are driving a long tunnel to crosscut their ore body at a depth of 600 ft. Boswell, McClure & Jones, owners of the Humboldt group, have found good ore in their crosscut tunnel.

Pierce County.

At the Tacoma smelter an additional bag-house for lessening the waste from the lead furnaces is being built. The wharfage is to be enlarged and dredging operations undertaken for accommodating more vessels at the company's docks. A 60-ft. extension will be built to the copper refinery to make room for 64 additional tanks, for another reverberatory copper-casting furnace for melting cathodes, blowing engines, electric motors, etc.

Skagit County.

The Cascade Consolidated Mining & Smelter Co. has made the preliminary survey for a railroad to connect with the Great Northern, which will enable the company to ship its ore direct to the Everett smelter without change of cars. This road is in the heart of the Cascade and Stehekin mining districts and will furnish an outlet for the product of more than 150 mines.

Stevens County.

C. Fleugel has sold the Anaconda and the Copper King mines, on the south slope of Red Top mountain, eight miles southeast of Boundary City, to John Keough, of Colville, for $60,000.

Work has commenced on the Jay Gould mine, at Chewelah, which was recently bonded by H. W. Wright and G. H. Walters. Drifting will be done on the 100-ft. and 180-ft. levels.

Whatcom County.

At a meeting of the Great Excelsior Mining Co. directors in Seattle, at which S. E. Moore of Philadelphia was chosen president, it was determined not to operate the mine until it had been learned whether a smelter will be built on Bellingham bay.

WYOMING.

The output of the metal mines of Wyoming during 1905 was not as great as during several preceding years. The iron mines lead in the value of product with a production of 250,000 tons, valued at $425,000. The greater part of this output came from the mines of the Colorado Fuel & Iron Co., at Sunrise, and was shipped to Pueblo, Colo., for reduction. Of copper, there was produced 2,000,000 lb., valued at $320,000, nearly all of the product coming from the Ferris-Haggerty mine in Carbon county. The gold production is estimated at $30,700, and the silver at $32,528. During the last two months of the year several gold discoveries were made. A rush of prospectors started to Copper mountain, in Big Horn county. At Camp Kirwin, Big Horn county, development work was done during the year on gold lodes. There was little activity in the South Pass field. Practically all of the gold mined in

the State during the year came from this district, however. With the advent of the railroad in the summer of 1906, the low-grade gold deposits will be opened. During the year the C. F. & I. sank a four-compartment shaft to the depth of 400 ft. on the Chicago iron deposit, near Sunrise, and the mine is now producing several hundred tons of ore daily and will produce 1000 tons daily in 1906. The C. F. & I. has also purchased the Rawlins iron mine, which will be developed during the coming year. During 1905 iron deposits of vast extent and value were discovered in the State, one corporation alone securing 30,000 acres of iron lands. A majority of the discoveries are remote from railroads and can not be placed on a commercial basis under existing conditions. Steady development work proceeded in the Grand Encampment copper district during 1905, and a number of properties there will become producers during 1906, when two railroad lines will penetrate the district. The capacity of the Grand Encampment smelter, which is 30 miles from a railroad at this time, is to be increased.

FOREIGN.

AFRICA.

Rand.

The production of gold at the Rand in December is officially announced at 431,594 fine ounces, compared with 424,757 fine ounces in November and 362,264 ounces in December, 1904. The preliminary estimate placed the production last month at 435,000 fine ounces.

AUSTRALIA.

Victoria.

The first mine in the Commonwealth to sink its shaft 4,000 ft. is the New Chum Railway at Bendigo. There are workings at a greater depth, but this has been made up by winzes. The New Chum Railway have a winze down 4,226 ft., and that of the Victoria Quartz is over 4,100 ft. deep. In the case of the New Chum Railway, there is now a straight shaft from the surface to the bottom at 4,005 ft. The shaft is being sunk to make a connection with the winze, and when this is done the cage will have a direct run through the shaft of over 4,000 feet.

The Victorian Government having been fully recouped the £20,000 expended on the purchase of the cyanide patent rights, so far as the State is concerned henceforth the cyanide process may be employed without charge in Victorian mines. The company holding the patent claimed a royalty of five per cent for use. The State Government charged half that amount until the sum of £25,000 was raised, when the process became free.

CANADA.

BRITISH COLUMBIA.

Boundary District.

W. C. Thomas, smelter superintendent of the Dominion Copper Co., has blown in the second furnace of that company's reduction works at Boundary Falls, which makes every smelter in the Boundary now operating a full battery of blast furnaces—12 in all—except when some minor repairs are going on. Eight of these furnaces are at the Granby smelter, two at the British Columbia Copper Co.'s and the other two at the works of the Dominion Copper Co.——Boundary ore shipments for the week ending January 13 were as follows: Granby mines to Granby smelter, 18,252 tons; Mother Lode to British Columbia Copper smelter, 2,080 tons; Brooklyn-Stemwinder to Dominion smelter, 1,770 tons; Rawhide to Dominion Copper smelter, 450 tons; Sunset to Dominion Copper smelter, 450 tons; Emma to Nelson and British Columbia Copper smelter, 276 tons; Oro Denoro to Granby smelter, 99 tons; Providence to Trail smelter, 60 tons. Total shipments for the week, 23,437 tons; total for 1906, 29,120 tons. Boundary smelters treated: Granby smelter, 16,976 tons; British Columbia Copper smelter, 2,665 tons; Dominion Copper smelter, 2,670 tons. Total treatment for week, 22,311 tons; total for year, 32,572 tons.

Nelson District.

It is announced that the zinc smelting plant at Frank will be doubled in capacity, from 60 to 120 tons a day. The work should be completed within the next two months. The plant owns its own coal, quarries it out at the back of the works and converts it into gas, which is used in the retorts. These are manufactured by the company, which is thus a pottery plant as well as a gas works and a zinc smelter. A rate given by the Canadian Pacific Railway for zinc ores from all points in the Slocan, Lardeau and Ainsworth districts is $2.25 a ton, as against the $10 a ton freight charged to Iola.

Rossland District.

The output of the Rossland mines for 1905 was 315,000 tons, valued at $3,780,000. The output for the 12 years past since and including 1894 is 2,314,893 tons, of which the estimated value is $33,490,141.——In Le Roi mine the Black Bear shoot has been found on the 900-ft. level and on the 1,000-ft. level. The section between the 1,350 and the 1,550-ft. levels has been explored with good results during the year, and recently a contract was let to deepen the winze from the 1,550 to the 1,750-ft. level.——In the Center Star the main shaft has been deepened 300 ft. below the ninth level to the eleventh level, opening a portion of the mine which is known to contain some valuable ores-hoots.——At Le Roi No. 2 an important work is the exploration of the ground of Le Roi by means of a crosscut. In the War Eagle the development work and the diamond drilling have led to the finding of some important ore bodies.——The White Bear has developed an ore-shoot on the 700-ft. level.——The Spitzee, with ample funds, should be made a mine during the present year.——The Jumbo has continued steadily during the past year.——In the matter of concentration the progress made has not been satisfactory. Le Roi No. 2 concentrator has been run steadily. Le Roi Mining Co. erected an experimental concentrating plant and only fairly satisfactory results were obtained from it. It was closed down. The White Bear concentrating plant was operated up to the time the mine was shut down in May, and will be operated this year as soon as the mine re-starts, which will be some time this month. The output of ore shipped from and crushed at the Rossland mines during the year ended December 31, 1905:

Mine.	Tons.
Le Roi	110,838
Le Roi (milled)	2,856
Center Star	95,550
War Eagle	61,500
Le Roi No. 2	10,451
Le Roi No. 2 (milled)	11,131
Jumbo	10,729
Cascade-Bonanza	150
White Bear	1,100
White Bear (milled)	3,229
Crown Point	350
Spitzee	4,809
Velvet-Portland	1,977
Gopher	180
Homestake	30
Lily May	90
Inland Empire	30
Total for year	315,000

Ore was shipped as follows from the Rossland district for week ending Jan. 6: Le Roi, 1,410 tons; Center Star, 1,710; War Eagle, 1,230; Le Roi Two, 570; Jumbo, 200. Total, 5,120 tons.——The station on the 11th level of the Center Star has been cut out, and crosscutting to the ledge is in progress. The 11th level is 1,530 feet below the collar of the shaft, but the determination is to go to still lower levels. The work of deepening the shaft from the 11th level will begin as soon as the crosscut to the ledge is completed. Development is in progress on the 11th, 10th, 9th, 8th, 7th, 5th and 4th levels.

J. E. Sorbin has sold the St. Paul to W. R. Brock of Toronto. The company is to be reorganized to resume operations. The St. Paul in on the Red Mountain Railway, west of the Whitebear.——The output for the week ending January 13 was: Le Roi, 1,680 tons; Center Star, 1,950 tons; War Eagle, 1,020 tons; Le Roi, 420 tons; Le Roi No. 2, milled, 1,200 tons; Jumbo, 200 tons; total for week, 6,470 tons, and for the year, 11,590 tons.

Slocan District.

The Trail smelter received 6,656 tons; Hall Mines smelter 273, and Marysville smelter 300 for the week ending January 13. The Slocan shipments were 1,081 tons, and for the year to date 2,433 tons. The chief shippers were: St. Eugene, 410; Sullivan, 300; Eureka, 103; Queen, 44; Arlington, Slocan, 30; Pioneer, 30; other mines, 267.

Vancouver Island.

(Special Correspondence).—The Tyee Copper Co's. smelter ran 11 days and treated 2,035 tons of Tyee ore during December, giving a return, after deduction of freight and refining charges, of $33,460.10.

Duncans Station, Jan. 12.

MEXICO.

Because of foreigners claiming that they had not been given proper protection from Indian outrages in Sonora and Lower California, it is reported that the Mexican Government has issued an order forbidding mining agents in those States to allow foreigners to file mining claims.

Chihuahua.

It is understood that the Barranca de Cobre copper mines, in the Barranca de Cobre district, will commence shipping concentrates as soon as the Orient Railroad reaches Cuesta Prieta. The concentrating plant at the mines was started up Dec. 1. H. T. R. Cowell is the general manager.

Coahuila.

The Compania Carbonifera de Sabinas, S. A., organized in Monterey a few months ago to exploit the coal beds at San Juan de Sabinas, which that company has under lease, is arranging to operate the mines upon a larger scale.

Colima.

The El Mamey Iron Co., organized in Duluth to work iron deposits in the municipality of Villa de Alvarez, will start development work this month. The company intends to utilize the waters of the Mamey river by establishing an electrical power plant.

Mexico.

The Los Arcos Smelting & Milling Co., of Los Arcos, will start its new smelter this week. The smelter has a capacity of 150 tons per day.

Nuevo Leon.

H. C. Harrison, owner of the Benavidez mines and the smelter in the Cerralvo district, has placed an order for a 50-h. p. road locomotive and train of traction wagons, which he will use for hauling bullion from the smelter. The train will include, besides a powerful traction engine, or road locomotive, four ore cars of 12 tons capacity each. The road from the smelter to the railroad station is 22 miles.

Sonora.

The El Tigre mine case, concerning property in the Moctezuma district, has been appealed by the Ensenada Mining Co., composed of B. F. Graham and other original owners, to the State Supreme Court at Hermosillo. The decision of the case in favor of the Kansas City people, who control the El Tigre company, involves $30,000 in costs taxed against the Ensenada company. The El Tigre company has also brought suit against Graham and his associates for $500,000 damages. The El Tigre company is in possession of the property.

Trade Treatises.

Reliance Corliss engines are detailed in Bulletin No. 1,501 from the Allis-Chalmers Co. power department of Milwaukee, Wisconsin.

Bulletin No. 224 of the Sprague Electric Co., 527-531 West Thirty-fourth street, New York City, illustrates and describes the construction and use of their Type D direct-current motors.

Personal.

JAMES W. NEILL is at Butte.

ERNEST LEVY is in Hungary.

E. GYBBON SPILSBURY has sailed from New York for Paris.

MARTIN SCHWERIN is examining mines at Waldo, Oregon.

ARTHUR L. PEARSE sailed from New York for London on January 12.

F. A. KEITH, manager of the Tonopah Company, is visiting San Francisco.

G. C. HEWETT is examining mines in the Bullfrog and Death Valley districts.

W. R. CROSBY, manager of the Butters plant at Virginia City, is at the Palace Hotel.

GEORGE W. MAYNARD, of New York, is still in Mexico. He is now in western Sonora.

HENRY F. COLLINS has been appointed manager of the Cerro Muriano mines in Spain.

WILLIAM C. POTTER is 'Manager of Mines' for the American Smelters Securities Company.

A. P. MAYBERRY is in charge of the Eureka-Richmond consolidation, at Eureka, Nevada.

JAMES STERLING, formerly government geologist of Victoria, Australia, is now living at Los Angeles.

W. J. GRIGSBY has been appointed superintendent Phœnix mine and mill at Johannesburg, California.

F. E. TIFFT, of Denver, is building the new concentrator for the Arizona Copper Company at Morenci.

H. R. MCDONALD has been appointed superintendent of the St. Louis-Magnolia mine at Park City, Utah.

DEANE P. MITCHELL succeeds H. A. SHIPMAN as manager of the Oroya-Brownhill mine at Kalgoorlie.

THEODORE J. HOOVER, lately superintendent of the Standard mine, at Bodie, has gone to Parral, Mexico.

CHARLES C. JONES has removed his office from Salt Lake City to 247 Pacific Electric Building, Los Angeles.

H. E. VAIL has succeeded LEE GLOCKNER as superintendent of the Cosmopolitan mine, in Western Australia.

J. H. COLLIER, superintendent of the Hayden Hill gold mine, in Lassen county, is visiting San Francisco.

NEWTON B. KNOX, who arrived in San Francisco last week from Japan, is on his way to London, via New York.

C. OLSON, of Clarkston, Idaho, has been elected to succeed Frank Brown as manager Jumbo mine at Hump, Idaho.

A LOUGHRAN has been appointed superintendent Humboldt-Tonopah mine at Tonopah, Nev., succeeding W. F. Gunn.

M. CURNOW has succeeded JOHN SIMM as superintendent of the Dakota Mining Company at Portland, South Dakota.

FREDERICK S. HARRIS has been engaged as consulting engineer for the Goldfield-Crayton Mining Company at Goldfield, Nevada.

CORTLANDT E. PALMER is 'general superintendent of mining operations' for the American Smelters Securities (Guggenheim) Company.

M. CLARK is to have charge of the smelter of the Florence Smelting, Mining & Milling Co. at Price Station, Pinal county, Arizona.

HOMER D. FORD has left Denver to become assistant to the superintendent of La Leonesa Mining Syndicate, Matagalpa, Nicaragua.

B. A. WALLACE sailed from Vancouver on his way to Korea, where he has received an appointment with the British & Korean Corporation.

J. HEATH LEWIS has charge of the cyanide plant of the San Felipe mines of the Central Mining Co. near Hostotipaquillo, Jalisco, Mexico.

THE Pacific Coast executive committee of the American Smelters Securities Co. consists of E. B. BRADEN, W. R. RUST and H. B. UNDERHILL, JR.

J. M. BRYAN, of the Liberty mine at Masonic, near Bodie, California, is in San Francisco arranging for the shipment of a stamp-mill to his property.

T. C. ARCHER, who has been superintendent of the Oregon Securities Company's mine, near Bohemia, Oregon, has resigned, and has been succeeded by F. J. Eade.

WILLIAM H. HOWARD, superintendent Pueblo plant of the American Smelting & Refining Co., has resigned to take charge of the construction of the new copper smelter to be built near San Francisco. L. E. PALMER, superintendent of the Arkansas Valley plant at Leadville, succeeds Mr. Howard at Pueblo.

Obituary.

A. W. SALES, an American, assistant superintendent of the Sultana mine, in Sonora, was killed last week. He left the mine for Carba, 37 miles from the mine. The body was found partially devoured by coyotes, with the skull crushed. Renegade Indians are accused of the crime.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market street, San Francisco, has official reports of the following United States patents issued to Pacific Coast inventors:

FOR WEEK ENDING JANUARY 2, 1906.

808,803.—HORSE BLANKET—P. Andersen, Seattle, Wash.
808,967.—SPOON—W. H. Arrowsmith, Oakland, Cal.
808,808.—BROODER—C. J. Becker, Los Angeles, Cal.
808,806.—PRINTING PRESS—M. J. Barnett, San Francisco.
808,818.—TABLE AND BED—C. P. Davies, Oakland, Cal.
808,832.—TELEPHONE RECEIVER—T. E. Gallagher, San Francisco
808,916.—DRAPER—W. T. Gordon, Juniper, Or.
809,054.—ROTARY ENGINE—A. Hager, San Francisco.
808,752.—PIPE LINE—Isaacs & Speed, Oakland, Cal.
808,754.—TREATING ORES—W. J Jackson, San Francisco.
809,191.—TOOL—La Duke & O'Harra, Seattle, Wash.
808,774.—PIANO PLAYER—H. McPhaill, Visalia, Cal.
809,203.—ANIMAL TRAP—G. J. Miller, Endicott, Wash.
809,122.—SPIKE PULLER—L. A. Milligan, Barstow, Cal.
809,123.—STEAM GENERATOR—G. Mitchell, Los Angeles, Cal.
809,204.—STEAM GENERATOR—G. Mitchell, Los Angeles, Cal.
808,675.—TANK—A. B. Mouck, Twisp, Wash.
809,132.—TICKET HOLDER—N. A. Piancich, San Francisco.
808,868.—SIGNAL APPARATUS—K. H. Poyas, Los Angeles, Cal.
808,871.—TANK INDICATOR—Rahm & May, Sacramento, Cal.
808,880.—FOUNTAIN PEN—J. A. L. Snyder, Somis, Cal.
808,782.—PIPE LINE—J. B Speed, Berkeley, Cal.
808,806.—DRILL SHARPENER—J. T. Thompson, Tuolumne, Cal.
809,152.—PIPE WRENCH—G. W. Waitt, San Francisco.
809,038.—TRAP NEST—C. B. Williams, Ontario, Cal.
808,708.—CLAMP—W. B. Wingate, Spokane, Wash.
808,800.—DREDGER—F. V. Wright, San Francisco.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS United States and Foreign Patent Agency the following are worthy of special mention:

DRILL SHARPENER, SHAPERS ANG GAGERS.—No. 808,886. Jan. 2, 1906. James T. Thompson, Tuolumne, Cal. This invention relates to machines for forming drill-bits of rock-drills. Its object is to provide a simple, cheap, practical machine for upsetting, sharpening, shaping and gaging drill-bits in one operation and to protect the heated portion of the drill from oxidation and consequent flaking and waste. Usually it requires several different operations and several different machines or tools to do these things, and where the drill is more or less exposed to the air during such operations, the drill tends not only to cool off rapidly, but to become oxidized on the surface and flake off. The apparatus comprises a suitably supported swage block, a correspondingly tapered sectional die fitting said recess, said die enclosing a space contracted at one end corresponding with the shape and size of a drill shank and spreading out at the other end corresponding with the head of the finished drill, a tapered dolly fitting said die, and a locking-bar to hold said dolly in the die.

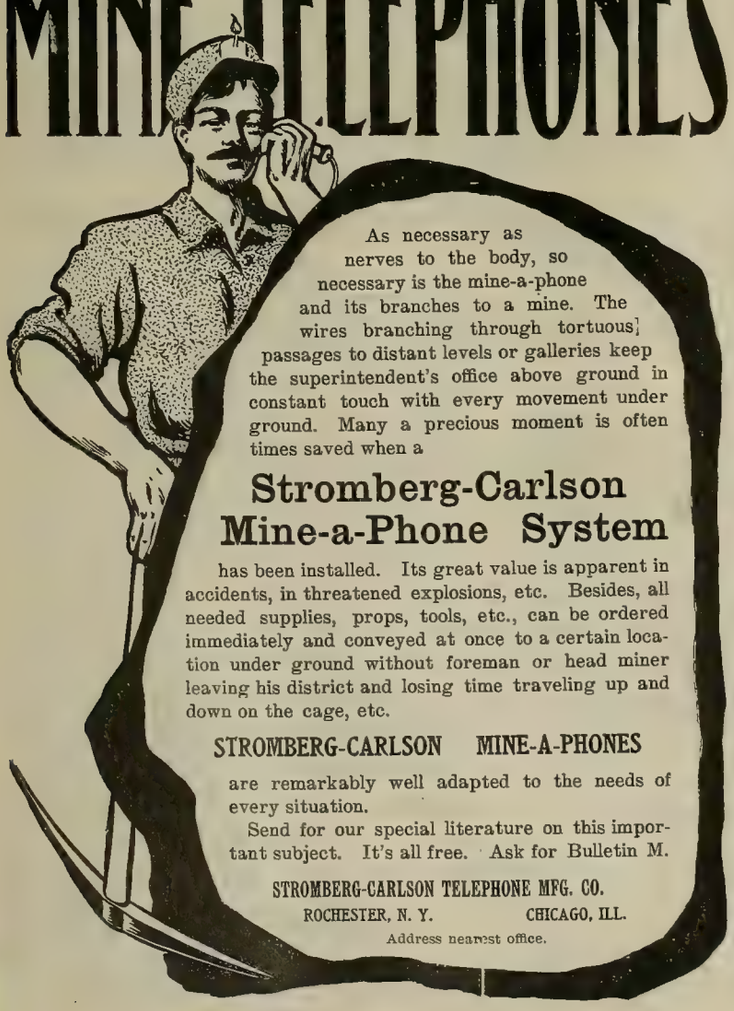
COMBINED TABLE AND FOLDING BED.—No. 808,818. Jan. 2, 1906. Charles P. Davies, Oakland, Cal. This invention relates to an interchangeable folding bed and table. Its object is to provide a simple and practical piece of furniture which will have ordinarily all the appearance of a table, but which, as occasion demands, can quickly and easily be opened out to form a substantial and comfortable bed. It consists of a central base-section having a bottom portion and vertical end portions, said end portions provided with foldable sections, box-sections hinged to said central section and co-operating therewith to form a bed or table, said box-sections arranged to have their ends pass inside of the end portions of the base when folded up into a table, said foldable sections of said base end forming stops to prevent said box-sections closing up when opened out into the form of a bed, a mattress carried by the sections, and said box-sections having hinged back portions co-operating with the bottom of the base section to enclose a containing box or chamber.

DISPENSING DEVICE.—No. 809,419. January 9, 1906. Gilbert L. Belcher, San Francisco. This invention relates to a dispensing can or holder to contain pastes, lubricants, and like viscous substances, and also liquids or semi-liquids, and pertains especially to a container whose contents are adapted to be discharged through the agency of a follower or plunger. Its object is to provide a simple, practical, inexpensive and convenient holder which will also serve as a handle, whereby the contents are kept sealed and thoroughly protected from the air, which holder will maintain its shape as against ordinary external pressure and which by a suitable contrivance will be made to eject its contents as desired. It comprises a tubular holder having a discharge-orifice therein, a cutting device movable in the direction of the length of the holder and a sleeve on the outside of the holder and carrying the cutting device, said cutting device engaging the follower to advance it to eject the contents of the holder.

DEVICE FOR REMOVING MINING AND OTHER DEBRIS.—No. 809,593. January 9, 1906. Simon W. Wible, Bakersfield, Cal. This invention relates to an apparatus which is designed to automatically remove mining and other debris or material which it is desired to remove. Its object is to provide an apparatus which can be automatically operated and by which the rock or other debris may be removed without suspending the washing operations. The device is also available to remove earth or any other material which it may be desired to so move. It consists of a rake composed of curved arms, adapted to engage the material, a central shank to which said arms converge and are secured, a caster-wheel upon which the shank is supported, a swivel attachment for a rope by which the rake and its load may be moved, spacing-blocks by which the outer ends of the arms are maintained in position, means carried by opposite sides of the rake for the attachment of ropes whereby transverse movement in positioning of the rake may be effected with relation to the material to be moved.

TEA STRAINER HOLDER.—No. 809,607. January 9, 1906. Abraham Chundelah, San Francisco. This invention relates to improvements in means for holding a strainer on the spout of a tea or coffee pot or on the edge of a dipper, ladle, or other vessel. Strainer holders as generally constructed are adapted to be thrust into the spout-opening and directly into the path of the discharging liquid, with the result that they are rapidly corroded and destroyed, beside choking up more or less the discharge-opening. The object of this invention is to provide a simple, cheap, practical detachable holder that is adapted to clasp the outside of a spout of any description and to be entirely out of range of the contaminating influence of the liquids to be strained and which device can also be attached to a dipper or ladle where it is desired to dip up soups and other liquids that may need straining. It consists of a holder of the character described comprising opposed jaws and opposed finger-holds and an intermediate hinge portion, and a rod projecting laterally from the jaw portion and having its outer end provided with means forming a swivel-support for a straining-basket.

MINE TELEPHONES



As necessary as nerves to the body, so necessary is the mine-a-phone and its branches to a mine. The wires branching through tortuous passages to distant levels or galleries keep the superintendent's office above ground in constant touch with every movement under ground. Many a precious moment is often times saved when a

Stromberg-Carlson Mine-a-Phone System

has been installed. Its great value is apparent in accidents, in threatened explosions, etc. Besides, all needed supplies, props, tools, etc., can be ordered immediately and conveyed at once to a certain location under ground without foreman or head miner leaving his district and losing time traveling up and down on the cage, etc.

STROMBERG-CARLSON MINE-A-PHONES

are remarkably well adapted to the needs of every situation.

EDITORIAL.

ON the last page of this issue we publish metal quotations telegraphed to us from New York. Our readers will find them accurate. It will need time to demonstrate their reliability, but we look forward confidently to the period when buyers and sellers of ore containing these metals will use our quotations in making contracts.

CORNISHMEN at Grass Valley and Houghton, and everywhere else where any good mining is being done, will be glad to learn that old Dolcoath is not played out. A winze below the 470-fathom level has struck a body of ore which, for two or three months past, has yielded over 100 pounds of black tin per ton, and the shares of the company owning the mine have risen from five to twelve shillings. This will have a good effect on mining generally in Cornwall.

IN our last issue we reprinted part of an article taken from *Economic Geology*, a new magazine devoted to the scientific treatment of questions relating to ore deposits. This magazine has the support of a number of distinguished geologists, and we wish it success in the performance of the work for which it has been designed. We also expect to deal with the problems of ore formation as they appear to the miner and it will be of inestimable service to science and to industry if our contemporary will give voice to the finer ruminations of the scientific mind. We shall wear clothes stained with clay and candle grease, our friend at Lehigh University can don his academic gown, but, however appareled, we shall search for an answer to the same problems, the while we smoke the pipe that makes all men brothers.

IT appears that the Mexican authorities in Sonora have taken radical action in stopping further 'denouncement' (or 'location') of mining claims in that State and in Lower California; they have also held up all claims already in process of acquiring title. The explanation given is that this step was taken on account of the insults to Mexican officials and the complaints of foreigners that their rights were not protected. Whatever the merits of the quarrel, it is evident that those in authority have taken pains to prove that complaint is warranted, for this high-handed action is without precedent and is likely to create a most unfortunate impression among those who are investing money in Mexican mines.

THE fortuities of place are readily overcome nowadays by the help of fast steamships and limited trains. This annihilation—or at least contraction—of distance makes for better understanding among people living in widely separated regions. We can correspond with our mining friends in Australia with comfort, for a letter only takes three weeks; we can reach New York in less than four, and London in ten, days. Even the Californian engineers in South Africa need not feel exiled if they use the mail with sufficient frequency. These remarks are prompted by the receipt of a valuable contribution on dredging from a friend who writes to us from Switzerland during an interval of rest snatched from a nomadic occupation. The psychical distance that sometimes separates people belonging to the same household is less than the geographic leagues that friends can kill by kindly interest in each other.

A BILL is before Congress the purport of which is to apply a portion of the sales of public lands to the endowment of schools or departments of mines and mining in connection with the colleges established in the several States under the provisions of an Act of 1862, whereby public lands were donated to the several States and Territories that provided colleges for the benefit of agriculture and the mechanic arts. It is a supplement, intended to help mining education by means already applied to the aid of special instruction in other branches of industrial knowledge. The various schools of mines supported by State appropriations, and the special mining departments of State universities, are undoubtedly doing good work and deserve all the financial support that the community can afford to give them. While America has reason to be proud of the big technical institutions, her industrial development owes much to the smaller local colleges, which have given instruction to young men unable to go far from home or to take three or four years from a bread-winning occupation. There is only one danger in such subsidies to colleges, and that is an increase in their numbers, whereby the teaching talent is distributed among a large number of poorly paid positions. We need good teachers, properly paid, more than buildings, apparatus or multiplicity of institutions.

OUR first London letter appears in this issue. It will be found interesting. Among other matters reference is made to the Dolores Mining Company, the success of which is noteworthy because it was examined by four of the best men in the profession. We publish some extracts from the company's report, just issued.

Chinese Cheap Labor.

It is stated that Mr. Arthur Balfour, ex-Premier of Great Britain, cabled this week to Mr. Benjamin B. Lawrence of New York: "All is lost save golf." It is said on even better authority that Mr. Balfour remarked to Mr. Joseph Chamberlain, as Bill Nye did to Bret Harte, on the occasion of a celebrated poker game, when Ah Sin got the best of them: "We are ruined by Chinese cheap labor." Whether these words were actually used, we cannot swear, but we have excellent reason for believing that such sentiments as they express were felt during the last few days by gentlemen on the other side of the Atlantic. At the present moment the people of the Pacific Coast, whatever their opinion concerning the exclusion of the Mongol races, can afford to contemplate with intelligent interest the complications brought about by the introduction of Chinese into South Africa.

The overwhelming defeat of the Conservative party in the general election just ended in England, together with the great increase in the number of Labor representatives elected to Parliament, is certain to affect the situation in South Africa. The order in Council permitting the introduction of Chinese coolies to work in the mines of the Rand was the work of the Conservative administration recently resigned and now overwhelmingly discredited by the support given to their Liberal opponents. The employment of coolies under indenture was opposed from the first by a small party in the Transvaal, by the labor leaders in England and by a large number of people, some of whom were only sentimentalists, while others, it must be allowed, were much more than that. Unfortunately a problem which should have been discussed dispassionately and with full knowledge of economic conditions, became a political question. In consequence, it is likely that the action taken under Conservative government will now be reversed, for the new Liberal Premier is not likely to deny a demand for such action when made by the Labor leaders and endorsed by a large body of his more immediate followers. The introduction of Chinese has been unpopular; it was done in the best interests of the mining industry of the Transvaal, but as that industry is dominated by a group of clever German Jews, it has been easy to appeal to prejudice. Most of the mine operators are large-minded men of high character, but it has been difficult to make Englishmen see that their interests were national, and while mining men, acquainted with actual conditions in South Africa, have approved of the necessity for introducing a cheap and plentiful labor supply, the average Britisher has had an aversion to anything that savored of slavery. It is a sentiment, ill founded it may be, but people are often swayed by sentiment to the exclusion of logical thinking, and there is no doubt that the recent election in England was affected by this feeling just as much as it was by the debate between free trade and protection. To the British workingman the Chinese are simply blacklegs imported by capitalists to keep down wages and obviate the necessity for white labor at Johannesburg.

There are now about 50,000 Chinese on the Rand, and with them nearly 90,000 Kaffirs, the 140,000 colored workers being bossed by 16,500 white men. Recruiting for Chinese has been going on systematically for two years; it has been a slow process, because the average Chinaman hates to leave his easy work in the fields for the severe labor of the mines and to exchange the pleasant life of the village for a restricted existence in the compound. How they are recruited is told in the report of the American consul at Tientsin, which we reproduce on another page of this issue. The Chinese have proved a disappointment; while many of them are splendid fellows physically, most of them are inferior

to the Kaffir and not to be compared with the Zulu. The coolie is a wily fellow and shirks his work even more successfully than the native African; in consequence he requires more supervision, one white boss being set over eight Chinese. Some of the mine managers claim that the coolies are not needed, and that the higher priced white labor is in the end more economical; these critics have given facts and substance to the opposition which demands the repatriation of the Chinese. While this agitation was growing, some of the coolies managed to escape from the compounds, becoming marauders, wandering at will over the farming country of the Transvaal. Indeed, so many managed to get loose that extra police protection became necessary. This, of course, made the case worse and afforded another argument to the anti-Chinese party in England. Thus the matter stands. The probability is that the introduction of more Chinese will be stopped, even if the Liberal government refuses to be carried by the clamor of the Labor party to the extent of interfering more radically with present conditions in South Africa. Should the new Government go so far as to cause the repatriation of the Chinese, the mining industry will receive a vital blow and the political situation in the Transvaal will become acute.

However, the production of gold will not suffer as much as might be supposed. It has benefited less from the Chinese than was expected and, should their help be lost, more effort will be made to utilize white labor and whatever natives are available. The fact is, the history of South African mining during the past five years has been a series of disappointments. The close of the Boer war was expected to bring a betterment of economic conditions, a lessening of taxation and a cheapening of supplies. On the contrary, the war demoralized the native labor supply, it was succeeded by an expensive administration and by the imposition of heavy taxes. When matters looked bad, the mine operators urged that all that was needed was cheap labor, the white man could not work alongside the Kaffir and there were not enough Kaffirs in any case. Three years ago the Johannesburg papers began to shout that it was "Bankruptcy or the Chinese" for the Transvaal. The mines had 50,000 laborers and needed 150,000. The London market for South African shares was lifeless; everything looked gloomy; so the people acquiesced in the importation of Chinese. They came There are now 50,000 of them on the Rand. But this is not enough; 30,000 more are wanted. In the meantime the output of gold has increased to $9,000,000 per month and yet the quotations for shares have continued to fall until Rand Mines, a consolidation of interests in a group of leading companies, is £7, while it was over £14 on the day the Boer war ended. The Chinese have not benefited the investor at home as much as was expected, the labor problem is not solved and the whole matter has been plunged into the vortex of politics. It is a bad situation. But at the bottom of it all is a factor to which cheap labor is secondary. We refer to the high cost of living which has made the Transvaal anything but a white man's country. The 45,000 Chinese who first came to Africa received $1,500,000 in the first six months of 1905, while white men out of work stood loafing at the street corners. Excessive railway rates and heavy taxation have made residence prohibitive save to those receiving big salaries. A married workingman cannot live on less than $1200 per annum. Even American mining engineers in receipt of good salaries complain that they exile themselves for nothing; the ordinary expenses of maintaining a household, plus the numerous contributions to subscriptions and funds of every kind, make such inroads into their receipts that there is but little left. A Californian engineer who has lived at Johannesburg for three years told us that except for half a dozen men who were at the top, the rest of the profession were no better off than at home, despite the apparently larger salaries they received. The high cost of living is the curse of the country, and improvement in this regard forms the only lasting solution of the problem that threatens to bankrupt South Africa. It is not a pretty picture, that of a big gold mining region undergoing exploitation with the assurance of exhaustion without particular benefit to anyone

Profits are not increasing in the ratio expected, for costs are scarcely down to a pre-war basis despite better government and Chinese labor. The position can be expressed by example. In 1899, before the Boer war, the Simmer & Jack mine during six months crushed monthly an average of 44,213 tons of 8 dwt. ore and realized therefrom a profit of £31,218. In the best month since the war the same mine produced 52,800 tons of 7½ dwt. ore at a profit of £31,596. The increased tonnage did not yield a larger profit on the slightly poorer ore, despite the investment of additional capital and the introduction of alien labor. This typifies the position on the Rand. Shareholders have seen their holdings depreciate steadily, while the life of the individual mine is measurably nearer an end; there has been no such immigration of white settlers as was expected; a mining camp has been supported and gold has been dug in increasing quantity without any marked benefit to those on the spot or to those at home, except the officials and a few speculators. The economic problem has not been solved while a nasty political squabble is impending as soon as the Transvaal gets self-government, an event to occur shortly. As we see the situation at this distance, without special knowledge and also without prejudice, it seems to us that the well-being of South Africa depends upon such adjustment of economic conditions as is within the scope of government, by lessening the expenses of administration, by regulation of railroad freights and by diminution of the indirect taxation levied through custom duties. Any condition that makes it impossible for a man to maintain a home is bound to place a bar to the permanent prosperity of a country.

The Price of Copper.

Mining of late has been much stimulated by the rise in the useful metals, more particularly copper. During 1905 the price rose from 14½ to 19 cents, the average being 15¾ cents per pound. Apart from its effect on copper mining proper, in which the precious metals are extracted as a by-product, this rise has encouraged prospecting and opening up of low-grade mines throughout the West, for the growth of metallurgical plants intended to treat the copper output has improved the market for silicious ore unsuited to stamp-milling or cyanidation.

Extraordinary conditions have existed in the copper market during the past year; the large purchases for Chinese account took away all surplus stock in America and when, late in summer, a large consumption demand set in, increasing in volume during December, it became apparent that there was an unprecedented shortage of spot metal. Prices advanced by leaps and bounds. Manufacturers who had not covered, and who had to enter the market to buy small lots in order to keep their mills going, were forced to pay almost any price asked. During the last week of 1905 and the first week of 1906 small lots for immediate delivery sold as high as 19½ and 20 cents, while a large business took place, at first hand, for later delivery, up to May, at 18½ cents delivered, payment in thirty days. Hence the apparently contradictory figures given out by different agencies. It is a most difficult matter to arrive at an accurate average. One must consider not only every known transaction, but also the offering and bids in the market for any but retail quantities. Due weight must be given, in the first place, to sales that are made at a certain figure; then to bona fide offers made but not accepted; and finally to bids, made by would-be purchasers, that do not lead to actual business. At times, when the market is firm, a great many buyers may come out without proportionate selling and, on the other hand, there are days when holders are anxious and ask certain nominal prices which they would gladly shade the moment business is in sight; this condition also should be expressed in the quotation of a true average.

The big rise in the price of the metal led last week to re-sales, by the Chinese, in Europe and the United States of parcels large enough to depress the price. As a consequence, the market has eased up. In any event, a decline from the maximum was to be expected and most well informed observers have wondered at the capacity of the demand which has maintained such prices so long. It has become evident that consumption is on a prodigious scale and if the present industrial conditions continue, all the copper likely to be produced in 1906 will be wanted at good prices.

By the Way.

In his presidential address, before the New York Academy of Sciences, Professor James F. Kemp said:

The rush of the gold-seekers to California in 1849, and the quickly following one to Australia in 1851, were notable migrations in search of the yellow metal, but they were not the first in the history of our race. There is, indeed, no reason to suppose, that, in the past, mining excitements were limited even to the historical period; on the contrary, the legends of the Golden Fleece, and of the golden apples of the Hesperides, probably describe in poetic garb two of the early expeditions; and long before either we can well imagine primitive man hurrying to new diggings in order to enlarge his scanty stock of metals. Among the influences which have led to the exploration and settlement of new lands, the desire to find and acquire gold and silver has been one of the most important; and as a means of introducing thousands of vigorous settlers, of their own volition, into uninhabited or uncivilized regions, there is no agent which compares with it. In this connection it may be also remarked that there is no more interesting chapter in the history of civilization than that which concerns itself with the use of the metals and with the development of methods for their extraction from their ores. Primitive man was naturally limited to those which he found in the native state. They are but few, viz., gold in wide but sparse distribution in gravels; copper in occasional masses along the outcrops of veins, in which far the greater part of the metal is combined with oxygen or sulphur, copper again, in porous rocks, as in the altogether exceptional case of the Lake Superior mines; iron in an occasional meteorite, which, if its fall had been observed, was considered to be the image of a god, descended from the skies; silver in occasional nuggets with the more common ones of gold; and possibly a rare bit of platinum. Besides these no other metal can have been known, because all the rest and all of those mentioned, when locked up in their ores, give in the physical properties of the latter but the slightest suggestion of their presence. Chance discoveries must have first revealed the possibilities of producing iron from its ore—really a very simple process when small quantities are involved; of making bronze from the ores of copper and tin; of making brass with the ores of copper and zinc; of reducing copper and lead from their natural compounds; and of freeing silver from its chief associate, lead. All of these processes were extensively practiced under the Chinese, Phenicians, Greeks, Romans and other ancient peoples.

As the need of weapons in war, the advantages of metallic currency and the want of household utensils became felt, and as the minerals which yield the metals became recognized as such, the art of mining grew to be something more than the digging and washing of gravels; and in the long course of time developed into its present stage as one of the most difficult branches of engineering. Chemistry raised metallurgical processes from the art of obtaining *some of a metal* from its ore, to the art of obtaining *almost all* of it and of accounting for what escaped. It is, in fact, in this scientific accounting for everything, that modern processes chiefly differ from those of the ancients.

Of all the metals the most important which minister to the needs of daily life are the following, ranged as nearly as possible in the order of their usefulness: Iron, copper, lead, zinc, silver, gold, tin, aluminum, platinum, manganese, chromium, quicksilver, antimony, arsenic and cobalt. The others are of very minor importance, although often indispensable for certain restricted uses.

The manner of occurrence of these metals in the earth, and their amounts in ores which admit of practicable working, are fundamental facts in all our industrial development, and some accurate knowledge of them ought to be a part of the intellectual equipment of every well-educated man. The matter may well appeal to Americans, since the United States have developed within a few years into the foremost producers of iron, copper, lead, coal, and, until recent years, of gold and silver; but with regard to gold, they have of late alternated in the leadership with the Transvaal and Australia, and in silver are now second to Mexico.

Despite the enormous product of foodstuffs, American mining developments are of the same order of magnitude; and the mineral resources of the country have proved to be one of the richest possessions of its people.

AMALGAMATED PLATES made of Muntz metal do not absorb mercury as much as copper plates. On the other hand, the mercury does dissolve a good deal of the copper and zinc constituting the Muntz metal. Silver plating is almost a necessity, as it prevents the mercury from dissolving copper from the plate and therefore does away with the chief cause of the stains that are prejudicial to good service. Muntz metal plates have been used for many years in the Thames or Hauraki district of New Zealand, and they are especially adapted to pyritic ores and to mills using mine water.

CONCENTRATES.

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and to give information dealing with the practice of mining, milling and smelting.

THE present winter in northern Alaska is reported to be the most severe in several years.

BORAX is the most commonly used flux employed in melting gold obtained in chlorination plants.

PLATINUM is found in a great many places in California, but these occurrences are usually of limited value.

THE highest price ever reached by quicksilver on the Pacific coast was $1.55 per pound—$118.575 per flask of 76½ lb. net.

WHERE placer claims conform to the Government land surveys, no survey of the claim is required when application is made for patent.

ANTIMONY can often be eliminated from gold and silver ores by roasting, as the metal and its sulphide volatilize at comparatively low heat.

A HORSESHOE magnet will become de-magnetized if heated to redness. A moderate degree of heat, however, will not affect a magnet of this kind.

NATIVE platinum in ore has recently been reported from a number of places, but in all probability there has been some mistake in the identity of the mineral.

AN ore-shoot is a mass of ore in a vein, fissure, or deposit. Chute is a passage-way for ore, underground or on the surface, and is built of timbers and plank.

FLY-WHEELS can easily be speeded up to their destruction. A safe peripheral speed is not above 5,000 ft. per minute, except with specially constructed wheels.

THE chief advantage of suspended ore-feeders in stamp-mills is that they afford more room and light back of the battery—things much to be desired in some mills.

SEVERAL other metals and alloys are substituted for copper when the price of copper becomes prohibitive. The chief substitutes are aluminum and babbitt metal.

GOLD which is 750 fine is worth $15.50 per ounce; 800 fine, $16.53; 850 fine, $17.57; 875, $18.08; 900, $18.603; 920, $19.01; 930, $19.22; 950, $19.63; fine gold—1,000 fine, $20.6718.

MUNDIC is a name given by Cornish miners to several varieties of iron sulphide—pyrite, marcasite, mispickel, etc. It occurs bearing gold and also practically destitute of it.

THE cost of timber per foot in a shaft must depend upon the size of the shaft, dimensions and cost of timber and wages of men. Ordinarily it is from $2 to $2.50 per foot of shaft.

THE electric plant for the Utica Mining Company, at Angels, Cal., was installed in 1899. The power house is on Angels creek, near Murphys, and about eight miles from the mine.

UNDER certain conditions aid is given prospectors by the Government in Australian mining districts and substantial inducements are offered for prospecting and discovery of new districts.

STEAM boilers explode from a variety of causes, but chiefly owing to weakness of the plates, or some defect in the safety valve. Very often the immediate cause cannot be satisfactorily determined after the explosion.

THE gold output for California for the year 1905 was considerably less than it would have been had the water supply been sufficient to have continued mining and milling operations without interruption throughout the year.

THERE may be considerable difference to the ore shipper whether he receive 90% of the assay ounces at $20.67 per ounce of his gold, or 92% of the assay at $20 per ounce for the gold. It is not a difficult matter to figure.

CONCENTRATING JIGS are made of many types and of all sizes, from small machines designed for laboratory tests, and run by hand, to large machines of several hundred tons daily capacity, feeding and discharging automatically.

WHEN sinking a shaft, either vertical or inclined, it is advisable, and in the end generally more economical, to put in station timbers at every point where it may subsequently be desirable to open a level. It is not necessary that the station be cut at the time of sinking, though always less expensive to do so at that time, together with the pocket beneath the level, from which skips may be loaded.

CONSIDERABLE gold is produced by mines in Japan, but all mines in that country are controlled by the Government, and mineral lands are not subject to appropriation as in English-speaking countries, and in most others.

MOST of the stamp-mills in Gilpin county, Colo., are still of the high, slow-drop type. It is thought by local mill men that this kind of mill gives better results than the rapid low-drop mill of California type, on Gilpin county ore.

A GOOD paste to clean steel which has become rusty is made from 10 parts of tin putty, 8 parts of prepared buckhorn and 25 parts spirits of wine. Mix to a paste and rub vigorously on the part to be cleaned, and polish with blotting paper.

GOOD roads in the mining regions of the mountains will do much to reduce transportation costs. Ordinarily it is figured that it costs 25c. per ton per mile to haul machinery and other mining supplies in the mountains of the West.

ONE of the secrets of success in mining is in knowing when to quit. Some mines which have made large profits for their owners have later bankrupted them because they continued to expend large sums of money on them after the orebodies were exhausted.

THERE is now far less mine 'jumping' than in former years. Prospectors and miners have become better informed as to the legal requirements and comply more nearly to them than formerly. A careful observance of the law is the best safeguard of the miner's title.

IT is not always the most scientific mining that is the most profitable. Some mines are worked in anything but what an engineer would consider scientifically, but which will justify no greater outlay nor a more elaborate method of operation, and are still profitable to the owner.

WHILE smelting is a metallurgical process which will successfully treat every ore, if suitable fluxes are available, these fluxes are not always obtainable at a cost which will admit of profitable smelting at the place where the ore occurs. For this reason much ore is shipped to distant reduction works for treatment.

IT is always good business to develop sufficient ore to pay for a mill before building it, and it is still better to open up enough ore to insure a continuous supply for a considerable period. Too often the mill is built before the mine has enough ore exposed to pay the freight on the mill.

IT is 24 years since copper was as high as at the present time. Nineteen-cent copper affords large profits to most operating copper mines and permits some to run which at a little lower price could not pay expenses. The cost of producing copper under favorable conditions has never been so low as now.

SOME California mines produce remarkably fine gold. The San Giuseppe mine, at Sonora, Tuolumne county, which has been idle for some years, produced gold 985 fine—an unusual thing in a quartz mine. The gold produced by the Mount Morgan mine, Queensland, Australia, has averaged about 980 fine.

THE hydraulic ejecting device or elevator (generally referred to as a pump) was installed in the C. & C. shaft at Virginia City, Nev., in the spring of 1899. It quickly and effectually drained the mines in its vicinity, several hundred feet below the Sutro Tunnel level, 1,750 ft. below the surface. The water level is now about 2,350 feet.

THERE is little to be gained in running a tunnel only a few feet beneath the surface, as such excavations only serve to determine the direction of strike, and they usually cave in within two years unless the ground and climate be very dry. Such tunnels, in wet regions, to be kept open must be substantially timbered and often repaired.

IT is not necessary that a vein should outcrop the entire length of the claim to secure the extra-lateral right. It is only necessary that sufficient of the vein be exposed to determine its strike. This is sometimes deceptive, and the claim is laid out in such a manner that subsequent development shows the vein to cross a side line and one end line.

COLLECTIONS of ores, minerals and metals at the county seat of each county of the mining States, which would faithfully represent its mineral resources, could not fail to be of advantage to the section making such local exhibition, as strangers would usually visit and inspect the display, and in this way the probabilities of the development of local interests would be increased.

THE first discovery of gold in the State of Colorado is said to have been made at Idaho Springs on Jan. 21, 1859. The gold discovery which resulted in the stampede of adventurers into the Black Hills of South Dakota was made in 1875 by a half-breed Indian in the foothills of the Black Hills, many miles from any known mines of the present day. No development work has ever been done in the vicinity of the Indian's discovery, and but few men know today that the find was not made within the hills in the region where gold-bearing veins are known to exist.

UNDER exceptionally favorable conditions a gold mine may be operated at a total cost of 50c. per ton, but the conditions must be favorable, indeed. These comprise a large vein of easily broken ore, a means of outlet below, as by an adit driven to connect with mill-holes, through which the ore passes from open-cuts to ore-bins beneath. Transportation must be cheap, the ore free milling, and the mill of large capacity. Failing any one of these, the expense of operation is likely to at once go above 50c. per ton. In addition to the above, and as important as any other consideration, there must be good management.

THE blowing of a charge of matte in a copper converter can only be accomplished satisfactorily by an experienced operator. When the blowing begins, and for some time thereafter, greenish flames are seen playing over the surface of the charge. These are often mingled with yellow flames in the first stages. When the blowing has proceeded until skimming time approaches, blue flames will be observed, occasionally, and if blowing is not stopped, the flames will become altogether of azure blue. When the blue flames have become prominent the blast must be shut off, or the contents of the converter, or a good portion of them, may be blown out and the molten metal scattered all over the place. This foaming and explosive action is caused by chemical reactions taking place in the charge, and the sudden formation of a large volume of sulphurous anhydride (SO_2).

THE cost of stoping a ton of ore depends upon the size of the orebody, its hardness, and its 'let go' (gouges or not), angle of inclination of the vein or deposit, cost of wages and supplies. The stoping of a vein less than one foot wide may be several dollars per ton—$50 or more—and the stoping of a large mass of ore may be reduced to a few cents per ton. No table showing the approximate cost of stoping or mining generally can be compiled, which would be satisfactory or reliable, except possibly for a particular mine where the conditions were well understood and established, and the only differential factor is the changing width of the vein. In some veins a portion of the ore is separated from the walls by a selvage or gouge, and breaks freely from the walls, while in another portion of the same mine, the ore is 'frozen' to one or both walls, which increases the expense of mining.

THE method of separating gold from copper matte by the Block-Hartman process is by roasting the matte to convert any silver present to sulphate, which is then leached out with water and precipitated as metallic silver or copper, the gold remaining in the matte, which is then concentrated in a reverberatory furnace until a small quantity of copper is obtained carrying nearly all the gold. The further treatment, whereby the gold is separated from the copper, is by various means. At Argo, Colo., this process has been reduced to a science, but the method employed has never come to the knowledge of the public, although it has been in use there many years. By roasting gold-bearing copper with pyrite, or sulphur, a matte of copper and sulphur will form on top of the charge, the gold remaining in association with the metallic copper, which is not attacked by the sulphur. In this way the greater portion of the copper may be removed, the metallic portion constantly becoming richer in gold as the amount of metallic copper is lessened, the percentage of gold finally becoming sufficiently high to admit of its being cupelled with lead, producing gold which can be dissolved and precipitated as fine gold.

THERE is a great difference in mill screens and a still wider difference in the opinions of millmen as to their relative merit. Wire-cloth screens present a greater aggregate discharge aperture than perforated or slotted metal screens of equal width of opening. Attempts have been repeatedly made to manufacture a punched or slotted mill-screen having a discharge area equal to a wire-mesh of the same width apertures, but when this is done with ordinary mill-screen sheets the metal is so weakened by the process that it quickly breaks, making the screens expensive. If the metal selected is of a strength sufficient to long resist the impact of the flying rock-particles in the battery, the metal is so thick as to seriously impede the discharge of the pulp, hence the resort to wire-screens where fine crushing and large capacity are desired. It is not infrequently a good idea to decrease the size of the mesh of a mill-screen, of whatever kind, and lower the height of discharge. This results in a finer comminution of particles, while facilitating discharge, but it also subjects the inner surface of the screen to greater wear from impact of flying rock. In some mills the battery screen is divided into three or four sections, the screens being slipped into frames, and being square may be reversed, thus equalizing the wear, but this seems like doubtful economy, as the three ribs placed transversely of the screen opening will reduce the discharge area about 10%, and this more than offsets the additional cost of screens, owing to increased wear. The screen surface should be as large as practicable and be kept free from obstructions of every kind. Nothing is more destructive to screens than overfeeding.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy.

GOLD DREDGING.

The Editor:

Sir—I have had occasion recently to enquire into various aspects of gold dredging. I find that whereas the purely technical side of this industry, such as dredge designing and operating, has been written about a good deal, the statistical and financial aspects have hardly been dealt with at all.

Let me enumerate some questions to which as yet I have not found satisfactory answers:

1. How many payable, or probably payable, dredging areas are known in the world, and what is, approximately, their gross extent? Which are the likeliest countries to prospect?
2. How much gold is produced yearly by dredges, and how much of the production is profit?
3. How many dredges are now working at a profit?
4. How many dredges that were once worked are not now working, and what were the reasons for their stoppage? How much money do these represent?
5. What are the precise costs in different localities? How are costs affected by
   a. Type of dredge?
   b. Nature of deposit?
   c. Nature of power?
   d. Climate?
6. What is the best system of prospecting dredging ground? How should such system be adapted to different kinds of ground? Is drilling as effective as sinking shafts or paddocks? What is an average recovery of the gold contents as shown in prospecting? Why are favorable results in prospecting often falsified in practice?
7. Assuming prospected or otherwise proved ground to represent 'ore blocked out', which is the correct basis of valuation for such ground?

If gold dredging is to be regarded as a scientific industry, it seems to me that satisfactory answers to such questions as these should be procurable. A mass of facts must be available by now. Can you not, through your many sources of information, undertake the collection of these?

The cardinal fact which would seem to emerge from my enquiries is that the known areas of profitable dredging ground are not numerous, and are limited to a few countries. When recently in San Francisco I had this statement endorsed by the man who, I consider, knows more about gold dredging than anyone else. He has for years past sent experienced prospectors over the United States, South America, the East, and elsewhere, but, I understand, outside of his Californian properties has found nothing definitely good. Of course, one must not jump to the conclusion that no more good areas will be found. South America, Alaska, Siberia, India and the Eastern islands still offer an immense field for research; and, although ideal dredging conditions cannot exist in these countries, there is no reason why they should not contain many payable areas. In the meantime, it may be taken for granted that the definitely good areas are limited. Ideal dredging conditions exist, I believe, only in certain parts of California and New Zealand, while Victoria ranks next, but a long way behind. At present the two first named countries are probably producing 75 per cent of the gold won by this method. Dredging in the United States is, I understand, almost confined to California. I make the statement, subject to correction, that there are not more than four dredges working elsewhere at a profit, and that outside California conditions for working are usually unsatisfactory. Several dredges are said to be working at a profit in Montana, but I have found no one who can give me exact statements. In California the chief center of dredging is Oroville, where the conditions are quite ideal. A recent visit to this field impressed me with the idea that the Oroville gravels —proved as they are—form the safest gold mining venture in the world. At Folsom there are also good dredging areas, and Bear River should soon become profitable. But the center of interest in gold dredging will soon shift to the Yuba river. Here a large area of gravel 90 ft. deep has been found to give good values, and several dredges already at work have confirmed these results. One company, alone, will shortly be working 15 dredges, of a new and very powerful type. The strength and efficiency of these is such that they will handle 90 ft. of gravel as easily as the other types can handle 30 feet.

In Canada, dredging on the Fraser and Saskatchewan rivers has been, somewhat unaccountably, a failure; I should like to know the reasons for this. I should also like to have precise figures about the dredges working at Atlin, British Columbia. It is stated, vaguely, that they are working profitably, but, knowing Atlin as I do, I am sceptical. This same frame of mind clutches me when estimating the chances of dredging in all the northern regions—Klondike, Alaska, Siberia. The climatic factor in these countries seems to me almost to exclude the hope of profitable results. The short season, the perennially frozen condition of much of the ground, the heavy cost of labor, and the great distance from foundries and sources of supply, are surely drawbacks of almost vital importance. I am told that dredges are now working profitably both in Klondike and Alaska, while the Russian minister of mines assured me that a number of dredges were getting payable results in Siberia. But I am still sceptical. I have never seen figures or results from any of these places. I shall want to see the balance sheets for, say, two consecutive years' work by some of these dredges, before I can believe that in these countries the climatic factor is not overpowering.

South America, with its immense river systems, offers a great field for possible dredging areas. As yet, results there are of doubtful value. Colombia has been a good deal prospected, with, I believe, not satisfactory results. In Dutch and French Guiana some dredges are working, but I do not know with what success. I lately read a report on ground in Peru, stated to go 75 cents per yard. The writer was a man of presumable experience; had he not been, I should have looked on such a statement as a fairy tale. This ground lies on the eastern side of the Andes, and a dredge would have to be transported in sections. Moreover, as for a long distance there is a precipitous descent, and that by bridle-track only, the sections must be no heavier than a couple of mules could carry between them. It seems to me that a dredge thus designed, especially if working in heavy ground, would surely be a failure. I should like information on this point—not only as to whether it can be sectionalized down to, say, eight cut pieces —but as to whether it can be expected to do satisfactory work on that basis. Buenas Ayres has recently been the scene of a dredging boom—on paper. The locality of the area thus boomed was the river San Juan de Oro, in Bolivia. The first dredge started there worked for six weeks without getting as much as one ounce of gold. It then transpired that the men in charge—picked experts of reputation from New Zealand—had been badly 'salted.' I am afraid there is not much chance for success in this locality.

One of the first dredges worked in South America was located in Matto Grosso, the interior province of Brazil. This dredge has demonstrated the existence of gold there; and the reports of prospectors, if they can be relied upon, point to a large area of possibly payable ground. It is notable that the Matto Grosso gravels carry also diamonds, which are caught on the dredge in considerable numbers. Brains are now at work devising a supplementary plant, which will recover the diamonds after the gravel has been dredged for its gold. Elsewhere in Brazil there is a good deal of prospecting being done, but in a manner I would describe as superficial. I saw lately a dredge at work in the river near the old mining town of St. John del Rey. This belonged to a New Zealand company, and, I believe, was paying expenses. In Tierra del Fuego there are large areas of gravel carrying gold. Those on the Argentine side were extensively prospected by two friends of mine last season. The conditions were pronounced as favorable, but there was too little gold present. On the Chilean side there are some undoubtedly rich areas; but here the ground is rougher, and would require a specially adapted type of dredge. These areas may, I think, be reckoned as possibilities.

New Zealand, Victoria and New South Wales, alone among Australasian States, seem to contain payable gold-dredging areas—though in Tasmania dredging for tin is now being done. Even about dredging results in New Zealand—the home of the industry—there are surprisingly few facts available. I believe that one-third or even one-half of the dredges started in New Zealand have worked at a loss; this would seem to indicate that the methods of prospecting there are casual, and that there are no systematized results to guide would-be valuers of ground. I am told that all possible dredging areas in New Zealand have long ago been secured, also that at the present rate of exhaustion most of the best ground will be worked out well inside 12 or 15 years.

After numerous failures, specially adapted dredges, or, in cases, hydraulic pumps, are now securing fair aggregate results in Victoria and New South Wales. Most of the areas worked, however, are of small extent, and profits are on quite a small scale. As elsewhere, it seems likely that the areas in Australia where dredging conditions are favorable will prove to be limited.

In Rhodesia, or rather over the Rhodesian border, in Mozambique, there was an abortive effort at dredging, the conditions proving unsuitable. I believe this is the only dredge erected in South Africa. In West Africa there is certainly gold in the rivers, but I am sceptical as to general conditions. There are some half dozen dredges now at work there, but their results are indifferent; moreover, I imagine that the richest patches are being worked first.

As regards the East, there is not much yet known of its dredging areas. In Burmah, on the Irrawaddy, a prospecting dredge has been at work for some time. I understand that it has shown profitable figures, but I have no facts about this. However, I look on Burmah as among the possibilities. It seems to me, also, that India is a country to be prospected, but I know of nothing as having yet been done there. Two dredges are at work in the Malay State of Kelantau; from the published returns I judge that they are not paying. In Korea, the Oriental Company is to try an experiment in dredging; while it is stated that in Borneo and the Celebes there are hopeful prospects.

In Europe, there are several dredges at work in Servia. I believe these have earned a commercial profit, for others are being built; but, as usual, there are no precise figures available. In Hungary, there might be dredging areas, but I suppose there is little to be expected of the rest of Europe.

As I started out to ask for information, not to give it, I think I have said all that is compatible with my premises, and I shall not venture into the details of a discussion on which so many others must be better informed. I can, however, say first this, that I believe the Oroville 'school' of dredging, both in methods of prospecting and in designing, is now quite ahead of New Zealand, and that the work now being done at Oroville and Yuba river should be studied by all who wish to master the details of this subject. The exact results from the Oroville field to date, together with a description of the prospecting methods employed there, and an account of the evolution in the type of dredge now in use there, written by those who know, would form a valuable nucleus of facts on which to base a general enquiry into the whole subject.

J. H. CURLE.

St. Moritz, Switzerland, Dec. 24, 1906.

FINE GRINDING.

The Editor:

Sir—I have read with interest the communication on 'Fine Grinding in Metallurgy,' by Mr. E. E. Wann, dated November 29, in your issue of December 16.

Mr. Wann says, in part: "Fine grinding having proven a pre-requisite for the highest extraction by amalgamation and cyanide leaching of gold ores." By fine grinding, I take it that Mr. Wann means crushing the material to such an extent that the largest particle will be fine enough to pass a 150-mesh screen. My experience, gained in this country, the Australian colonies and Mexico, leads me to believe that in the great majority of cases such fine grinding is by no means essential to securing the best commercial results. Of the number of varying classes of ore I have had occasion to examine during my six or seven years' residence in the West, I have met but two or three instances where fine grinding gave an increased commercial extraction of the gold and silver content. In most cases, where the larger portions of the crushed ore were fine enough to pass a 50-mesh screen, or, in other words, were approximately one one-hundredth inch diameter, a greater profit was obtained than when the material was pulverized to slime.

It may be generally stated that, wherever careful classification is carried out, and absolutely free sharp sand is dealt with by percolation, results equally as commercially good will be obtained from the sand as from the slime, though, of course, the treatment of the sand will require probably four to ten times as long as the slime.

In the somewhat rare cases in America in which fine grinding will show greater profit than average crushing, sand and slime treatment, I am strongly in favor of the grinding pan as a comminutor. The pans in pairs are about equal to one 14-ft. tube-mill in capacity, are slightly cheaper in operating and maintenance expense, and are about one-half the cost erected. If used in two series—stage grinding, with intermediate classification—it is probable that their capacity would be still further increased.

For slime treatment, either for true slime or finely pulverized ore, agitation in large, deep, flat-bottomed vats, fitted with revolving arms, to keep the solids from settling out of the thin pulp generally necessary, and with large centrifugal pumps, drawing from the bottom and throwing to the top for agitation and aeration proper, is universally the most economical system.

Removal of the dissolved value can be most economically and perfectly performed by the use of vacuum filters of the Moore-Butters-Cassel type. These filters are rapidly coming into use. They are about one-half the cost, by tonnage treated, of the standard-type filter-press, and their operation is attended with about one-third the cost. In but very few cases can an adequate extraction be obtained from the slime by conducting the treatment in filter-presses; it is almost universally imperative to dissolve the metals by agitation prior to the separation of the gold-bearing liquors from the solids.

In the treatment of gold and silver ore, considerable time is saved and a slightly increased extraction obtained if crushing in the solvent be resorted to. For the treatment of clean sand by percolation, more particularly silver-bearing material, two, and even in some cases five, treatments have been found profitable. The handling of this material can be economically performed by the use of the Blaisdell excavating, distributing and conveying apparatus. In a skillfully designed plant, sand may be moved from one vat to another, using the above machinery, for approximately one cent per ton, and the extraction and profits enormously increased.

As an instance of the fallacy of attempting to fit the methods of one country to the ores of another,

may be mentioned the case of Western Australian ores and those of Cripple Creek, Colorado. In the former case, fine grinding is distinctly necessary to fit the raw ore for the highest commercial extraction, while at Cripple Creek an almost equally good extraction may be obtained at 30-mesh as at 200-mesh, either by bromo-cyanide treatment of raw ore, or by simple cyanidation of the roasted ore. As a matter of fact, a considerably higher extraction may be obtained on the roasted ore at 30-mesh than upon the raw ore, using bromo-cyanide at 200-mesh, and finer. The ore in both the above-mentioned districts has points in common, that is, that much of the gold in the material from the lower levels of the mines is combined with tellurium.

GODFREY DOVETON.

Denver, Colo., January 8, 1906.

THE DETERMINATION OF COPPER.

The Editor:

Sir—In the November, 1905, issue of the *Chemical Engineer* there appeared an article on 'The Determination of Copper' by Thorn Smith, Research Chemist, Ducktown Sulphur, Copper & Iron Co., Isabella, Tennessee. In the MINING AND SCIENTIFIC PRESS of November 11, 1905, there appeared a short article on a method for the 'Determination of Copper in Slags,' which I have successfully used for the past four years

A careful comparison of these articles shows the methods to be almost identical, and thus Mr. Smith's statement that "for simplicity, speed or accuracy no method has ever been published that approaches the above" is incorrect. To prove that this so-called "Thorn Smith method" has been in use by me I can refer those interested to Mr. Charles F. Shelby, Smelter Superintendent Old Dominion Copper Mining & Smelting Co. at Globe, Arizona, and Mr. Randolph Van Liew, his predecessor. The method is an excellent one, and has at all times given satisfaction. The intention of this letter is merely to call attention to the fact that this method is no new one and that Western copper chemists are not necessarily so slow as some would make them.

HENRY A. TOBELMANN.

Roosevelt, Arizona, January 18, 1906.

MINING ENGINEERS AND GEOLOGISTS.

The Editor:

Sir—In Mr. Forbes Rickard's contribution on this subject, I believe he expresses the sentiments of the majority of engineers throughout the country; I know he thoroughly expresses mine. I shall go a step further and give the feeling that I believe exists in many cases between the mining engineer and the mining superintendent and his lieutenants (foreman and bosses).

We of the engineering profession are very apt to underrate the intelligence and ability of the average superintendent; we go to a mine in the capacity of examining engineer or consulting engineer and meet him, but our dealings and conversation are confined mainly to the manager, consequently our acquaintance with the superintendent is slight.

I have the utmost respect for the superintendent, and with him are included the foreman and bosses; in many cases they are what the engineer is not—but should be—cool, level-headed men of horse-sense, with a thorough knowledge of mining. They know what a shift's work is and when it is being properly done, they know when a set of timbers is put in correctly, and a thousand and one other things essential to good mining. They are men who have, as a rule, started as 'muckers' or 'trammers,' and by hard steady work, have pulled themselves to the top of their ladder.

You may say that that is their business and not an engineer's. I don't agree with you; I believe that every engineer should, at the outset, put in several years in purely practical mining and milling. How many have done that?

It has been my good fortune, though I did not feel so at the time, to put in nearly four years underground as a miner; I feel that I know the superintendent, as a man, about as well as most engineers. Let me advise the coming generation of engineers to take every chance of becoming better acquainted with this man; he makes a good friend and a hard enemy. As a rule, at the outset, he won't like you, for he has had some bitter experiences with your predecessors, he has been snubbed, his ideas scoffed and his intelligence underrated, but "make good" with him by letting him know that his ideas are worth something, as well as your own, and your early troubles will be greatly lightened. This advice should be taken by many older engineers also.

To the past and present generations of engineers I should like to relate my methods of dealing with the type of man in question: I first try to gain his goodwill and friendship by talking upon some subject in common; if I am fortunate and succeed in gaining his friendship, we are upon solid ground, and I can get his ideas upon the locality, the mine, the orebodies and what not; I find that I obtain information that proves of great benefit to me, and in return I can give him a few good ideas; he is always glad to receive them, provided they are given in a friendly manner.

I am frank to say that I have received better treatment from this class of men than from those of my own profession; don't misunderstand me, I mean that I have received more good information on certain subjects of our profession from superintendents and foremen than from engineers whom I have met, and that information has always been given freely, with the earnest invitation to "Call again at any old time."

This is the spirit that should exist between the superintendent and the engineer, and in the long run I believe the engineer, as well as the superintendent, would be greatly benefited by such closer relations.

The requirements of a good mining engineer cover a wide field of study and experience—geology, metallurgy, surveying, mine valuation and numerous other subjects—but to my way of reasoning the qualifications that stand foremost on the list are good, business horse-sense, and an intimate knowledge of practical mining and milling. In the matters last mentioned, the superintendent can do worlds for you, if you will only get to know him.

Denver, January 10, 1906. H. R. PLATE.

Mining in Spain.

Mining in Spain has been stimulated by the high prices of copper and lead. There is a revival of interest in London, due chiefly to the favorable results so far obtained in the opening of the old Roman mines at Cerro Muriano, near Cordoba. John Taylor & Sons are the engineers and Henry F. Collins is manager, so that two old Cornish families are well represented. The former Roman workings were found to extend to a depth of 212 meters, but good copper ore has been discovered at the 250-meter level and the shaft is now being sunk to the 300-meter level. The mine is wet, a fine Hathorn-Davey compound pump being employed to raise 400 gal. per minute. The ore is copper pyrite and contains no precious metal.

Pozo Ancho Mine. Spain.

The accompanying illustration shows a new steel head-frame recently erected at the old Pozo Ancho mine of the Linares Lead Mining Company. It is 60 ft. high to center of sheaves, the lower third sheave being intended for the steam capstan that handles the pumps. The shaft is called Peill's shaft and is now down to the 1,680-ft. level. Double deck cages are used, winding being at the rate of 800 to 1,000 ft. per minute.

The old Alamillos and Fortuna companies are doing fairly well, the former having just bought a new property called the San Francisco, which had been worked to a depth of about 300 ft. twenty years ago. It is being re-opened and equipped with new machinery, with excellent prospects.

CONSUMPTION OF COPPER.—L. Vogelstein & Co. report the following figures indicating the German consumption of foreign copper for the months of January to November, 1905, as compared with the same period in 1904 and 1903:

	1905. Tons.	1904. Tons.	1903. Tons
Imports	100,793	107,364	80,093
Exports	11,114	8,145	9,328
Consumption	89,679	99,219	70,765

Out of the above, 83,992 tons were imported from the United States.

Electricity in the Black Hills.

The mines of the Black Hills, South Dakota, are about to receive the benefits of electric power. This is the greatest boon that has befallen the region since the introduction of the cyanide process. It will make possible the working of mines which hitherto have been too isolated or have possessed ore of so low a grade that it did not pay to work.

The new power plant completed at Pluma by the Consolidated Light & Power Company is thoroughly modern and best equipped. It has a stack, 210 ft. high, of steel and concrete, and a battery of seven boilers with a capacity of 2,200 h. p.; two 1,500-kw. turbines; one 500 and two 300-kw. turbines, and a total electrical power of 6,000 h. p. The stations are all built so that the boilers and turbines are in duplicate, each having its own individual condensing unit and auxiliaries. The switch-board will be six feet by 40 ft., having separate panels for the different power circuits. It will also have modern instruments for ascertaining conditions both on the line and in the plant. The company is now engaged in building a pole-line which will be 30 miles long, and when completed will connect the plant with all the mining companies in the northern Hills. Already the Lundborg-Dorr mill at Terry, one of the most successful and profitable plants in the district, is availing itself of this electric power. The Gilt Edge-Maid, which is also treating ore at a minimum cost, has electric power, not only for its mill, but for its hoist. This company and the Rex Mining Company have the only electric hoists in the Black Hills. A line is now being built for a large pumping station at the Ben Hur, one of the Horseshoe properties, and it is expected that by the first of June the work of connecting the various mining companies with the plant will be completed. It is estimated that the company will be able to furnish power from 20 to 50 per cent cheaper than it can be produced at the individual mines; the present cost of power to the mining companies is from 30 to 36 cents per ton milled, and electric power can be furnished for from 19 to 25 cents. When a company mills from 250 to 500 tons of ore per day, the saving of from 11 to 14 cents per ton will be no small item. It is not merely in the saving on low-grade ore that electricity will prove of benefit to the Hills, but it will also make it possible to operate properties that hitherto have been practically inaccessible. Big strides may now be looked for within the present year owing to these new facilities for operating low-grade propositions.

This electric plant also furnishes lights for Lead, Deadwood, Terry and Central. Mr. J. W. Springer has been in charge of the erection.

TO SECURE A PATENT IN MEXICO.—To secure a patent in Mexico the party making application (unless present in person), must furnish his representative with a letter of authority (*carta-poder*) in Spanish, signed by himself in presence of two witnesses. Ordinarily legalization by a Mexican consul is not required. Each application for either patent or trade-mark must be accompanied by a separate *carta-poder*. This must be accompanied by a full and complete description, and claims of, and for, the invention. If they are sent in Spanish ready for filing they must be in triplicate, on clear white paper 13 by 18½ in., written with typewriter on one side only of the paper, leaving on each sheet a left-hand margin of one-fourth the width of the paper. Drawings must be on white drawing paper equal to three-sheet Bristol, accompanied by two exact copies on tracing cloth, the size approximately 15 in. high by 10 in. wide, a heavy line one inch from the edges of the paper forming a rectangle within which the drawing must appear. A space of not less than one inch should be left above and below the drawings and within the rectangle for patent-office use. The drawings must be entirely free from signatures, writing, or marking of any kind except the letters or figures of reference to the specifications. They should be executed with the least possible number of lines or shading, and should be done with India or China ink. One of the drawings must show the complete invention. Drawings must not be folded. They should be sent flat or carefully rolled. Blank forms for letter of authority will be furnished to applicants by any regular patent attorney or solicitor. Any person desiring to obtain a patent may save all trouble and fully accomplish the object by communicating with the person whom he desires to have act as his representative or attorney, sending him the *carta-poder* duly signed and witnessed, a simple copy of his United States patent, or patent issued by any other country, or a copy of his specifications and claims written on a typewriter.

Radium is a substance which is perhaps millions of times more powerful than dynamite. Thus it is estimated that an ounce of radium would contain enough power to raise 10,000 tons a mile above earth's surface. Another way of stating the same estimate is this: The energy needed to tow a ship of 12,000 tons a distance of 6 000 sea miles at 15 knots is contained in 22 oz. of radium.

Block-Faulting and Its Relation to Ore Deposition.

Written for the MINING AND SCIENTIFIC PRESS by WALTER P. JENNEY.

It is in the Great Basin, lying between the Sierra Nevada and the Rocky Mountains, that block-faulting has its greatest exemplification. The region is characterized by numerous small mountain ranges coursing slightly west of north, conforming in general direction to the mountain systems on either flank. All of these are, however, not so regular in structure; interspersed, are island-like areas of diverse upheaval and associated volcanic rocks, which in some instances are productive mining districts. The peculiar structural features were early recognized by members of the United States Geological Survey and described as the 'Basin Range Structure.' The varied displacements of the strata by the more prominent folds and faults, the process of mountain building, and the evolution of the varied uplifts, are treated in detail in the monographs of the Survey. Little, however, has been written of the block-faulting incidental to the structural development of the Great Basin; most of the leading text-books on geology are silent on this subject.

Block-faulting is not confined strictly to the limits of the Basin, but occurs in the marginal ranges as well, and in many outlying areas of igneous disturbance in Nevada, southern California, Arizona, Utah and Idaho. It is also observed in the Black Hills of South Dakota and Wyoming, a solitary uplift in the great plains east of the Rocky Mountains—a region distinguished by the occurrence, at different geologic epochs, of volcanic outbursts giving rise to the formation of mineral deposits. Now that attention is drawn to it, there is reason to anticipate that block-faulting will be recognized in volcanic regions in other parts of the world. The intimate association of igneous rocks, and of block-faulting of the strata, with the occurrence of ore-deposits, is a subject which deserves careful study. In this paper, I will set forth the influence, in a special locality, of block-faulting in the preliminary preparation of the strata to receive the mineral, in the formation of the vein-fissures and verticals, and in the localization of the ore both in the fissures and in sheet-deposits replacing the stratified rocks.

The occurrence of this singular type of fault-structure is best understood by the examination of the conditions under which it has taken place.

First, there has been a distribution of intense volcanic energy over a broad basin or trough, almost continental in its extent, confined as if held between the jaws of a press, by the mountain systems on the east and on the west. Further, these mountain ranges are in themselves great fissure belts, zones of weakness in the earth's crust, the prominent 'feature-lines' of the North American continent. Dana, writing of continent-building, says: "These feature-lines have been successively developed with the progress of geological history—the system had its foundation in the beginning of the earth's genesis and was developed to full completion with its growth."*

Second, there are in the Great Basin evidences of many interrupted and recurrent volcanic outbursts; some at least, and possibly the larger number, were violent explosive eruptions, in contra-distinction to the quiet outpourings of lava which occurred in other localities, notably in the valley of Snake River, Idaho.

Third, the grandest exhibition of volcanic energy on this continent occurred during the Tertiary, and it is significant that most of the block-faulting has taken place during that period. It is probable that the larger proportion of the ore-deposits of the Great Basin are post-Miocene in age; the last geologic event of importance was the deposition of the ore. Post-mineral faults are rare; in some few instances, 'living' faults † occur which date back in origin to the earliest volcanic disturbance in the region—to eruptions, the time of occurrence of which we know little, except that they were post-Carboniferous. It is extremely rare to find in any of the mining districts of the Great Basin an igneous dike which has been intruded subsequent to the formation of the ore, although in a few places recent basaltic lavas are found only a few miles distant from mineral-bearing areas. Near Lost River and the Malad, in Idaho, in the marginal belt of the great Snake River lava-flow, there are extinct volcanoes, with outpourings of lava so recent that the rock is as fresh in appearance as if erupted in the last few centuries. In the monograph on Lake Bonneville, Gilbert describes similar recent lavas of southern Utah.

Fourth, the special dynamic disturbance causing the displacement was usually local, or, if regional, was of limited areal extent. In some instances the action was so sudden and violent that the strata were broken in blocks of immense size, without the lapse of sufficient time to admit of the rocks bending under the stress. In areas where the manifestations of dynamic force are greatest, disrupted blocks of strata, measuring 300 to 2,000 ft., and even more, across, are readjusted in positions such that the dip and strike of the beds in the several blocks is in diverse directions. Fractured blocks of less size are seen to be tilted, or set on edge, overturned, and less often are slid one over the other. This form of block-faulting is exhibited at Tintic district, Utah. An upheaval of Carboniferous limestone, two miles square, is surrounded on three sides by a much greater igneous area. At different epochs in the geologic history of that region, the sedimentary formation has been subject to abrupt compression produced by the intrusion of lava-masses in the volcanic border, and the consequent development of violent constrictive stress in the interior area. Large faulting-fissures cut the limestone into blocks, from one to ten acres in outcrop. The strike of the beds is often observed to change and the dip to be in a reverse direction in adjacent blocks. Naturally such abrupt changes in the stratification of the country have profoundly affected the course and dip of the veins in passing from block to block. There are, in the Tintic mountains, evidences of the occurrence of explosive volcanic eruptions, and other conditions which support the view that earthquake shocks may have been a factor in producing the fracturing. The movement of one wall of a fault-plane upon the other does not commonly take place all at once, neither is the motion uniform or continuous, but is interrupted and re-current; after a longer or shorter interval of rest, a sudden slip occurs, which produces more or less shock. That paroxysmal fissuring and faulting of the earth's crust give rise to earthquakes, is well recognized. It seems probable that the shattering and faulting

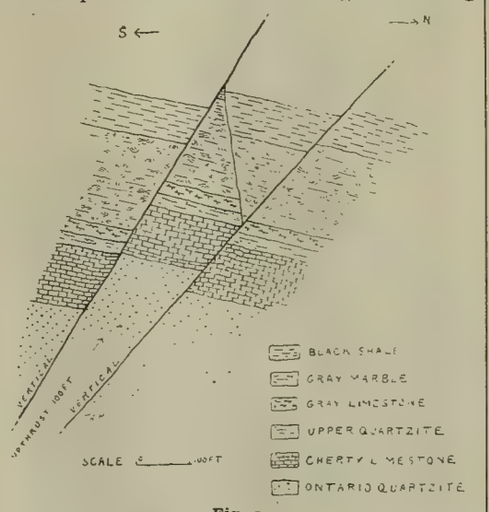

Fig. 1.

of any rock-mass under stress may be precipitated by such a shock. Further, the production of open fissures in the earth (in some instances miles in length) has frequently been observed to accompany the more severe earthquakes.

Where the conditions have been such that the dynamic effort has endured for a longer period, the strata are bent as well as fractured. A fine example of this is seen at Ophir canyon, Utah, where a dome-shaped uplift, two miles across, involving all the sedimentary formations of the mountain, is associated with block-faulting, which has caused comparatively little displacement of the bedding in the different blocks. Between the catastrophic type of block-faulting displayed at Tintic and the occurrence at Ophir of strata which have first undergone folding, and have been subsequently fractured, many intermediate forms exist.

Another type-form results from the subsidence of an igneous area at the conclusion of an eruption, due to the cooling and differential contraction of rocks of a diverse composition and structure, the re-adjustment of stress in the earth's outer crust, incident to expiring vulcanism. In some cases it is believed that during the progress of the eruption cavernous spaces were produced in the depths by steam displacing the molten lava and forcing it to the surface; with the dying-out of volcanic action, the collapse of the arch fractured and displaced the overlying formations. Block-faulting of this type may occur in the rocks surrounding a laccolith, and on a grander scale in mountain uplifts caused by the intrusion in the depths of the crust of immense masses of igneous rock. Russell describes this form of upheaval as "an uplift produced by a force acting from below directly upward, which has raised the strata into a dome." He advances the hypothesis that "they may have been elevated by molten magmas forced into the earth's crust, deep below the surface. The enlargement of these deeply seated bodies of intruded rocks may be likened to the growth of a tuber in the earth."‡ The term 'subtuberant mountains' is suggested. In some places it is observed, in approaching an axis of igneous upheaval, that a series of monoclinal folds of increasing intensity, giving rise to normal faults, is first passed over, succeeded by a down-thrown belt, in which the displacement is on the nucleal side of the uplift. Beyond the down-thrown belt a series of compensating faults elevate the strata, the block-faulting continuing until the volcanic nucleus is reached. Examples of this are seen in the Black Hills and along the flank of the Ontario mineral belt.

Fifth, the direction of the fault movement and the direction of the force producing it remain to be discussed. The most common form of block-faulting arises from the elevation of a region by a direct upthrust, followed later by compensating movements of subsidence. As has been stated, if the elevatory movement is slow and gradual, faulting may only take place in the re-adjustment of stress succeeding the uplift.

Examined in more detail, it is seen that block-faulting has been produced by a great variety of movements; often the displacements have resulted from a torsional stress,¶ and frequently in following a fault on its strike, the throw is found to increase or to diminish; such displacements are classed as radial. There are also overthrust faults and diagonal or 'splice' faults; 'wedge' faults are named from the shape of the displaced block.

In some mining districts faulting fissures are observed to radiate from one or more foci of dynamic effort (in this resembling the experiment of Daubree), and it is seen that often the largest orebodies are formed at such centers of multiple fissuring. The shunting of the throw from one fissure to another and the dispersion of the movement over a series of branching faults not infrequently takes place where the fissures intersect or are separated by narrow intervals, in this respect resembling shear-zones.

Block-faulting is commonly zonal or regional in occurrence and when produced by lateral thrust is characterized by the prevalence of reverse faults (compression displacements); when caused by less violent dynamic action, normal faults are most frequent, although in nearly every area where this structural form occurs, some reverse faults are found. It is seen that block-faulting is incidental to the development of the Basin Range structure, not only in the formation of great crustal blocks, but also in the subordinate fracturing and displacement; that it also occurs in the mountain chains contiguous to the Great Basin and in the Plateau region in association with igneous uplifts. It may result either directly, or incidentally, through the operation of any dynamic force. In many instances the law of normal faults that "the displaced block has gone down on the hanging wall of the fault, or that the corresponding block on the foot-wall has gone up," will apply to one side of an upthrust block, but not to the other. Such a condition is seen in the sketch of the upthrust block in the Daly–Judge mine (Fig. 2), where a block of strata is included between the normal fault and its companion, a reverse fault.

The standard works on structural geology and ore deposits, recognize shear-zones, but with this exception consider fault displacements, not collectively in groups, but singly, as if each individual fissure stood alone and did not form a unit of a complex system. The usual classification is one of form, based upon the direction of the throw, or upon the attitude of the fault, whether vertical, inclined or horizontal. A few are classified genetically, most important among which are the normal faults caused by gravity; there are also displacements due to the dilation of a rock, like peridotite, in its alteration to serpentine, and other displacements produced by the shrinkage of a sedimentary formation during solidification.

In conclusion, it has been shown that block-faulting may be local, confined to a limited area or district; or that it may be regional, occurring over a great basin; or that it may be zonal and pervade the fissure-belt of a mountain chain. That the system may include, among its units, almost every kind and description of faults, as well as occasional rare forms which have escaped classification. It should be borne in mind that in working out the details of a system of faults, the blocks of strata, considered with reference to their relative position are the important thing; the faulting fissures are only of interest (unless they are veins bearing ore or verticals which have brought in the mineral) in limiting or defining the boundaries of the several blocks.

Block-faulting may be defined as a phase of volcanic disturbance, giving rise to a system of faults with diverse displacement, which, according to the nature of the eruption which gave them birth, may be local, regional, or zonal in its distribution.

The Ontario mineral belt occurs where the Wasatch range, with a north-south trend, crosses almost at right angles and is superimposed upon the older Uinta mountain system. The east-west axis of the Uinta uplift has determined the general course of the mineral belt and of the more important ore-bearing veins, while the cross-veins conform to the structure-lines of the Wasatch range. Notwithstanding that this mining region is situated in the heart of a mountain chain some 30 miles away from the Great Basin, there is displayed a most interest-

* 'Characteristics of Volcanoes', by James J. Dana, p. 363.

† Faults which at the present day are subject to occasional though small, re-current movement of one wall upon the other are termed 'living faults'.

‡ 'Volcanoes of North America,' by Israel C. Russell, pp. 104–105.

¶ The experiment of Daubree in twisting a rectangular plate of mirror glass on which a coating of paper had been glued, affords a remarkably good illustration of block-faulting resulting from torsion. "He obtained two systems of cracks running obliquely to the plane of torsion." Beck's 'The Nature of Ore Deposits' (Weed's translation), pp. 171–172.

ing exhibit of block-faulting and of the inter-relation of volcanic disturbances, of post-igneous faulting and of ore-deposition.

Structural Features Produced by the Block-Faulting.—In the Daly-West and Daly-Judge, the faulted blocks of strata, united, form a triangular prism or wedge, base downward, traversing these mines in a southwest direction. This wedge-shaped structure is impressed by the relative position and the dip in an opposite direction, of the extreme bounding veins of the central fissured belt. On the north side is the Daly vein, dipping at 75° to the northwest, on the south side is the Back vein, dipping at 60° to the southeast. All the veins, fissures, verticals, and porphyry dikes of these mines are enclosed within this faulted wedge. Owing to the intimate relation and dependence of the ore deposits upon the faulting fissures through which the mineral has been introduced, all the ore now developed in these mines is similarly included. See Fig. 2.

The width of this fissured belt, measured from the Daly vein, southward to the Back vein, on the 900-ft. level of the Daly-West mine, is 1,700 ft. Assuming the dip of the veins bounding the wedge to continue uniform, and projecting them to the surface, the belt would there be narrowed in its outcrop, to a breadth of 400 to 500 ft. by the truncation of the upper edge of the wedge, due to erosion. Higher on the divide, the outer fissures may unite before reaching the surface.

Future exploration will undoubtedly develop outlying fissures in this mineral belt, both to the north of the Daly vein and to the south of the Back vein; but the larger prism that they make, without regard to the form its cross-section may assume, will include the fault-wedge described. (This actually occurs in the western part of the Ontario mine and in the Daly ground, where the prism is a parallelogram in cross-section, bounded by north-dipping veins). The interior structure of this wedge is marked by the occurrence of long and broad gently inclined troughs, formed by the subsidence of great blocks of strata, and bounded by the more prominent veins and faulting-fissures of the belt. Of these the most important is the main ore-channel, or 'Trough,' which is 900 to 1,000 ft. broad and more than a mile long. At the extreme east it is now being followed in the Daly property; there is reason to anticipate the extension of this trough in that direction through the ground along the south flank of the Ontario lode. In the workings of the Daly-Judge mine, this main channel, together with the down-thrown block or trough bordering it on the south, is continuing in ore, westerly. The fault-wedge has proved to be remarkably persistent throughout the mineral belt, and my opinion is that these sunken troughs will be found to be ore-bearing (where the local conditions were favorable for the deposition), so long as the union of the special geologic formation and the fissured zone continues.

The contour of the underground surface of the quartzite floor has had a strongly marked influence in limiting and defining the position of the ore deposits in the beds of gray limestone which rest upon it. The waters depositing the ore, on entering the strata, found the underground country with substantially its present faulted structure, and in their flow followed these troughs between the uplifted blocks, as if in a broad, shallow stream between high banks. The contact in the elevated blocks bounding these depressed troughs is seldom mineralized. In a number of places in the main channel the upper surface of the quartzite is polished and striated by the horizontal movement of the beds, which have slipped one upon the other. The direction of these lines of movement is north 60° to 70° east, conforming to the general course of the trough.

Prior to the mineral deposition, the rocks were prepared for the reception of ore by the fissuring of the strata, by the shattering of the beds in proximity to the verticals, by the breaking up and crushing of the gray limestone itself owing to drag of the beds one upon another, caused by the horizontal movement of the faulted blocks in the adjustment of diagonal upthrust and downthrow. Afterward these fissures and crushed beds were permeated by the wide-spread circulation of the mineralizing solutions, introduced through the verticals. In places where different fissures converge and intersect, the richest and largest bodies of ore are frequently found. This concentration of ore about centers or areas of fissure-intersection appears to result from the more complete and extensive fracturing and brecciation of the beds. The junction of the fissures tended to keep open the channels through which the solutions entered. This local concentration of ore in spaces of multiple fissuring holds equally true with respect to ore-shoots in the veins, formed in like manner by the intersection of the main fissure by verticals having different courses.

In no mining region is the general law of mineral deposition more rigidly followed, namely, that "*All workable deposits of ore occur in direct association with faulting-fissures traversing the strata, and with masses or beds of crushed and brecciated rock, produced by movements of disturbance. The undisturbed rocks are everywhere barren of ore.*" So true has this proved to be that it may be said, "*No ore deposit exists without a fissure or channel in the rock through which the mineral-forming waters were introduced.*"

Vertical Section of Daly-West Mine on Line of 900-Ft. Level, South Crosscut.

All dislocations preceded deposition of ore. Geology by WALTER P. JENNEY.

Lord Kelvin has shown that if a drop of water were magnified to the size of the earth the molecules of water would be of a size intermediate between that of a cricket ball and of a marable. Now each molecule contains three atoms, two being of hydrogen and one of oxygen. This molecular system probably presents some sort of analogy with that of a triple star; the three atoms, replacing the stars, revolving about one another is some sort of dance which cannot be exactly described.

Communities of atoms are called chemical combinations, and we know that they possess every degree of stability. The existence of some is so precarious that the chemist in his laboratory can barely retain them for a moment; others are so stubborn that he can barely break them up. In this case dissociation and reunion into new forms of communities are in incessant and spontaneous progress throughout the world.

Method of Exporting Chinese Coolies to the Transvaal.

Consul-General Ragsdale, of Tientsin, describes a system established, with the approval of the Chinese Government, for the enlistment of coolies for work in the mines of the Transvaal. The wages range from 1s. 6d. to 2s. 6d. per day, exclusive of subsistence, for the supply of which the contract makes provision. Mr. Ragsdale says:

During the last year a new industry has been introduced into China, and more particularly into north China. This is the exportation of indentured coolies to the Transvaal as unskilled laborers in the gold mines of the Witwatersrand district. Since the close of the South African war it has been found that the supply of native Kaffir labor was insufficient for the full development of the mines. Unskilled white labor has been tried on some of the mines, and has always resulted in failure, for the following reasons:

The climate is not suitable for the white man as a laborer.

The cost of living is so great that, for a white man to live in decency with his family, the wages necessary are much greater than the mining conditions will justify and the mines could not be worked. White men working for wages justified by the mines must be content to live in such a manner that they soon become degraded, lose their self-respect, and become a serious social menace.

It has been proven an impossibility for white and black laborers to work side by side.

Indian laborers have been tried without success. They are not good miners, can do but a small amount of work, and their strict rules of caste make it difficult to handle large bodies of them in an alien country. When the mines were re-opened, after the close of the South African war, the schedule of wages was less than before the war. As the lack of labor became a serious matter, the wages were increased in the hopes that the available labor would increase. These hopes did not materialize. The habits and instincts of the Kaffir are the same as the other natives of Africa. None of them are workers beyond what is absolutely necessary for a hand-to-mouth existence. Four or six months' work in the mines provides them with sufficient means to live the remainder of the year. The increase of wages instead of improving the labor conditions had an opposite effect, as the Kaffir could obtain the requisite amount of money in less time.

In addition to all this there is the fact that even if the native labor was satisfactory there are not a sufficient number of natives available. The entire population available for native workers is less than 4,700,000. As only those between the ages of 15 and 50 will undertake outside employment, the selection is limited to 10%, or 470,000. Dividing this by two, as the natives will not work more than six months each year, there is a total available supply, in the districts where recruiting is allowed, of 235,000. The present shortage in the Transvaal in all industrial and agri-

cultural operations is 220,000. The number of natives employed is 182,000, thus leaving only 53,000 to supply this immediate shortage, which in the Transvaal mining industry alone is 130,000. Thus will be seen the necessity of recruiting from some outside source, and from all sources available the most favorable is China, particularly north China. The Chinese are quiet, sober, hard workers, not given to dissipation of any kind, economical and thrifty, anxious to save all their wages possible and eventually return to China.

It must be remembered that the cost to the South African mining companies of the Chinese coolie is much greater than the cost of the Kaffir, and that the profit, if any, will consist in the greater capacity of work in the individual and the increased security of the mine owners against unexpected shortage. This experiment with indentured Chinese labor is the result of a thorough investigation of the labor question by the Transvaal Chamber of Mines, and the carrying on of the work in China is in the hands of a labor importation agency appointed by this Chamber of Mines. This work was sanctioned by the British Government by the passing of the Transvaal labor importation ordinance. The commissioners of the Transvaal Chamber of Mines arrived in China during the winter of 1903 and at once commenced negotiations with the Chinese Government in Peking for permission to export coolies. After completing in a satisfactory manner these necessary arrangements the commissioners inaugurated the actual work of collecting the coolies. Contracts for this work were given to two British firms in Tientsin—William R. Forbes & Co. and Chinese Engineering & Mining Company. For each coolie delivered at the port of embarkation and passed by the medical examiners a fixed sum is to be paid these contractors. The contractors pay all cost of collecting the coolies and supplying them with food and transportation to the point of delivery. Any coolies failing to pass the physical examination are a loss to the contractors. The contractors at once, through their *compradores*, established collecting stations in various parts of the provinces of Chihli and Shantung, from which went out small agents to preach the gospel of the Transvaal and collect coolies. The first shipments were collected from Tientsin and Tongshan; as the coolies were numerous and near. Later, as the coast supply decreased, the agents pushed inland.

The inland collecting stations were usually at some town having a resident foreign missionary doctor, who made a preliminary examination of the coolies before they were sent to the coast. This examination was at the expense of the contractors. The accepted coolies were marched to the nearest railway station and forwarded to the shipping point. In a short time Chinwangtao was made the main shipping point and an immense depot was established there. Near the beach, but well above the reach of the sea, was built a large compound, surrounded by a high brick wall. In this compound are 16 separate barracks, each 100 by 45 ft. with walls some 20 ft. high On the two sides of these are two wooden platforms six feet wide, one above the other, extending the entire length of the building, which are of brick, plastered on the inside, a lath and plaster ceiling, and cement floors. They contain ample windows and doors and in winter are furnished with large coal stoves—better quarters than the coolies ever had before.

The coolies arrive in lots of from two to three hundred and are placed in a small detention compound. Each one is stripped and examined by the doctors. This physical examination is most thorough, including tests for eyesight and hearing. Those accepted pass into an immense tank of warm water and are scrubbed with soap. They are then vaccinated, photographed, and their identification cards written up. A number is hung about their necks and they are ushered into the large compound, where they remain until the next transport sails. In the meantime they are furnished with a copy of the contract they are to sign both in Chinese and English. At all hours of the day special Chinese clerks take them individually and explain each clause of the contract in the simplest manner possible and in every detail, until each coolie understands where he is going, for what purpose, and under what conditions, and in what manner he will be repatriated.

These Chinese instructors are under the control of the Chinese protector, a British government official in no way connected with the Transvaal mines. His duties are to see that until the coolie leaves China the white man adheres, both in letter and spirit, to his part of the contract; that each coolie understands what engagement he is entering into, and that he enters into this engagement of his own free will and not because of outside pressure. While waiting for the transport the coolie, for the first time in his life, does no work, and has not a care, is clean, and has all the food and tea he wishes. He has no opium and no Chinese spirits. The change in the coolie is marvelous; he straightens and squares his shoulders, the wrinkles of worry disappear, and he simply exudes contentment. The shipping of the coolie is a slow process, as each must be examined by the doctors on the day of embarkation, and about four hundred per day is the limit.

The day before shipping, the coolies are taken in lots of ten to the office of the Chinese protector for a final examination in the catechism of what they are about to contract for. The questions asked are many and cover every possible point on which could hang a misunderstanding. These questions are propounded until all understand, when the coolies are thus addressed: "If there is any coolie here who regrets having come and does not wish to go to South Africa, let him come forward. Any of you are at perfect liberty to go home now if you so choose. There is no punishment and no money for you to pay if you have changed your minds. You have only to tell me and you may walk out of the compound and go home. The only requirement is that you leave Chinwangtao within twenty-four hours." Only about one in two hundred leaves at this point, and any excuse he may give is accepted by the Chinese protector.

The next day is the final medical examination and shipment. In a large hall stand or squat some two

Tongshan, China.

hundred coolies in rows along the wall. Their only clothing is a piece of string and a paper tag. In the next room are the doctors and Chinese clerks. The coolies come in one by one. They are compared with their identification card. If passed, they cross the room to a Chinese clerk who checks their name on the roll. They are then passed into the next room and

Office of Chinese Engineering & Mining Company.

into the tank, through which warm water constantly flows. Here they leave behind all remnants of Chinese dust, and, passing into the dressing room, put on new clean clothes, shoes, belts, socks, straw hats, etc , and re-appear in dark-blue uniforms, no longer mere Chinese, but wearing on the front of the coat in Chinese characters the legend *Nan Fei Li Kung.*

Chinese Making Bricks at Tongshan.

In the next room are three desks with Chinese clerks and a foreign supervisor. At the first the paper tag is changed for a lead disk with a number on it. This is fastened about his neck, and he is sent to the desk at which he arranges for a portion of his wages to be paid in China each month, to his wife, father, or other person designated by him. This is done by means of a coupon pass-book. Next he goes to the most interesting desk of all, the paymaster's. Here he receives $38 (Mexican), two months' pay, and $8 bonus. The majority never owned a silver dollar before. The money is laid out and counted in front of him. It is then pushed into a small tin pan, which will later serve him as a rice bowl, and he is passed to the next room, where he signs his contract, before which, however, he has one more chance to retreat if he so wishes. No one has ever retreated at this point.

The next room is a long hall divided lengthwise by an iron grating. On the one side the hall opens into the outside world; on the other into the compound. It is here that the South African laborer bids farewell to his family and creditors. It is not a pathetic sight. If his creditors leave him any of his newly acquired wealth his relatives argue with him for it, and fortunate the coolie who escapes to the next room with any money. Here he receives his kit bag containing a full winter outfit of clothes, blankets, a tin cup, and everything he can possibly need on the trip, including a small bamboo pillow with folding legs to serve as a seat by day. They walk out with their bags on their backs, enter the train, and are taken at once to the dock, where they are changed to a waiting lighter and towed to the transport. Everything is clean and comfortable for them. Rules prescribe the number allowed on each transport, and they sail away with no work to do for a month and all they can eat. They are a most cheerful crew.

Following are the results of this new industry to the present. The first shipment of coolies was made from south China in May, 1904. The total number of shipments from all ports to date is 29. The total number of coolies shipped from all parts of China is approximately 49,000. Of these, 28,000 have been exported from Chinwangtao and 5,500 from Chefoo. The number of deaths during the voyage have been only three or four per trip. In reference to the mortality among the coolies after arrival in South Africa, I am unable to procure exact data, as the records of the 15,500 shipped from south China are not available in Tientsin. But from statements published in Johannesburg the health of the coolies has been eminently satisfactory, with the exception of those exported from the southern provinces. This difference was so marked that all exportation from the south was soon stopped and only the strong, rugged northerner is now taken. Of the 33,500 taken from the north less than 300 have died from sickness. The total deaths have been 15.5 per thousand, of which 2.4 per thousand were due to accident. The number repatriated at the expense of the mines has been about 1,000, of which 204 were from the north. Less than 50 have returned to China at their own expense. Of the total number of coolies sent to Chinwangtao those rejected by the doctors after examination have amounted to about 30%, thus showing great care used in final selection and to some extent the lack of care in the collecting.

THE PROSPECTOR.

The small pieces of ore from Santa Ana, Cal., are lead and zinc sulphide.

The minerals from Ashland, Or., are: No. 1, from near hanging wall, quartz with pyrrhotite (magnetic iron sulphide); No. 2, center of vein quartz; No. 3, quartz with rotten granite; No. 4, quartz. This is not the real hanging wall, but a portion of the vein, and should be crosscut to the granite.

The ore from Darwin, Inyo county, Cal., is sphalerite (zinc sulphide), also called blende and black jack. The matrix is a dike rock.

Sample No. 1, from Palmetto, near Lida, Nev., is a silicified eruptive rock, in which is seen some very finely disseminated pyrite (invisible without aid of a strong glass) and some crystals of iron oxide. No. 2, from the same place, is largely limonite (brown iron oxide). This ore will contain iron and copper sulphide in depth, and possibly other sulphides as well. Both ores may contain gold and silver and should be assayed.

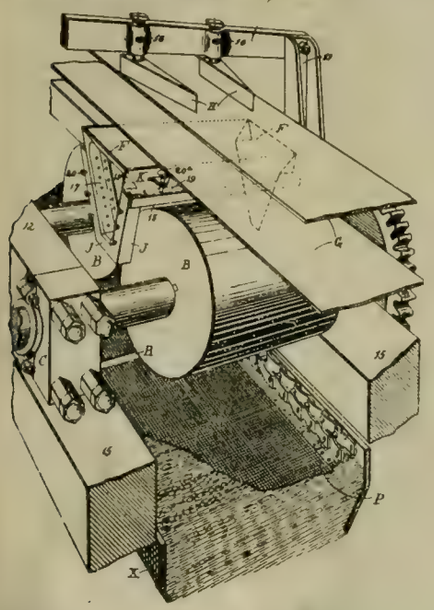
The rock samples, marked 'P. A. B.,' from Mexico are the following: No. 1, an altered, feldspathic intrusive rock, in which occurs numerous small crystals of hornblende. Pyrite also is seen disseminated and incrusting the fracture planes in the rock. This rock is probably a fine-grained syenite. No. 2 is a brecciated limestone. The fact that thermal springs exist in its vicinity does not necessarily indicate that the rock was deposited by the calcareous waters of the spring. Its appearance, on the contrary, leads to a contrary belief. No. 3 is quartz, in which appears a few small crystals of actinolite (hornblende). No. 4 is hornblende granite; that is, granite in which appears both hornblende and mica. No. 5 is syenite. No. 6 is aplite (micaless granite). No. 7 is a very much decayed granitic rock. The black mineral is tourmaline. No. 8 is lava (andesite). No. 9, 10 and 13 are the same kind of rock (norite), the bisilicate being mostly hornblende. No. 12 is apparently tuff, which has been somewhat metamorphosed, either by local causes or the metamorphism may be regional in its character. No. 11 has the appearance of dacite that has been subjected to intense pressure, resulting in slight deformation. Every crystal of quartz and feldspar has been shattered by the pressure, but has had only slight movement and little or no shearing. The ground-mass is much decayed.

Mining and Metallurgical Patents.

PATENTS ISSUED JANUARY 9, 1906.

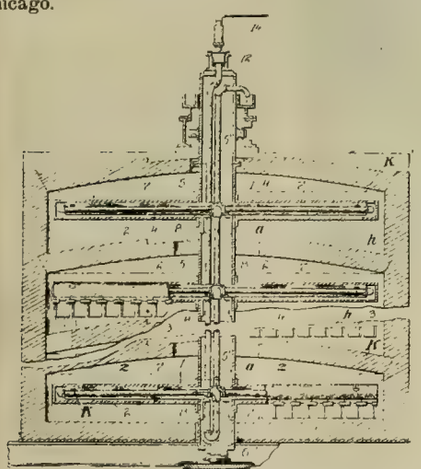
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

COMBINED APPARATUS FOR GRINDING OR CRUSHING, WASHING AND SEPARATING ORES. — No. 808,488; R. Stanley, Nuneaton, England.



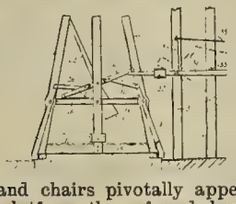
Apparatus for treatment of ores, comprising rolls between which the material is reduced to a coarsely ground condition, finishing rolls adapted to allow only a thin layer of material to pass between them, a traveling belt of gauze underneath the finishing rolls to catch the material falling therefrom, means for forcing the crushed material through the gauze into a trough below, means for redistributing the material that cannot pass through the gauze to the finishing rolls for regrinding.

ROASTING FURNACE.—No. 808,293; F. E. Marcy, Chicago.



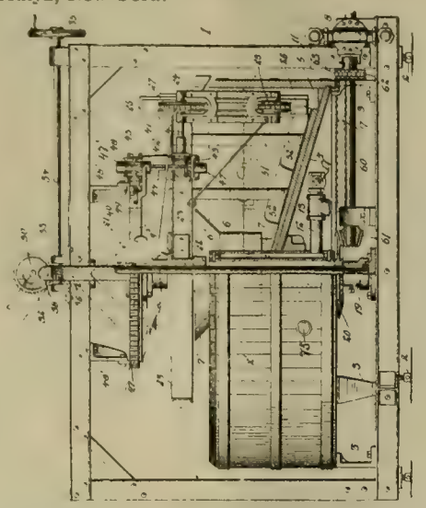
In a furnace having a plurality of hearths, a hollow rabble shaft passing through the hearths, a series of structural members radiating from the shaft and extending into the several hearths, a series of hollow arms passed over and supported by the structural members and forming air spaces or conduits therewith, an inlet pipe and a return in the shaft for conveying a cooling medium into and out of shaft, and a series of branches leading from the return into the conduits of the arms and enveloping the structural members within the arms for cooling members and arms.

LANDING CHAIR FOR MINING CAGES.—No. 809,176; G. H. Denton, Denver, Colorado.



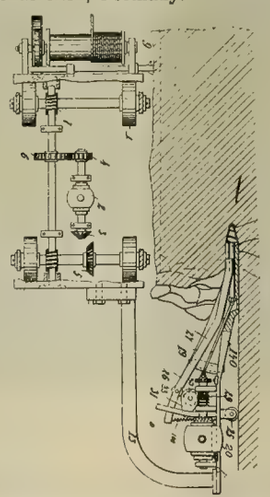
A cage, and chairs pivotally appended to cage, above the platform thereof and having horizontal portions below their pivots with seats disposed beneath platform of the cage.

GOLD-SEPARATOR.—No. 809,586; E. J. Sterling, Brooklyn, New York.



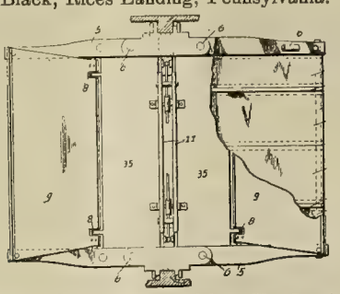
In a gold-separator, the combination of a tank, a circular rack above tank, a pipe projecting up through tank and having an exterior annular chamber provided with outlet-openings leading into tank, a rotatable shaft extending upwardly through pipe, means for operating shaft, a hub rotatable with and slidable on shaft, means for sliding hub on shaft, arms secured to hub, elevators rotatably mounted on arms, laterally extending shafts for operating elevators, shafts rotatably mounted on arms and having gears on their inner ends and upwardly extending shafts rotatably mounted on arms and having gears on their lower ends meshing with the gears on the laterally extending shafts and gears on their upper ends rotatable therewith and slidable thereon and meshing with circular rack.

COAL-MINING MACHINE.—No. 809,350; C. Wissemann, Gelsenkirchen, Germany.



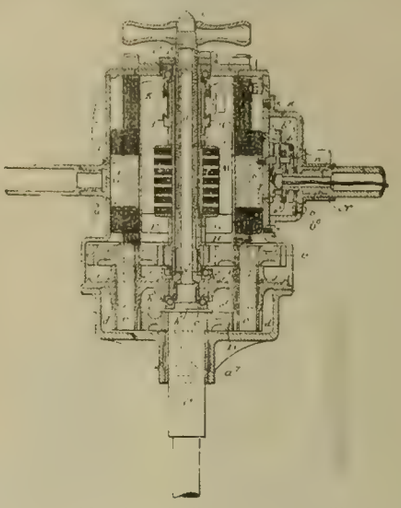
In a coal-mining machine, combination of motor-engine, with a series of borers arranged vertically one below the other and acting to drive holes parallel to the joints of the layers of coal, plates acting in the manner of wedges, the front ends of which enter the bore-holes, and means to rock plate on a pivot at forward ends.

CAGE FOR MINE AND ELEVATOR SHAFTS.—No. 809,899; W. Black, Rices Landing, Pennsylvania.



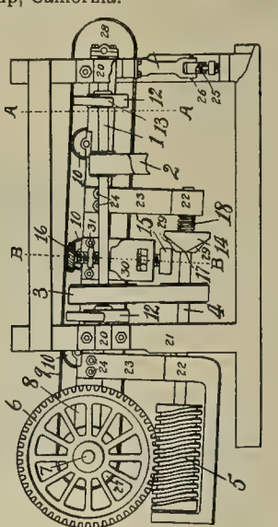
A cage of the type comprising sills, flooring supported by sills, flooring consisting of channel-shaped plates and braces extending through the depending edges of plates, through sills a track supported on flooring, bolsters from which the sills are supported and vertical and oblique braces connecting bolsters with sills.

ELECTRICALLY OPERATED PORTABLE DRILL.—No. 809,394; A. Pedersen, Cleveland, Ohio.



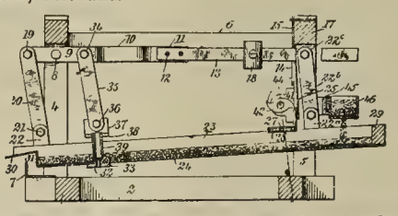
In a portable electrically operated drill, the combination of a multipolar motor provided with a casing and mounted within the latter and having a hollow shaft; a feed-screw mounted within and co-axial with shaft; a drill-spindle mounted in one end of the casing and having its axis in the same straight line with the motor's axis; a removable head secured to the other end of casing; intermediate gearing connecting motor and spindle; a diaphragm located transversely of line of the motor-axis, one end of shaft being supported by head and the other by diaphragm; binding-bolts passing through head and between separate field-sections and having their inner ends secured to diaphragm; and a controller for motor having its resistance coils mounted upon binding-bolts.

FRUE CONCENTRATOR.—No. 809,648; L. R. Tulloch, Angels Camp, California.



In a concentrator, the combination of a shaft, means for revolving shaft, a worm thereon, a frame, drums on frame, an endless concentrating belt around drums, a worm-wheel meshing with worm and operatively connected with one of drums to revolve it, and positive means independent of the connection with worm-wheel for imparting a longitudinal reciprocation to shaft, whereby is produced a comparatively rapid oscillation of the worm-wheel and a corresponding longitudinal reciprocation of the belt in addition to its slow advance.

ORE-CONCENTRATOR.—No. 809,765; G. M. Whitney, Lawson, Colorado.



An ore-concentrator, comprising a bed for the ore to be separated, tubes therethrough for the discharge of the mineral portions of the material, other tubes having movable relation with first-named tubes for regulating such discharge, a supporting member for the second-mentioned tubes, and a vertically-swinging member connected with the supporting member.

A New Gold Dredge.

Written for the MINING AND SCIENTIFIC PRESS by GEORGE L. HURST.

The gold dredge, like the trusts, continues to grow larger and larger, and the day is not far distant when we shall see dredges with buckets each holding one cubic yard. This tendency to enlargement is indicated by a dredge provided with buckets of 7-ft. capacity recently built at El Dorado, on the American river. This machine will dig from a depth of 35 ft. below the surface of the water and elevate tailing to 38 ft. above water, so that it can work a bank at least 15 ft. above water level; in other words, dredging is possible to a total depth of 50 feet.

The hull is 94 ft. long, 34 ft. wide, and 30 ft. deep. The increased width over the 5-ft. dredge is very noticeable and makes the boat much more comfortable. The main ladder consists of a heavy plated girder with ½-in. side-plates, 42 in. deep in the center and tapered off to 30 in. at each end. The lower end carries a pentagonal cast-steel tumbler lined with manganese-steel wearing plates on both the treads and flanges.

The shaft is provided with special steel bushings and revolves in the hardest kind of white iron bushings enclosed in a cast-steel cap, which prevents the grit and water getting in the bearings. The ladder end proper is made of heavy cast-steel side-plates heavily flanged and ribbed, and riveted to both angles and side-plates of the main ladder. The ladder is provided with steel chafing-rollers running against the steel plates bolted to the hull, which gives a smoother motion than beams and reduces the wear and tear to a minimum. The bucket-belt travels upon manganese-steel rollers running in enclosed grease-cup bearings, which system of lubrication is used for all parts subject to water and grit, and has proved successful.

The bucket-belt consists of 37 heavy substantial buckets, each of 7 cu. ft. capacity, with a wide open mouth so as to facilitate dumping. These buckets have locomotive tire steel links with manganese-steel bushings and 1 in. flanged steel bottoms. The back and end are made in one piece, being flanged in a special press, thus doing away with the end piece which is always working loose and losing valuable material, to say nothing of the cost of repair. This back is also re-enforced with a heavy side-plate. The lips are of manganese steel 9 in. wide and 1½ in. thick. The buckets are connected together with cast-steel links and forged manganese pins, these pins running in manganese-steel bushings. The top tumbler, which drives this bucket-line, is square and almost solid. The shaft is a special grade of steel to withstand heavy shocks. The tumbler body is made of cast steel and the wearing corners of manganese steel clamped to same with square bolts.

The main and side gantries which carry the tumbler and countershafts are of steel throughout and have proved absolutely rigid. This would seem to be an unnecessary expense, but the extra first cost will be far more than counterbalanced by the increased stability over wooden gantries, especially in a dry climate. However well the timber is fitted, the excessive heat and dryness cause the joints to shrink, which necessitates constant tightening up of bolts, etc. The main top tumbler bearings are of cast steel and form an integral part of the steel gantry, thus doing away with sole-plates, keys, and bolts.

The main bucket-line is driven through a chain of gears and one belt by a 75 h. p. variable speed motor taking a 3-phase alternating current at 440 volts. The average horsepower consumed is about 40 h. p. when dumping 12½ buckets per minute. The material drops into a steel delivery plate which delivers it into the revolving screen. After the buckets dump they are washed out with two jets of water, one on each side. Any material which does not fall on the delivery plate is caught on what is called the save-all grizzley, which is below the delivery plate and runs further forward, and the buckets are again washed out by more jets, thus cleaning them thoroughly before they leave the dredge to pick up another load.

The revolving screen is 4 ft. 6 in. diam. by 30 ft. long, perforated with ⅝-in. holes. The perforated plates are carried on T bars and one or all of these perforated plates can be taken out without taking the screen down, thus enabling new wearing plates to be put in without delay. The screen carries at its lower end a heavy cast-steel ring. Under this ring is a cast-iron self-contained bed-plate carrying friction rollers driven by steel bevel wheels, all bearings being brass bushed and having the end thrust taken up by fiber washers. The brasses are made interchangeable and reversible. The top end of the screen also carries a cast-steel tread which revolves on cast-steel rollers running in cast-iron chairs bolted to main steel gantry. The screen is driven by a 10-h. p. motor through a belt and a set of cast-steel gearing. The motor is situated above the screen and out of the way of all splash and dirt.

The revolving screen delivers the coarse material direct to the stacker buckets by means of a flat shoot. These stacker buckets are of the Risdon standard type; they are carried on manganese-steel rollers supported by steel I-beams. Both top and bottom tumblers are cast steel and fitted with renewable steel corners. The top tumbler is driven by a 10-h. p. motor situated at the upper end of the elevator on a steel frame above the line of buckets. A belt connects this motor with a set of cast-steel gearing. Placing this motor up at the end of the elevator does away with a long rope drive and the steel I-beams are more than sufficient to carry the little extra weight of the motor.

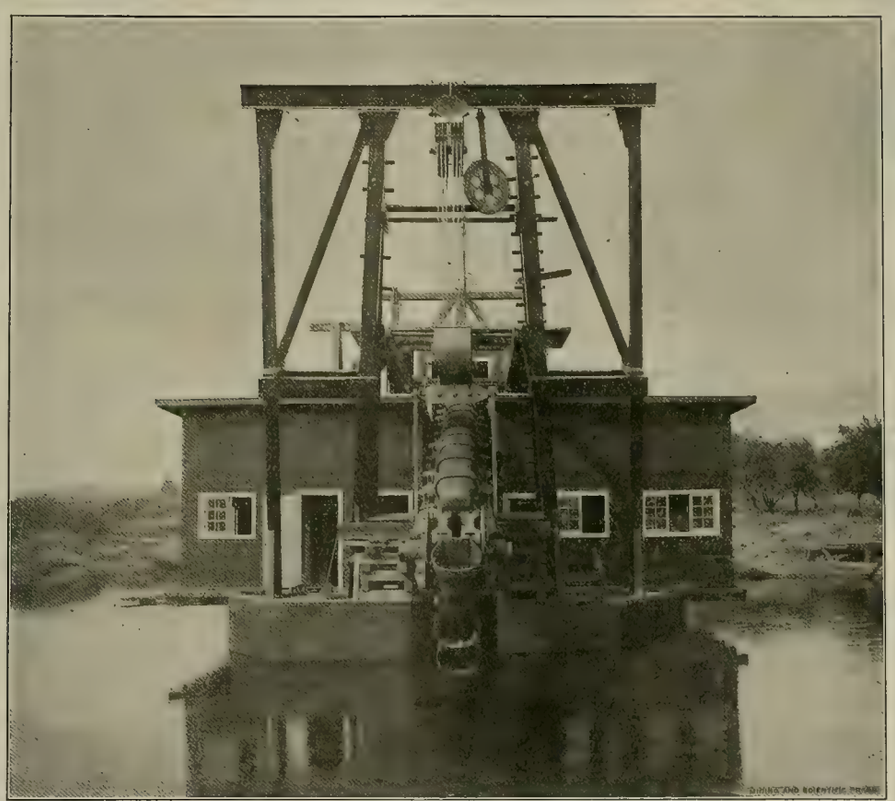
The water supply is furnished by a double centrifugal pump of special type, direct coupled to a 50-h. p. motor delivering water into the revolving screen and distributing box. The pump which delivers water into the revolving screen is called the high-pressure pump and the one which delivers water into the distributing box is termed the low-pressure pump. The pipe in the revolving screen is fitted with a set of nozzles 1¾ in. diam. instead of the old method of a plain perforated pipe. The water from these nozzles retards the material from passing too quickly through the screen and also breaks up any sticky material. The pressure of the water in this screen pipe is much higher than in the pipe which delivers the water to the distributing box, thus making the reason clear for using two pumps in place of one. The pump being direct-connected to the motor and designed to run at the correct speed does away with all belt troubles, etc. The distributing box consists of a steel box fitted with a patent distributing plate and adjustable side doors. This delivers the material equally, not only on both sides of the screen but equally to each table. The fine material which passes through the perforated screen falls onto this distributing plate, then passes to the various openings on the sides of the distributing box and then over the gold-saving tables fitted with matting and expanded metal. These tables are in two lengths and have a mercury trough between each length. The material from the tables passes into the sluice ways fitted with angle-iron riffles.

The winches of this dredge are practically steel throughout. All gears and pinions are steel, the high-speed ones being cut gears to do away with friction losses and unnecessary noise. The main winch is driven by a 15-h. p. variable speed motor which allows the winch to be operated as desired. The operating handles for this winch work in quadrants of the locomotive type and are all brought to one platform, one handle for each of the four side-line drums. The design is such that the movement of one handle enables a drum to be instantly set in motion, allowed to run loose, or held by the brake. Each drum is entirely independent and can be operated in any way regardless of the conditions of the other one, whether driven loose or held. This prevents any delay in changing positions of the dredge and together with the independent ladder winch increases the actual capacity of the dredge probably 30% over the old style.

The head line is operated by a slow running drum, the line passes from the drum to a snatch-block ashore and returns to the other side of the dredge, giving a steady but powerful advance to the dredge and also distributing the digging load onto both pontoons.

The ladder winch is entirely independent and consists of a 20-h. p. variable speed motor fitted with brake and controller, by which the ladder can be raised or lowered. All the machinery is housed in with a flat roof covered with canvas. Above the screen there is a second story which makes a nice store-room and gives one a good opportunity to watch the moving machinery. At the forward end of the starboard pontoon is situated a gangplank supported at the outer end from the top of the front gantry by a set of small blocks and hand winch. This gangplank can be raised and lowered so that it is unnecessary to take a boat to get on board the dredge, and when not in use it can be raised out of the way.

The whole of the plant is of the most substantial design. The ladder and buckets loaded weigh 45 tons and the steel gantry 28 tons. The average daily capacity of this dredge is estimated at 3000 cu. yd. bank measurement. The crew consists of two men per shift and the power used about 95 to 100 h. p.; the daily cost of wages, electric power and up-keep ought not to exceed $100 per day. The dredge has in the neighborhood of 250 tons of machinery on board and costs about $75,000 in complete running order.

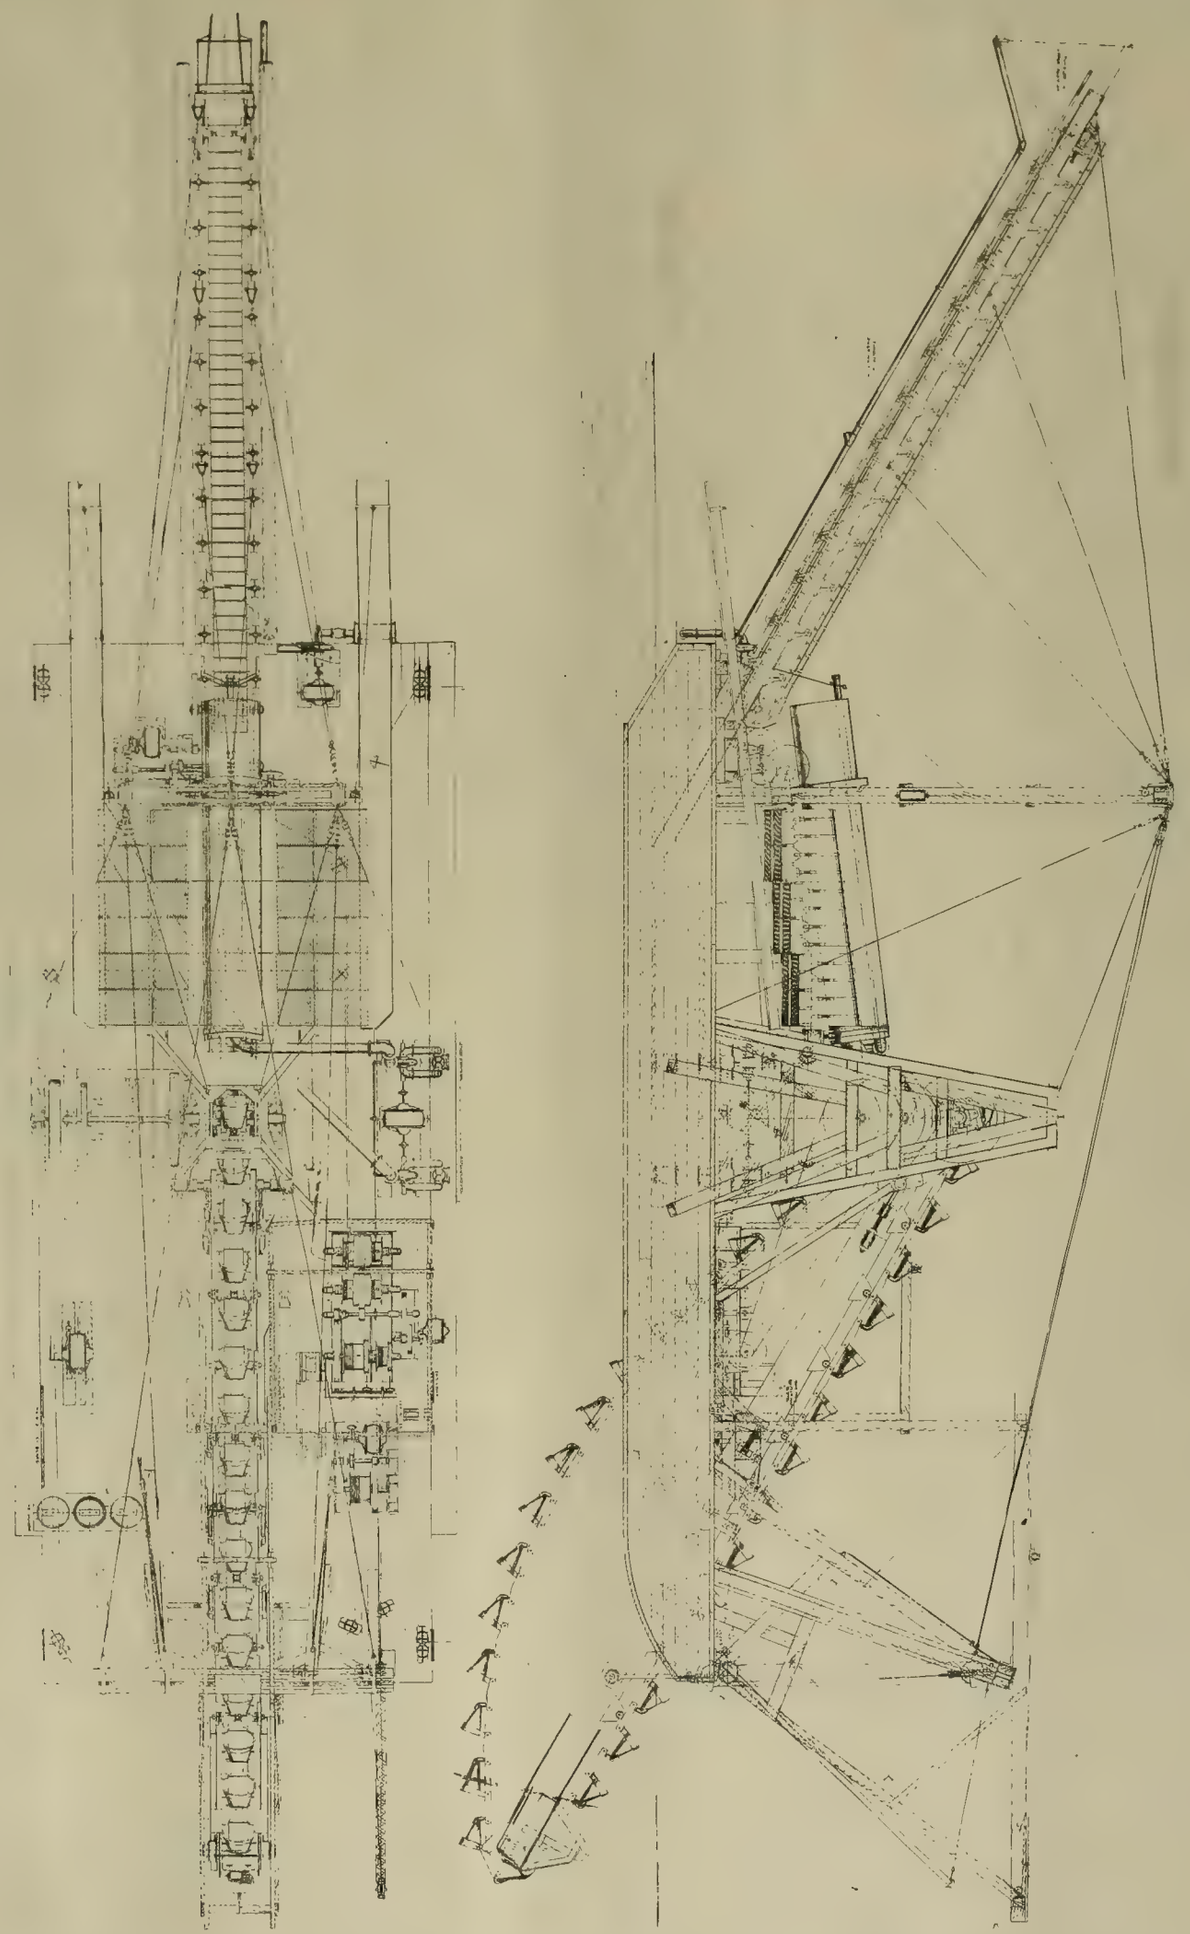


New Dredge at El Dorado, on the American River.

BENDIGO SADDLE-REEFS.—There is no replacement of the country rock by quartz; the opposite sides of the jagged walls of the 'spurs' in many cases would fit closely if joined again. The quartz is milk-white and almost glassy; it would be regarded with much disfavor by many miners of this country and contemptuously designated as 'bull-quartz.' Extremely little evidence of pressure and crushing is seen. Quartz with thin intercalated sheets of slate is not uncommon, and this occurrence, as well as many other facts, lends much support to the view, also advocated by Mr. Dunn, that the expanding force of crystallization has aided in creati ng the necessary cavities for deposition. Carbonates containing lime, magnesia and iron in places mingle with the quartz and very frequently line the walls of the fissures. To some extent these carbonates also replace the slate adjoining the veins. Chlorite is sometimes found embedded in the quartz to which it imparts a dark greenish tinge. It is well crystallized in minute bent and curved prisms. The sulphides are generally limited to pyrite and arsenopyrite, with a little galena. The two first-named minerals seem most abundant in the slate immediately adjoining the quartz. At the contact, cubes of pyrite are sometimes seen, of which one-half is embedded in quartz and the other half in the black slate.—W. Lindgren, in *Economic Geology*.

THERE is a tendency to increase the weight of stamps in the South African mills. At the Simmer & Jack the falling weight of the new stamps is to be 1,415 lb. Several companies have ordered stamps of 1,350-lb. weight. This development is accompanied by the use of tube-mills, a rapid coarse crushing in the battery being followed by re-grinding in tube-mills.

THE unusually good photograph of the Old Dominion smelter at Globe, Arizona, appearing in our issue of December 23, was contributed by Mr. George H. Twaites of Globe. By an oversight this acknowledgment was omitted.



THE EL DORADO DREDGE.

Built by The Risdon Iron & Locomotive Works, San Francisco.

Designed by R. H. Postlethwaite.

MINING SUMMARY.

Specially Compiled and Reported for the MINING AND SCIENTIFIC PRESS.

Special Correspondence.

LONDON, January 6, 1906.

When the other night at the Albert Hall the new Premier launched his diatribes against "Chinese Slavery" and roused an appreciative audience (very few of whom probably held Kaffir shares), many supposed that South African mining had received a very bad one in the eye. The market, however, appears to regard such political fireworks as of less significance than the new Colonial Secretary's statement that the Government will retain its freedom of action until the local voice on the subject can be properly heard. Beside, it is now contended on high legal authority announced in the *Standard* that the ordinance for the importation of Chinese coolies, passed by the Transvaal Government in February, 1904, and sanctioned by the King, has become law and cannot be revised, except by His Majesty alone in Privy Council. Meantime the supporters of indentured yellow labor are bestirring themselves to educate public opinion. The Imperial South African Association, in connection with which no less a personage than the Duke of Westminster lends his great wealth and personal influence as President, has called to its aid the powerful advocacy of two prominent members of the Progressive Association of the Transvaal—Messrs. Reid and Rodgers. These gentlemen, while declaring that they have a perfectly free hand, indicate, by opinions already expressed, their strong conviction that unskilled whites cannot possibly meet the demand for cheap labor in the Transvaal for the development of the mining industry so absolutely necessary to support the increasing white population. Messrs. Reid and Rodgers insist on the proposition that even if a sufficient native supply were available, it would be useless for future competitive work owing to its temporary and intermittent character. On the other hand, they point out that unskilled white labor is an impossibility in South Africa owing to the great cost of living. At the same time whites never will do Kaffirs' work, for should the white man lose his status before the natives, civil war will ensue. This argument is brought home by the reminder that the white population of the Transvaal is only 303,000 against 1,250,000 natives. Truths such as these from men thoroughly competent to speak on the subject should be sufficient for the thoughtful section of electors; but all the same, ignorant clamor and wilful misrepresentation will probably continue to be heard until the General Election is over. Meantime the South African mining industry goes steadily on, as evinced by December dividends—a goodly and substantial list—and by the increase (over £5,000,000) in the yield of gold from the Transvaal during the past year.

While the apathy of the general public in regard to Kaffir shares continues, the interest in American and Mexican mining is perceptibly growing. Activity and strength are the order of the day in the great copper shares, such as Anacondas and Bostons. In gold mines, Camp Birds, which, owing, it is said, to some rather heavy selling from your side, lost color at the end of the year, are again showing a firmer market, the quarterly distribution just made being one shilling per share compared with 9d. for the corresponding quarter of the previous year. The information available here concerning the mine leaves something to be desired from the shareholder's point of view, but according to reliable opinion, it is likely to maintain its high character as a regular and generous producer for years to come. The same remark as to mining data is applicable to Esperanza, but it may well be said that there cannot be much the matter with a mine that shows profits running from £75,000 upward for months on end. Those in the know predict that this sort of thing can be maintained for a prolonged period from ore reserves already blocked out. If so, the present price of £5⅜ cannot be described as excessive on merits, having regard to the relative smallness of the share capital—£455,000. El Oros are well maintained. There are great expectations from its new subsidiary—Somera—formed with a nominal capital of £500,000, of which £226,000 is working capital; in this undertaking El Oro Company, of course, retains a substantial interest.

Another Mexican mine, the Dolores, is gradually coming into favor. This mine is in the Guerrero district, State of Chihuahua. The directors of Dolores Limited (a flotation of the Venture Corporation), after a long wait of nearly two years, have issued a report. As a rule directors who know, or think, they have a good thing in hand are not bashful in showing up its good points, but all they have to say on the subject in this instance is that the mine belongs to Dolores Mines Company—the American Company. The report is a model of brevity. Profits? Oh dear no!, the "American Company" not having yet paid any dividends on the shares (nearly the whole of them) held by Dolores Ltd. The chapter—a history of one year and eight months in a dozen lines or so—is thus closed with an almost audible sigh of relief. That dividends are lacking is clear enough from the accounts of Dolores Mines Company which are appended to the meagre balance sheet of Dolores Ltd., the latter showing net liabilities amounting to some £2,500, to be cleared off out of future dividends which may come in. The accounts of the American Company show at a glance the inadequacy of the working capital of $145,500 as originally "received from stockholders." It has had to be supplemented by loans amounting to some $200,500. This amount presumably must be paid off together with a sum of $50,000 due under a contract (for what purpose it is not stated) before profits become available for dividends. The operating account is for two months only—the last of the 13 months to June 30, 1905, covered by the accounts. It shows a net profit, after providing for all working expenses at the mine and New York charges, of $8,997.55. Shareholders are left with the reflection that from small beginnings large issues may result. They will naturally turn from the accounts to the Consulting Engineer's report to see if some more inspiring thoughts can be made to flow from that fountain of information. Although no great enlightenment awaits the casual reader of this document, a careful observer may gather more than a few grains of useful knowledge from the material spread before him. The mine has an ample area—227½ acres with surface rights to some 12,500 acres affording a good supply of water and timber. Since the purchase, the equipment of the property has been of considerable importance, comprising as it does hoisting and air-compressor plants, pumping engine, two miles of pipe-line for water supply to the mill, all the buildings and the mill itself. The whole of this material had to be transported for a distance of over a hundred miles from the nearest railway station on mule-back through the mountains, with the trail on the higher summits repeatedly buried in snow and in the valleys rendered impassable by unprecedented floods. In spite of these difficulties, Mr. John B. Farish is able to boast that disinterested engineers who have seen it pronounce the equipment one of the finest sectional plants in the Sierra Madre mountains. The mine appears to be in an equally satisfactory condition. The former owners left a legacy to the company of 26,831 tons of ore in the reserves besides 11,000 tons on the dump, originally valued at $55 and $42 per ton, respectively, U. S. currency, divided about equally between gold and silver. The reserves have more recently been valued by Manager Hardy as averaging $66 per ton and it is also found in stoping ore for the mill that the vein is fully 20% wider than estimated. The orebody worked on the main, or Alma Maria, vein has been proved to extend for a length of about 600 ft. to a depth of over 400 ft. from surface, the bottom level being in rich ore. The main tunnel level intersected the Alma Maria vein at a vertical depth of 250 ft. from surface. This level in its extension north beyond the proved orebody, after passing through barren ground, encountered pay-ore for a distance of over 160 ft.; giving evidence, in the opinion of Mr. Farish, of being the top of a second ore-shoot. Besides the main vein there are other veins with a showing at surface similar to the Alma Maria vein. These are to be prospected in good time. The mill consists of a battery of 15 stamps, amalgamation pans, Bryan mills, tube-mill, etc., and cyanidation plant for the tailing. The mill started in May last and the Consulting Engineer expresses great satisfaction with its work so far as the amalgamation part is concerned and with the recovery, which he expects will be at least 85% of the gross values, when the cyanide plant is at work early in the new year. With regard to future profits Mr. Farish only states that they will come up to the estimates of the experts. What those estimates were is no secret as they were made known by the promoters of the company as somewhere about £100,000 per annum—or say 30% on the capitalization of £330,000. The capacity of the mill is stated in the report as at least 50 tons per day. The ore reserves with the dump are thus about two years ahead of the present milling. All this leads to the conviction that shareholders in Dolores Ltd. will be rewarded for their patience before very long by substantial dividends from the American company. This expectation is shared by the market, the price of Dolores Ltd. shares standing at £2½, with practically no sellers.

In connection with another sphere of mining industry, the Australian Smelting Corporation Ltd. has been formed in London this week with a capital of £350,000 in £1 shares of which 300,000 are offered to the public for subscription at par. Briefly stated, the company's sources of profit will be from (1) the Zinc Corporation Ltd. silver-lead concessions, (2) Broken Hill silver-lead concessions, (3) the Caledonia copper ores, (4) general smelting of other ores and concentrates, (5) the production of sulphuric acid, (6) the manufacture of fertilizers and other by-products. The managers are Messrs. Bewick, Moreing & Co., one of the firm—Mr. H. C. Hoover—being on the board. It is considered by those who are competent to judge that the Australian Smelting Corporation promises to be another Broken Hill success.

CALUMET, January 20, 1906.

Every indication points to the probability of the fire which broke out in No. 2 shaft of the Tamarack mine last week having been smothered. While a considerable quantity of gas still lingers in the workings, there is barely any discernible at the mouth of No. 2 shaft or No. 1, a short distance away. The fire started in an abandoned stope at the 22nd level. The timbering was very heavy at that point and as dry as tinder, furnishing a large amount of material for fire. As the draft would prevent the flames working downward, and there are no active workings above the point where the fire started, it is not thought that the blaze extended beyond the 22nd level workings. While this is the most serious fire ever experienced by the Tamarack, it is fortunate that the loss of life was not larger. Nearly 700 men were working in No. 1, 2 and 5 shafts when the fire started. The men were taken from the mile-deep workings in an incredibly short time, and the clear-headed heroism of not one but many officials and common miners is deserving of mention.

No. 2 shaft, in which the Tamarack fire started, is 4,400 ft. deep and the richest portion of the property. It was shipping upward of 1,000 tons of rock daily. Owing to the smoke and gases arising from the conflagration in No. 2 shaft, it became necessary to discontinue operations in No. 1 and 5 shafts. The former is not an important producer, shipping a few hundred tons of rock daily from the Osceola amygdaloid bed, which is reached by means of crosscuts. Originally the shaft secured its production from the Calumet conglomerate, for the purpose of opening which it was sunk, but the conglomerate was exhausted some time ago. No. 5 is one of the deepest and most important shafts of the Tamarack property, furnishing a large tonnage of rock of fairly good quality. As No. 3 and 4 shafts, known as the North Tamarack branch of the mine, are not connected with the company's other shafts, the fire had no effect on their operations. Work continued on the usual scale, No. 3 shaft furnishing 1,000 tons of rock daily and No. 4 a small quantity.

While scores of miners have lost their lives in the Lake Superior copper district through mine fires, not one of the number has been burned. Not a single one has even had his clothing scorched. In every case death has been caused by suffocation from noxious gases produced by the burning timbers. The amygdaloid mines have but little timbering underground, but in the conglomerate mines, such as the Calumet & Hecla and Tamarack, the treacherous hanging walls above the copper-bearing strata necessitate heavy expenditure for timbering in order to safeguard the lives of the miners. Amygdaloid mines, like the Isle Royale, Osceola and Quincy, have strong rock walls and use little timber, nevertheless, the loss of lives from fires in the amygdaloid mines has been greater than in the conglomerate properties.

In its operations on the Osceola bed the Calumet & Hecla is driving drift-stopes the full width of the vein and about 12 ft. high. This provides an adequate rock supply for the mills and furthermore furnishes a thorough test of the lode's copper-bearing values as the work progresses. In this manner an accurate estimate of the stoping possibilities of the remaining ground is made possible. The drift-stopes follow the lode in all its turnings and much dead-work is thus eliminated.

It is learned from well-informed people that Walter Fitch is likely to assume the management of the Keweenaw Copper Company's work in Keweenaw county. Mr. Fitch has had more than twenty years' experience in the iron mines of the Lake Superior region. He resigned from the superintendency of the Clairton Steel Company's interests in the Lake district, which includes the Champion iron mine in Michigan and important properties on the Minnesota ranges, to accept the general managership of the United States Mining Company. The latter company's properties in Utah and California make it one of the most important copper concerns in the country. Mr. Fitch resigned from the United States Company three months ago, owing to his freedom of action being restricted, and since that time has been acting as consulting engineer at Salt Lake for important private interests. The need of a man of Mr. Fitch's abilities at the head of the Keweenaw Copper Company is recognized, as the concern is likely to develop into an important copper producer.

This week marks the inauguration of active work on the Old Belt property in Ontonagon county, recently taken over by the Lake Copper Company. The shaft on the Knowlton lode will be unwatered. The showing in this shaft is reported to have been excellent when the property discontinued operations, much copper being in evidence in the bottom. There are a number of promising copper-bearing formations traversing the property and these will be investigated by means of the diamond drill.

P. O. Wells, superintendent of the Lake Superior Smelting Company's plant at Dollar Bay, has resigned to take a position with the International Ore Treating Company. Mr. Wells will be superintendent of the concern. John T. Morrow, formerly manager of the Greene Consolidated, is general manager.

According to present plans, the Victoria mine, in Ontonagon county, will start regular production in March. Work on the power plant has advanced sufficiently to warrant this statement. Air power will be used exclusively in the operation of the stamp-mill, hoisting machinery, power drills underground and various shops about the surface of the mine. As the cost of fuel will be eliminated, it is expected that the mine will show low operating costs. The Victoria mine is extensively developed, the management estimating the ore available for stoping being sufficient to supply the single head in the stamp-mill for five years.

President H. F. Fay of the Centennial and Allouez companies is in the Lake district inspecting the mines with which he is associated. Both the Centennial and Allouez are increasing their production steadily, each having the entire use of one head under the latest arrangements. Carroll Watson, copper expert, with Dane, Smith & Co., of Boston, is in the Lake district inspecting mines. J. Q. Bennett of Burham & Bennett, Boston, was here this week to look over the Tecumseh mine. Quincy A. Shaw of the Calumet & Hecla Mining Co. has returned to Boston after a brief visit.

Sinking in No. 6 shaft of the old Osceola branch of the Osceola Consolidated Co. is under way below the forty-third level. There is a large area of undeveloped ground tributary to this shaft on the south, and it is expected that important developments will result when the drifts reach that portion of the property. It is planned to install a compressor of large capacity at this shaft during the current year. No. 5 shaft, the only other active shaft at the old Osceola mine, is furnishing approximately 400 tons of rock daily, the copper returns being satisfactory. No sinking is being done in this shaft at present.

ALASKA.

J. A. Murphy, the president of the Latouche Island Copper Mining Co., has arrived at Valdez en route to Latouche island, with men and supplies to continue work on the property.

ARIZONA.

The Territorial Supreme Court on January 20 handed down its decision in the mandamus proceedings brought by Attorney-General Clark against the Board of Supervisors of Yavapai county *et al.*, known as the mine tax cases. This decision is a practical victory for the Territorial Board of Equalization, though the court points out the fact that the proper course was not pursued. Raises made are not to be effective for the year 1905. Certiorari case brought by the Copper Queen Mining Co. was decided adversely to the mining company. Appeals are to be taken to the Supreme Court of the United States. Believing that the assessment of patented mining properties as returned by the county assessors was too low, the Board of Equalization last summer ordered raising of the valuations to what it

thought right. As the different counties had made different valuations in order to arrive at an equitable higher assessment, the Board of Equalization made a different, but, as it believed, just raise in the different counties. That is, the raises were uniform, but started from different standards. Part of the counties stood the raise and collected the taxes accordingly. In other counties boards of supervisors refused to make the raises, and the Board of Equalization brought mandamus suits against them in the Supreme Court. At the same time the Copper Queen Co. of Bisbee brought certiorari proceedings against the Board of Equalization to compel it to show its authority for its action.

Cochise County.

A coke shortage threatens the hoped increase in copper production. No shutdown is likely to occur. Snowstorms in New Mexico are said to have delayed cars in transit.

The damage to the Tranquility shaft-house, Tombstone, through the fire of last week, amounted to $5,000. The flames were kept from entering the shaft. More sinking pumps are being installed in the Tombstone main shaft.——Last week another cave-in occurred in the Commonwealth mine at Pearce, filling up old workings, but not materially injuring the more modern drifts and stopes.

Superintendent B. M. Pattison, of the Shattuck-Arizona and Denn mines, has returned from his visit to Duluth and St. Paul. At meetings of the directors it was decided to put in a larger hoist at the Shattuck, widen the shaft and build a tramway. At the Denn mine the main shaft entered limestone at 840 ft. Sinking will go straight ahead to the 900 level, where a station will be cut. The 1,000 level will then be made, when another station will be cut.——At the annual meeting of the stockholders of the Cochise Development Co. in Bisbee, it was decided to continue the west drift from the 300-ft. level. Sinking will be carried on at the same time.

Gila County.

D. P. Fuller, superintendent of the Pinto Creek Mining & Smelting Co., will put in a concentrating plant of 100 tons capacity at the Yo Tambien mine, near Globe.—— The Inspiration Mining Co. has made arrangements with the Old Dominion Co. for the treatment of its ore. It is expected that ore shipments will commence Feb. 1. ——At the Starlight mine, south of San Carlos, Superintendent F. A. Weast is mining and shipping.——The Castle Dome Development Co. is working claims of the Old Dominion Co., near Globe, under direction of Richard Rosskilley. A shaft 4x8 ft. will be sunk to a depth of 1,000 ft.——The Montezuma Copper Mining Co. is working claims west of the Live Oak mines, near Globe, with Charles Maybush as superintendent.

Mohave County.

The stockholders of the Grand Gulch Mining Co. have given an option on their copper property in Mohave county, south of St. George, Utah, to W. J. Guthrie of Butte, Mont., representing Butte & Boston capital. The workings at the lowest point are 435 ft. deep, reached by a double-compartment shaft. A new station cut at the 400-ft. level is in ore. The development on the old Adams claim has been accomplished through a tunnel 3,000 ft. in length, with drifts.

The hoist on the Merrimac mine, at Chloride, is being put in commission and the mine will be unwatered.

Pima County.

The Helvetia Mining Co. is drifting on the 500-ft. level at Helvetia.

Pinal County.

Work on the Lake Superior & Arizona mine is suspended, pending the arrival of pumps to handle water, which has come in on the 300-ft. level of the winze being sunk at the junction of two tunnels previously run into the mountain. The company plans building a smelter near Florence, on the Gila river. So far, progress at the property has been handicapped by its inaccessibility, the distance to rail at the present time being 30 miles, Florence being the nearest point.

Yavapai County.

The Western Queen Mines Co., which owns claims near Poland, has started work.

After a short shut-down for repairs after a six months' run, the furnaces at the United Verde mine at Jerome have been blown in.——The Prudential Mining Co. intends to resume work on its claims five miles east of Dewey.

Bradrick & McKinnon have taken a lease on the slag dump at the old Val Verde smelter, and will break it up, sort it over and have the slag that carries copper values smelted at the Arizona Smelting Co.'s plant at Humboldt.

The main shaft at the Verde King mine, at Jerome, is to be sunk 200 ft. deeper.——Near Prescott, the Continental Consolidated Mining Co. has let the contract to crosscut the Golden Standby vein at the 80-ft. level.—— About 75 men are sinking shafts on different claims in the new Carrigan district. Redmond Toohey, who has taken a bond on six claims in the district that adjoins those of Carrigan, is preparing to do extensive development work.

T. S. Henderson & Co., of St. Louis, have purchased a controlling interest in the Great Belcher mine, near Providence. The machinery and other property at the mine has been sold and heavier machinery will be installed.——A hoist and air compressors will be installed at the Copper Hill mine at Copper Basin, near Prescott, by Manager Symonds.

The Tiger Mining Co. is projecting a narrow-gauge road from the Crown King depot to its property.——The Mount Union Consolidated Gold Mining Co. has begun building a tramway to connect the mill with the wagon road on the summit of the mountain. It will be 2,500 ft. long and will enable the teams between the property and the Poland railroad station to make two trips daily instead of one.——The Triangle Mines Co. at McCabe has struck ore in the bottom of a shaft 100 ft. deep.——R. C. Houston has struck shipping ore in the Olden mine, 12 miles from Kirkland.

J. S. Carmichael, superintendent of the Pine Mountain Mining Co. of Prescott, reports that the 10-stamp mill is running day and night. The main shaft is down 500 ft. When cold weather is over sinking will be resumed.——Wm. Theising reports that his mill at Turkey is running day and night. A cyanide plant is to be put in to work the tailing.

C. E. Finney, general manager of the Arizona Smelting Co. at Humboldt, states that the 400-ton concentrating plant at Humboldt will be ready to start March 7th. Contracts have been let for a lead smelter, and the company will begin buying lead ores.

CALIFORNIA.

Amador County.

Underground work has been resumed at the Zeila mine, near Jackson, after the hoist framework had been repaired. The full capacity of the 40-stamp mill has been started. There is ample water.——T. C. Mayon, F. M. Clark and W. D. Clark, owners of the Clark-Mayon gravel mine, near Oleta, have made application to the Debris Commission for permission to mine that claim by hydraulic process.

Contra Costa County.

The Point Lewis smelter is now running full blast, with a working force of 200 men.

The Southern Pacific Co. has closed a contract with the Guggenheim smelter people by which they are to ship their ores from Nevada and Mexico over the Southern Pacific line to Port Costa, from which point they will be loaded on vessels and taken to the refinery at Tacoma, Wash. For this purpose the company is to rebuild its coal bunkers in the Port Costa yards.

Humboldt County.

P. L. Young and associates, who are operating a mine between Virgin and the head of Eagle creek, are arranging to put in an electric plant on the creek below, and are negotiating for the construction of an aerial tramway.——John Hennessy, owner of the Hunter mine at Whiterock, has leased the Ridgeway 10-stamp mill and has constructed a tramway from the property to the mill.

Inyo County.

It is expected that the 10-stamp mill at the Montgomery mine of the Pleasant Canyon Mining Co., near Ballarat, will be finished by March 1. The 50-ton cyanide plant has been started on the tailing pile. W. P. McComas has charge.

Los Angeles County.

The Lowell & California Mining Co. has completed a water well at Palmdale. In the spring the company will instal a 400-h. p. electric plant. The present 10-stamp mill will be replaced with one of 70 stamps.

Nevada County.

The Ironclad mine, near Grass Valley, is being renovated preparatory to starting sinking and drifting.

Placer County.

The Al Gol mine, eight miles northeast of Lincoln, will be re-opened by John T. Cairns, of San Francisco, who has a bond on the property.

San Bernardino County.

The 5-stamp mill of John Carroll near Victorville has been completed and is in operation.——The stack on the dust chamber for the roasting furnace at the Arizona-Mexican Mining & Smelting Co.'s smelter at Needles is finished. The company has purchased over 2,000 tons of oré, which is bedded and ready for smelting. Dr. L. D. Godshall, general manager of the company, is at Needles.

James Tisnerat of Long Beach has bought of James Malony the Copper Glance copper claims No. 2 and 4, two miles north of Lane's Wells.

San Diego County.

Orders have been received at Julian to shut down the reduction works, the High Peak and the Helvia mines, pending advices from Los Angeles.

Sierra County.

(Special Correspondence).—The long wished for storms have arrived. There is from 15 to 20 ft. of snow on the summits, but the rain extended high enough to furnish plenty of water for the drift miners to wash their dumps that have been accumulating since last fall. The heavy storms have caused some delay with the drill that is prospecting on Mount Fillmore for gravel.——The Herkimer mine near Table Rock, under the management of H. R. Fowler, is making good progress with the tunnel and will be in gravel before spring. —— The White Bear, near Downieville, have begun to breast again.—— At the Hilo mine, near Downieville, they are washing their dump and taking out good pay dirt. —— Morse Bros. at Eureka have been drifting. The banks caved last week, covering up their blacksmith shop, timbers and tools. —— Wm. Brady has struck soft rock in his tunnel, near Downieville, and discontinued the use of his power drill. —— The Last Resort have their tunnel in 200 ft. and are now putting up an inclined raise for air. —— At the Telegraph mine they have their electric power plant in full operation and have started to sink on their ledge.——Humphrey & Myers of San Francisco have taken an option on the Twin Eagle at Gold Point and have put a crew to work. —— The Oaklick mine have discontinued operations. They have sufficient development done till they build their mill in the spring.——The Empire in Gold valley, which closed for a short while on account of shortage of water, has started again. —— The Mountain mine at Sierra City has temporarily suspended operations owing to an accident to the tramway. —— The Marguerite, near Sierra City, is running a drain tunnel. When this is completed they will resume sinking. —— Richard Phelan of Sierra City failed to get all the machinery for his electric plant in before the roads closed, which has retarded development.——The Sierra Buttes at Sierra City have resumed operations, having repaired the old 20-stamp mill and completed the new 40-stamp mill and tramway.——At the Sovereign tunnel, near Downieville, they intend to build a mill as soon as the weather will permit. —— George Morrison is preparing to open up the Primrose.

Downieville, Jan. 22.

Shasta County.

The Kette Mining Co., which owns the Clara mine, between Taylor and Keswick, has two shifts sinking the main shaft, which is down 75 feet.

Siskiyou County.

W. R. McDowell, one of the owners of the Mulloy claims on Tanner's Peak, near Sawyers Bar, is driving tunnels on the vein, blocking out ore, and he expects to put in a mill in the spring.

Tulare County.

S. W. Steffner, one of the operators of the Josephine mine, is at White River, superintending the installation of the new mill, which will be in operation the first of February.

Tuolumne County.

Lester Wiley, superintendent and general manager of the Big Creek Gold Mining Co., operating near Groveland, has let a contract to open up 30 miles of the old Rock River ditch, which will facilitate mining in and about Groveland.

E. M. Carr, of Tuolumne, has purchased the hoisting machinery and buildings on the Bown mine, near Tuttletown.

The Black Oak mine, at Soulsbyville, has been started up.——The App mine, at Quartz, has resumed operations.——Albert Baier, of Columbia, and W. G. Phipps are in San Francisco arranging to start the Columbia mine, in Experimental gulch.——Heath & Grim have put in Pelton wheels to run the mill, concentrators and compressor at the Mt. Lily mine, at Columbia.

Yuba County.

The American Smelting & Refining Co. has purchased the Dempsey copper mining properties near Smartsville, and will erect large smelter works there on the line of the California Midland Railway to be built from Grass Valley and Auburn to Marysville.

COLORADO.

(Special Correspondence).—It is reported the Phelps-Dodge company have purchased land in the southern part of the State and will develop the coal lands.——An appropriation of $2,500,000 is being asked for from the Government for a new Federal building for Denver.—— During the past week several sections of the State have suffered from snowslides, and some lives lost as a consequence. On account of the extreme warm weather, the slides are running much earlier than common. Some places all communication has been cut off from the mines in the outlying districts.——There is being some effort put forth among some of the mining men of the State to establish a mining bureau similar to the one now in existence in California, where mining men can obtain accurate and practical information regarding the mining industry.

Denver, Jan. 22.

Clear Creek County.

Lougee & Hill, who have a lease on the tunnel, or 10th level of the Lamartine mine, near Idaho Springs, have a good showing in the winze, which has been sunk 50 ft. below the tunnel level. An electric plunger pump and an electrically operated hoist are being put in, and drifts will be driven east and west from the winze.

The Charter-Raton mine, two miles from Empire, is to be worked under the direction of C. H. Morris. —— Ratholtz & Wing have a lease and bond on the McLyman group on Leavenworth mountain, near Georgetown, and have started to clean out and retimber the crosscut and drifts preparatory to working the property. —— The Dunkirk Mining & Leasing Co., of which James H. Crandell is the general manager, are pushing work on the old Dunkirk property at Silver Plume.

Estelle & Co. have a lease and bond on the Richmond group, owned by the Woodley brothers, on Griffith and Saxon mountains, near Georgetown.

Gilpin County.

The shaft on the Mineral Hill property, in Moon gulch, near Central City, has been unwatered and cleaned out to its depth of 200 ft. Sinking is to be resumed. W. H. Knowles, of Denver, is manager.

At the Pozo mine in Nevada gulch, near Central City, new flues have been put in the boiler and repairs made to the shaft-building. The water is out to the depth of 160 ft. and the shaft is to be sunk another lift of 50 ft. The main operations are being carried on in the 140-ft. level. To handle the water station a compound pump is being put in at the second level and a tank 6x7x18 ft., having a capacity of over 5,000 gal., is to be put in at the same point. A. M. Rucker is manager.——Sinking has been resumed at the Mackey-Burroughs mine on Quartz hill, near Central City, and the present lift of shaft will make it a total depth of 1,050 ft.——Manager J. C. Fleschhutz of the Pewabic Consolidated Gold Mines Co., operating the Pewabic and Iron mines in Russell district, near Central City, has ordered a five-drill air compressor and a 7x10 Blake crusher. The new machinery is to be put in at the Iron shaft. The shaft is to be sunk deeper. The present daily average is 50 tons, all of which is treated at the New York mill at Black Hawk. ——Glanville & Peeck are putting up a new shaft-building for the Fairfield mine, near Central City, which is the second erection during the past two months, the former one being destroyed by a wind-storm, and the one previous to that being destroyed by fire ——At the Sleepy Hollow mine in Gregory district, near Black Hawk, which is being operated under the management of J. F. Hopkins, the water has been lowered to below the seventh level. The intention is to continue the work of lowering the water to its total depth of over 800 ft. and then of sinking the shaft to the 1,000-ft. point, but for the present developments will be confined to the seventh and upper levels, owing to the heavy expenses of taking out the water during the cold weather.——At the Gaston mine on Bates hill, near Central City, under a lease from the Arrighi estate, they have sunk the shaft to a depth of 210 ft., working

at a depth of 115 ft. They have shipped ore to the Buell mill. They are using a whim for hoisting, but may put in a steam hoisting plant.——Two shifts are running at the Buell mill in Mountain City on account of the increased supply of ores from custom mines.

Gunnison County.

Hendricks & Memson, leasers on the Cortland mine in McIntyre gulch, near Gunnison, have broken into rich ore on the 150-ft. level south.——The Grand Prize group in the Gold Brick district, above Ohio City, is showing rich ore.

Lake County.

Bardwell & Smith are opening up a large body of gray copper ore in the Emerald Isle group, on the Lake Fork river, near Lake City. A level has been started west from the bottom of the 160-ft. shaft.

Ouray County.

Wahl & Hupps have sold out their interest in the Neodesea lease, near Ouray, to Arps Bros., who will continue operations with an increased force. The present shaft will be sunk 100 ft. deeper and drifts run to open up stoping ground. The property adjoins the Wedge holdings, in the Bachelor district.

San Juan County.

Five Italian miners employed at the Sunnyside mine lost their lives in an immense snowslide on Jan. 22. —— No trains from Durango or Denver have arrived at Silverton since Jan. 17, due to slides and immense drifts of snow which have blocked the tracks. All the short line roads running to outlying camps are snowed in. There are 11 slides between Silverton and Elk Park. The slides average from 7 to 30 ft. deep and from 50 to 450 feet wide. One immense slide went into the Animas river, forming a dam of snow and ice, which caused the stream to back up and overflow the Rio Grande tracks to a depth of four feet. The Iowa mill, in Arrastra gulch, has been crushed in by heavy snowslides which came down Little Giant mountain.

San Miguel County.

A strike of rich mineral is reported on the property of the Black Bear Mining Co. in Ingram basin, five miles southeast of Telluride. In the spring the mine will be equipped with a mill, tramway, air compressor and hoist and thereafter worked on an extensive scale.——Improvements are being made on the rag plant at the Liberty Bell mill, one-half mile above Telluride. When the new process for the treatment of the ore was adopted in the mill about a year ago and which has since been utilized it was thought the recovery of values would be so close there would be no further use for the rag plant. The Liberty Bell mill contains 80 stamps and tube-mills and has been crushing 300 tons of ore daily. The value is saved by amalgamation and concentration.

Summit County.

(Special Correspondence).—Another strike has been made in the Old Union mine, near Breckenridge. Upraises have been started above the large main tunnel to start stoping ore for the mill.——The Excelsior mine at Frisco, owned by Frank Wyborg of Cincinnati, Ohio, is making shipments of high-grade silver ore.——The Germania mine, on Little Mountain, continues to make regular shipments of silver ore from the lease operated by Engle & Kaiser.——The Sallie Barber mine, on Nigger Hill, Breckenridge, has a large quantity of zinc-lead ore awaiting shipment, but the management cannot obtain cars from the railroad.——The Jessie mine has been again leased to Thomas R. Griffith of Breckenridge.——The Lenawa Reduction & Tunnel Co. has been incorporated by James H. Myers, to operate the Lenawa property in Montezuma.

Breckenridge, Jan. 22.

The Number Three shaft on the Silver King property on Nigger hill, near Breckenridge, is being operated under a sub-lease by D. W. Dean and W. Sprague.

Teller County.

(Special Correspondence).—The Elkton mine is making its usual production from main workings and leases. The Gregory lease on the Elkton is producing 3,000 tons per month. The Tornado lease is making a fair production of 2½ to 3 oz. ore. The main workings of the Elkton are producing 1,800 tons per month. Some benefit is still being derived from the old El Paso drainage tunnel, and according to R. P. Windsor, superintendent, the water is receding about .6 ft. per week. E. M. DeLavergene, of Elkton, Colo., is manager.——Generally speaking, the mines of the Cripple Creek district are keeping up the usual output, and in some instances increasing. There is complaint throughout the district that the miners are not spending their money at home, but sending away for their supplies, and that the adjoining towns are not in a prosperous condition.——The prospects of the new drainage tunnel do not look encouraging at present, as some of the mines in the district are said to be blocking the scheme.——On Beach hill the El Paso mine, W. M. Bainbridge superintendent, is putting in a big pump. Work will commence immediately at the bottom level and ore taken out as rapidly as possible. It is thought that the pumping at the El Paso will help out the C. K. & N., which adjoins the El Paso, and which has been closed down for some time on account of the volume of water they have to contend with at the lower levels.

Cripple Creek, Jan. 20.

On Beacon hill, near Cripple Creek, the Rocky Mountain and Old Gold, after a few months of idleness, have resumed operations.——Funk, Morrison & Co., operating a lease on the Silver Tip claim of the United Gold Mines Co. on Bull hill, have completed sinking the shaft and have started north and south to drift on the vein.——A mill is to be erected by the Little Giant Mining & Milling Co. on the site of one destroyed by fire recently. Charles B. Burch is manager.——The south end of the Dexter property, at the southwest extremity of Bull hill, is being prospected by lessees.

The Lou Dillon, being operated under lease by the Dillon Leasing Co., of which John Price is president and general manager, is producing 700 tons a month. Another 100-ft. lift is being added to the shaft, which will give it a depth of 900 ft., at which point a station will be cut and drifting started.

IDAHO.

Blaine County.

The Idaho Prospecting & Development Co., Ltd., has been incorporated at Hailey, with Samuel Friend as president, to work the Merchant and Dundee gold properties.

Kootenai County.

The Gold Ridge Mining Co. at Cœur d'Alene at its annual meeting elected F. L. Bergan president and Daniel Davis manager. The property consists of four quartz claims, a water right and a millsite, six miles from St. Joe, at the head of navigation on the St. Joe river. Four men are sinking a double-compartment shaft, now down 70 ft. This shaft will be sunk 200 ft. and then crosscut the ledge. As soon as the snow will permit they will build six miles of wagon road and put in hoisting machinery.

Latah County.

On Moscow mountain, eight miles northeast of Moscow, the White Cross Mining & Milling Co. is working a double shift, driving a tunnel that when completed will cut the ledge 400 ft. below the surface. This lower tunnel is in 270 ft. It is estimated that 30 ft. more will cut the ledge. Within two months experts have recommended that the company no longer use the stamp-mill, but put in the cyanide process. Before doing this, however, the company decided to run a tunnel that would give them such depths as would give assurance that the rich ores go down. F. H. Schriber is president.

MONTANA.

Beaverhead County.

The Montana-Ajax Co., owner of the Ajax mine near Briston, will connect the mine with its 40-stamp mill by an aerial tramway in the spring. The management is drifting from the lower tunnel to test the value of the vein.

Deer Lodge County.

Proceedings have been begun against the Anaconda Mining Co. and Washoe Co. of the Amalgamated Copper Co., operating the Washoe copper smelter at Anaconda, seeking an injunction perpetually restraining the smelter from operation on the grounds that poisonous elements are evolved from the smelter through the smoke settling upon farms in the vicinity, rendering what was once a fertile stretch of country now a waste. Fred J. Bliss of Idaho, who brings the suit, represents the so-called 'smoke association,' composed of a number of ranchers in Deer Lodge valley, adjacent to the plants of the Amalgamated Co. It is alleged that $2,000,000 worth of agricultural land has been rendered unproductive through precipitation from smelter fumes. Damages are also asked for stock said to have been killed through the eating of grass upon which fine copper had been precipitated.

Madison County.

The Toledo Mining Co., which succeeded the Bismarck-Nugget Gulch Co., is prospecting its claims, near Sheridan, with a diamond drill.

The Conroy Placer Mining Co. has made a contract with the Madison River Power Co. for electric power for its new dredge.

Powell County.

Boiler and hoist have been put on the Lady Smith copper mine, 10 miles north of Elliston, and sinking of the main working shaft has been started. Vincent Smith has charge.——W. M. Price is getting out high-grade ore from his property near the Lady Smith, and Frank Wilton is developing property at the head of Deadwood gulch. The ore produced is free milling and a stamp-mill may be erected during this year.——C. F. Fredericks, who purchased the Monarch mine, near Elliston, has let a contract to Charles Anderson to run a 200-ft. tunnel drift on the Monarch vein.

Silver Bow County.

(Special Correspondence).—In 1905 Montana produced 350,000,000 lb. of copper, and of that amount the Butte district contributed 341,751,065 lb. The Butte output by months was as follows: January, 29,419,000 lb.; February, 26,089,000; March, 28,977,250; April, 26,850,000; May, 28,220,000; June, 31,290,000; July, 27,079,000; August, 28,356,940; September, 26,970,000; October, 28,517,520; November, 29,817,650; December, 30,164,705. Butte ores carry an average of 2½c. in gold and silver for each pound of copper, which added nearly $9,000,000 to the copper value, or a total value of the mineral output of the Butte district of $63,680,170.40, taking 16c. as the average for copper. The December output was as follows:

Company.	Pounds of Copper.	Tons of Ore.	Yield Per Ton in Pounds.
Boston & Montana	7,015,300	96,100	73
Anaconda	8,184,000	127,875	64
Butte & Boston	1,033,090	16,430	63
Trenton	1,153,200	18,600	62

The Butte & London Copper Mining Co., with a capital stock of $5,000,000, has been organized in Butte and incorporated under the laws of Arizona. The officers are: President, Theodore Brantly; vice-president, James H. Lynch; treasurer, Alexander J. Johnston. The company owns the Greendale placer claim, consisting of 113 acres, and lying 1,000 ft. east of the North Butte properties. Mining engineers have reported that the North Butte veins go through the Greendale. Adjoining the Greendale on the east is the Greenleaf of the Boston & Montana Co., upon which the latter is working and has cut a vein at a depth of 150 ft. —— The East Butte Mining Co. has taken the leasers out of the Yankee Boy and Dutton mines and extensive repairs are being made in both. The Dutton shaft will be made the main working shaft of the East Butte and will be sunk to a depth of 1,000 ft. Leasers will continue working the other mines of the company until the property is fully equipped with larger machinery for extensive operations. —— The Raven Mining Co. has begun shipping ore and is also running another crosscut to the veins from the 1,500-ft. station, expecting to cut the main vein in a month.

Butte, Jan. 22.

Development work at the Combination mine in Meaderville, owned and operated by the Reins Copper Co., is progressing rapidly. The shaft is down to the depth of 1,030 ft. At the 1,000-ft. level excavation was made for a pump station and a large pump has been installed, which handles all of the water in the mine. Another large pump on the 800 level is ready to use, but is held in reserve. It is the intention of the company to continue development work until the 1,200 level is reached, when a working station will be made and a crosscut run to the lead, which was found a short distance from the shaft by crosscutting on the 800 level.

NEVADA.

The tariff on ore to given points on the line of the Southern Pacific railroad is stated by the Nevada *State Journal* to be as follows: From Mound House to Keeler and points between, ore which does not exceed in value $25 per ton, the rate is $4.50 per ton; not exceeding $50 per ton, $6 charge; not exceeding $100 per ton, $10 charge. From Palisade to Keswick, San Francisco or Vallejo, not exceeding $50 per ton, $5.80; not exceeding $100 per ton, $7.80. From Battle Mountain to Keswick, San Francisco or Vallejo, not exceeding $50 per ton, $5.40; not exceeding $100 per ton, $7.20. From Sodaville to Utah smelters, not over $40 per ton, $5; over $50 per ton, $6.75; not over $60 per ton, $7; not over $70 per ton, $8; not over $80 per ton, $9; not over $90 per ton, $10; not over $100 per ton, $11.20. From Sodaville to Denver, not over $40 per ton, $8; not over $50 per ton, $9.75; not over $60 per ton, $10; not over $70 per ton, $11; not over $80 per ton, $12; not over $90 per ton, $13; not over $100 per ton, $14.20. From Eureka to Utah smelters, not over $12 per ton, $5; not over $37.25 per ton, $6.25; not over $59.49 per ton, $8.25; not over $112.12 per ton, $10.75. From Austin to Utah smelters, under $50 per ton, $7.50; under $50 per ton, $8.50; not over $100 per ton, $9.95.

Esmeralda County.

The Manhattan Dexter Mining Co. will erect a 20-stamp custom mill and cyanide plant at Manhattan. The mill has been purchased by A. D. Nash. Only 10 stamps will be put in at present.

Abner J. McDaniel, manager for the Gold Mountain Exploration Syndicate, will put in a mill on the syndicate's property at Gold Mountain.——J. H. Humphrey, of the Nevada-Goldfield property on Gold mountain, reports that the main working double-compartment shaft is down 100 ft., but crosscutting will not be commenced until the 300-ft. level has been reached. The hoist is of sufficient capacity for 800 ft.——The Flying Dutchman mine, near Aurora, has been sold by Al Wild to Eastern parties for $60,000. The new owners will build a large hoist and make improvements. —— Lumber and other materials are being hauled to the Diamondfield-Triangle property at Diamondfield and a new 12-h.p. gasoline hoist will be put in place.

Lincoln County.

(Special Correspondence).— President Hansen states that the Searchlight & Northern will push the construction of their new railroad through Searchlight on to Eldorado canyon, regardless of what the Santa Fe intends to do. The Searchlight & Northern will be a narrow gauge, connecting with the Los Angeles, San Pedro & Salt Lake Railroad at Nipton. The Santa Fe, which has its surveying party in the field, will make its connection at Golfs, on the main line, and will build a broad-gauge road, thus giving Searchlight two railroads by next July.——The Pompeii Mining Co. has installed its large pump, which will handle 60,000 gallons of water per day. This company will furnish the Searchlight & Northern Railroad with 40,000 gallons of water per day. ——The Searchlight Consolidated has completed the construction of the buildings it requires, and has started a large force to work. This company has some excellent ore at the grass roots and the development of their ground with a 500-ft. shaft will be watched with interest.——A quarter of a million dollar deal was made when McGhan & McLaughlin sold their claims to Geo. P. Spittall and Philadelphia associates and Los Angeles capitalists.——A rich strike was lately made on the Cyrus Noble mine. The mill on this property will soon be completed.——The Goodenough mine has a new hoist on the ground, and will develop the rich ledge of free gold at their 100-ft. level. This ledge is the west extension of the Duplex mine, and the east extension of the Cyrus Noble mine.——The Quartette mine is nearing the 1,000-ft. level. Two upraises were driven from the eighth level, both being in rich ore. This company has brought most of its 20-stamp mill from the river, and will soon have forty stamps in operation at the mine.——The Santa Fe mine will start sinking for the 500-ft. level. A 25-h. p. hoist and a 40,000-gal. Cornish pump have been installed recently, as well as a 1000-lb. skip, and active operations will now go forward. ——Within three weeks stamps will be falling in the new 10-stamp mill of the Searchlight Mining & Milling Co. There are nearly 2,000 tons of broken ore now ready to go into the hoppers, as soon as the mill is ready for operation. This mine has been shut down for a short time, on account of inability to economically handle the ore already broken, but work will now be resumed in the mine at once.——The Black Hawk mine, owned by the LeRoy Mining & Milling Co., has had a gallows frame erected in the record-breaking time of three days. It is equipped with a 15-h. p. hoist. The shaft is down 250 ft., and active operations are going steadily forward.

Searchlight, Jan. 20.

Geo. E. Otis and associates, owning the Gladiator

group at Eldorado Canyon. will prospect by diamond drilling.——Geo. W. Seay, of Searchlight, has sold out his interest in the Harris turquoise mines at Crescent to Wm. F. Fonda and Peploe Forwood, of San Francisco. It is stated that the owners will run a long tunnel to open the lead at great depth, to facilitate which an air-compressor plant and machine drills will be put in.

The Duplex and Good Hope claims at Searchlight have been sold to George Brockman and associates.

A working shaft is to be sunk on the Sibert ledge, near Caliente, to connect with the tunnel being driven with three shifts. It is reported that C. B. Sibert intends to put up a 50-stamp mill.——Duncan & Burke, of Pueblo, Colo., have purchased a half interest in the Snowslide claims, northwest of Caliente, and will sink a double-compartment shaft on the Black Bird, on a ledge of high-grade silver-lead ore.

The Hidden Treasure gold mines on Virgin river, south of Caliente, have been sold to W. T. Miles, of Chicago, who intends to put in a mill and develop the property.——Bismuth is reported to have been struck three miles from Caliente.

Nye County.

The Nevada Copper Co. has been organized to operate the Dunlap copper mine in the Pilot range, 18 miles northeast of Sodaville and 65 miles north of Tonopah. The Tonopah Mining Co. is said to have the control. A new tunnel will be driven 2,800 ft. to tap the sulphide ore zone, 400 ft. deeper than the present workings. A concentrating mill of a daily capacity of 100 tons will be installed immediately and the concentrates shipped to Salt Lake smelters.

A diamond drilling plant has been ordered from Chicago by the Anchor Gold Mining Co., of which E. R. Argersinger, of Tonopah, is the local manager. It is intended to use the drill on the company's Silver Pick lease, as well as on several other leases in which it is interested.

NEW MEXICO.

Colfax County.

Power drills are being installed by the Gold & Copper Deep Tunnel Mining & Milling Co., at Baldy, where 1,800 ft. of development work has already been done.

Dona Ana County.

The Dona Ana Mining Co. is putting in a 150-ton concentrator at its mine, near Organ.——The Stephenson-Bennett property has passed into the control of Missouri capitalists, who are sinking a double-compartment shaft to a depth of 500 ft.——The Modoc Mining Co. has placed an order for a new mill, the former dry concentrating plant having proved unsuccessful.

Grant County.

A pump has been ordered for the Cobra Negra mine, near Lordsburg. The North American Co., owner of the mine, will continue sinking on the main shaft. F. A. Lister is at the mine.——The Burro Mountain Copper Co. has acquired the Irish Gray group, the Stella, the Nighthawk and the I. C. claims at Leopold.——A. W. Humpe and associates of Grand Rapids, Mich., have leased from the International Gold Mining & Milling Co. the Gold Brick claims in the Malone district. They will complete the mill now under construction.

Sierra County.

The Sierra Consolidated Gold Mining Co., which owns the Snake mine, east of Hillsboro, is behind a project to build a trolley line from Deming to Hillsboro.

OREGON.

Grant County.

The Steuben Placer Mining Co., which recently acquired the Thornburg placers on the North Fork, has installed an electric lighting plant and is preparing to operate the mines next season.

R. C. Reese, superintendent of the Dixie Meadows mine, near Prairie City, will leave for Denver shortly to purchase machinery which the management has decided to instal. This will be placed by February 15, if possible. The work of sinking 3,000 ft. will require about four months, after which time a new stamp mill will be put in. A new sinking plant and air compressors are now being installed.

Jackson County.

It is reported that the Blue Ledge copper mine on Elliott creek, in the Siskiyou range, on the California-Oregon line, has been sold to Robert S. Towne, of New York. F. W. Carnahan has been appointed superintendent. The new owners may build a railroad 30 miles long to Medford.

SOUTH DAKOTA.

Lawrence County.

The Clover Leaf Mining Co. is preparing to drain the mine and resume operations. The company owns 57 claims at Roubaix and has a 60-stamp mill. Since the flooding of the mine last June the property has been idle, but the average flow of surface and other water into the mine is about 620 gal. per minute. The pumps can handle this as soon as the mine is drained out, as the flooding resulted from an accident. The company will also sink a new shaft, which it will connect with the old one by means of a tunnel.——Edward Major of Central City has taken a lease on the Esmeralda property and also on the Columbus mill, at the mouth of Blacktail gulch.

Chas. A. Allen, manager of the Lucky Star Co., operating on Box Elder creek, south of the Clover Leaf, reports the shaft 100 ft. deep and crosscutting under way. Work is to be continued through the winter.

Pennington County.

All the machinery for the new Clara Belle mill, near Hill City, has arrived and is expected to be placed by March 1. The shaft is down 250 ft.——Ten men are employed at the Gertie mine at Hill City in repairing and preparing the mill for a test run. A 1-stamp mill is to be used on the preliminary tests.

UTAH.

Iron County.

James Canfield of the Bull Valley iron mines states that work has been discontinued at the mines for the present, owing to the weather.

Juab County.

Supt. C. W. Jones, of the Bonanza mine in West Tintic, near Eureka, states that he is trying to induce the company to put up a mill for the treatment of the low-grade ores of that region.——At a meeting of the board of directors of the Sweetwater Mining Co. it was decided to continue the work on the North Tintic property indefinitely. A shafthouse has been erected, a whim put in, and a wagon road is being built to the claims.——The Scranton mine in West Tintic will soon be shipping a carload of ore a day. The ore-house on the San Pedro railroad is finished.——The output from the mines of Tintic has increased so rapidly in the past few weeks that the Rio Grande Western railway has found it necessary to put on an extra switch engine and crew to handle the ore cars. The present output of the mines has never been equalled in their history.——The ore shipments from Eureka for the week ending January 20 amounted to 167 carloads, produced by the following properties: Scranton, 1; Ridge & Valley, 5; Centennial-Eureka, 51; Bullion-Beck, 7; Dragon Iron mine, 18; Gemini, 17; May Day, 1; Yankee Consolidated, 4; Beck Tunnel, 2; Eureka Hill (lease), 3; Brooklyn Consolidated, 1; Swansea, 4; South Swansea, 1; Eagle & Blue Bell, 5; Uncle Sam Consolidated, 2; Ajax, 4; Black Jack, 7; Carisa, 6; Grand Central, 10; Lower Mammoth, 1; Victoria, 5; Victor, 1.

Piute County.

The Annie Laurie Mining Co.'s mill, at Kimberly, has been closed down and it will not be in operation again until March 1. The crushing, rolling, firing and cyanide departments are to be overhauled. G. A. Baird has been elected president of the company.

Summit County.

A 500-ton ore-bin has been completed at the Little Bell mine at Park City, and Superintendent Newton Dunyon intends to begin shipping ore soon.

Washington County.

S. L. Adams and associates have sold a controlling interest in the Paymaster copper mine, near St. George, to Samuel Newhouse, Joseph T. Jenkins and F. A. Schirmer. Mr. Adams still retains a third interest and will be placed in charge. It is the intention of the new management to sink the shaft deeper.

WASHINGTON.

Ferry County.

The Oversight Mining & Milling Co., operating 10 claims on Belcher mountain, near Republic, has built an engine house and a four-drill compressor plant. A tunnel is being driven along the foot-wall of the Oversight vein. Manager E. J. Delbridge is arranging to ship ore to the Granby smelter.

The Pearl Consolidated Mining Co. of Republic has purchased the air compressor and water drills formerly at the Princess Maud tunnel. William M. Crummer is superintendent and is pushing work at the Lone Pine.——A crosscut from the tunnel on the 300-ft. level of the Copper Key mine near Republic is being pushed ahead to tap another vein.

Okanogan County.

(Special Correspondence).—At the Triune mine, at Golden, the lower tunnel has crossed the third vein. It is two feet wide and produces some of the best ore that has ever been found in the mine.——At the Copper World Extension mine, the south crosscut on the 200-ft. level had cut a wide vein of iron sulphide which gives good value in copper.——Work is to be started on the Bodie mine, at Bodie camp, under the new management. A contract has been let to drive 100 ft. on the vein on the 300-ft. level. The Bodie mine lies near the Ferry county west line and is tributary to Republic.——The Phil Sheridan mine, at Sheridan, is being worked by the Phil Sheridan Mining & Milling Co., of which William A. Potter of New York and Peoria, Ill., is president. The mines are 14 miles northwest of Republic, near the head of Toroda creek. The nearest railway station is Lynch's, on the Victoria, Vancouver & Eastern line, over which the ore may be shipped to the British Columbia or coast smelters. The Phil Sheridan vein has been opened by a shaft 100 ft. on the dip of the vein. A tunnel 220 ft. long crosses it at that depth. The high-grade ore is being shipped and the low grade will be held for concentration. The company has located a water right and millsite on the east branch of Toroda creek. The ore can be hauled and transported by wagon and railway to the smelter and treated, at a cost of $12.50 per ton.——High-grade silver ore has been found on the lower tunnel level of the Ruby mine, at Nighthawk, 300 ft. lower than the No. 2 tunnel workings.

Republic, Jan. 19.

The Judge Mining Co. has acquired the Leadville group on Palmer mountain, four miles from Loomis. O. W. Irwin, of Dayton, Ohio, is president.

The Prize mine, on Mount Elemeham, near Nighthawk, has been sending out small lots of shipping ore to the smelters.

Pierce County.

From the plant of the Tacoma Smelting Co. a carload of copper-wire bars is being shipped each day to the Atlantic coast, to be loaded on steamers bound for Germany, where the bars are drawn into wire. The smelter has, for the present, discontinued the moulding of the small copper ingots. The addition to the refinery is under cover and the new reverberatory furnace is being installed.

FOREIGN.

AFRICA.

Rand.

A scheme is under consideration at Johannesburg for the installation of an electric generating station at Vereeniging, capable of developing 100,000 h. p., for supplying the needs of the Witwatersrand. Vereeniging is 32 miles from the Rand, and it is intended to utilize coal-fields in the Vereeniging district, where a plentiful supply of water is also available.

CANADA.

BRITISH COLUMBIA.

Boundary District.

The output of the Boundary mines for the week ended Jan. 20 was: Granby mines to Granby smelter, 16,708 tons; Mother Lode to B. C. Copper smelter, 3,424; Brooklyn Stemwinder to Dominion Copper smelter, 2,790; Rawhide to Dominion Copper smelter, 420; Sunset to Dominion Copper smelter, 1,716; Emma to Nelson and B. C. Copper smelters, 363; Oro Denoro to Granby smelter, 510; Providence to Trail smelter, 40. Total shipments for week, 25,971 tons; total for year, 54,476 tons. Boundary smelters treated as follows: Granby smelter, 17,020 tons; B. C. Copper Co. smelter, 3,653; Dominion Copper Co. smelter, 4,297. Total for week, 26,000 tons; total for year to date, 58,172 tons.

Cariboo District.

The Bear Hydraulic Mining Co. is getting out lumber for a bedrock flume. The mine is on the south side of Cunningham creek.——At La Fontaine, on Lightning creek, the Cariboo Consolidated, Ltd., has been drifting to bedrock in the channel of the creek. It took two years to complete the company's plant, and is said to be handling ground that runs five ounces in gold to the set of timbers, each set being four feet wide and four feet long.——The Cariboo Goldfields Co., Ltd., has resumed operations after being shut down several months. This company is on Williams creek. F. C. Laird has charge. In this territory, in the Barkerville neighborhood, 150 white men and from 300 to 400 Chinamen are working. Ten companies are in the field.

East Kootenay District.

D. C. Corbin of Spokane and his associates have purchased 17 square miles of coal lands in the Crow's Nest district, 18 miles east of Fernie. The property was bought from Al Page of Wardner, Idaho, and the Langley Bros. of Cranbrook, B. C. Development has exposed a vein 80 ft. in thickness. This has been stripped on the surface for 1,200 feet.

Rossland District.

All of the details having been completed for the amalgamation of the Center Star and War Eagle companies at Rossland, the two are welded into one corporation, the Center Star purchasing the assets of the War Eagle. The ground of the two companies, together with their machinery, will hereafter be operated by the Center Star Consolidated Mining Co.——Work has been resumed at the Mabel, near Rossland. —— The ore shipments for the week ended Jan. 20 were: Center Star, 4,080 tons; Le Roi No. 1, 2,040; Le Roi No. 2, 570; Jumbo, 300. Total, 6,990 tons, and for the year, 19,210 tons.

Slocan District.

W. E. Zwickey, of Kaslo, manager of the Rambler-Cariboo mines, in McGuigan basin, reports that the crosscut tunnels being run to the vein at the 1,400-ft. level has been run 3,700 ft. of the estimated 4,500 ft. before a raise is to be made with the shaft. This tunnel will lessen the cost of pumping and hoisting. The portal is on Dardanelles creek, half way between McGuigan station and the mine. It was started on July 9, 1904.

KOREA.

The report by the Commercial Bureau of the Japanese Foreign Office on Mines and Mining in Korea shows that the mineral output of Korea consists entirely of gold, which is recovered by placer or quartz mining. The number of places where gold is at present worked, either by placer or quartz mining methods, amounts to 120. The amount produced annually is about 121,000 oz., of a value of $2,250,000. Quartz gold appears most plentiful in Pyeng-An province, the Wonsan mine being the most valuable in the country. The next in importance is the Eun-san mine. Other valuable mines are Chang-song and Tel-chon. Placer gold occupies the principal place in the products of the peninsula, and the mining districts are more widely distributed than those of the quartz mines. Of the total gold output, the proportion of placer gold amounts to $1,500,000. The principal centers of placer mining are situated in Pyeng-An province, the whole annual output of this province being 48,000 oz., of a value of $750,000. In spite of the demand for silver in Korea there is no native supply. There are, however, silver mines in the country. Experimental workings have been made, and it appears that there are undoubtedly silver deposits. Owing to the expense of working, however, they offer far more difficulty in working profitably than gold mines, and especially than placer gold. Copper occurs chiefly in the north and south of the peninsula, and is rarely found in the central districts. The principal mine in the country is that of Kap-san, in Ham-Gyeng province, which has a considerable output, amounting to 270,000 lb. of refined copper per annum. Iron is found in Whang-Hai and other provinces, but the difficulty and expense of mining and smelting have hitherto precluded the Koreans from engaging to any great extent in this industry. The future of the coal mining industry in Korea does not look promising; there are, however, coal deposits in several places. Of these deposits only that at Pyeng-Yang consists of smokeless coal, all the others being bituminous, and though some of the deposits are of considerable extent, the quality is not very good. Crystal is a famous product of Korea. It is found principally in Kyeng-ju, in North Kyeng-Sang province, and is of excellent quality. Talc of excellent quality is found at Pyeng-hai, in Kang-Won province, and in the neighborhood of Yee-Chun, in Kyeng-Kei province, but it does not appear ever to have been worked.

MEXICO.

Chihuahua.

The dismantling of the San Felipe smelter on the north side of the Chuviscar river has been started. The material of this plant is to be utilized in the new Chihuahua plant as far as possible. W. W. Morse is in charge of construction work at the new smelter.

At the Los Angeles gold mines, 75 miles southwest of Sandia, the foundations for the new 10-stamp mill are nearly completed.

Coahuila.

The Continental Mining Co. has obtained a concession from the Legislature to establish smelting works near Monclova.

Durango.

Alexander Baring and associates have purchased the Guadalupe mine, near Inde, and will put in a 100-ton mill and cyanide plant, also a five-mile pipe-line. F. P. Sherwood made the deal.

The Mexico Consolidated Mining & Smelting Co. at Guanacevi has started stoping. Hitherto the company has been using only such ores as came from development work. The mill continues to run smoothly.

Construction work is to be commenced by the Parral Power & Reduction Co., which has taken over the concessions held by Eugene Davis of Washington upon a 5,005-h.p. electric plant in the State of Durango, 51 miles from Parral, which will furnish electric power to Parral, Santa Barbara, Inde and Guanacevi, and for a 1,100-ton reduction plant at Parral.

Mexico.

The efficiency of the 100-stamp mill and the cyanide plant recently installed at El Oro, on the mining property of the El Oro Mining & Railway Co., is said to have exceeded the original estimates and the new plant alone is handling the entire output of 15,000 tons a month, without using the old 100-stamp mill.

Sinaloa.

The Compania Minera Guadalupe de los Reyes, which owns six mines in the Cosala district, is preparing to reduce the cost of operating its mines and reduction works by installing a hydro-electric plant at the falls of the Piaxtla river. The plant will have a capacity of 5,000 h.p. Robert McF. Doble recently prepared plans for this plant.

The Oro Fino Mining Co., which recently acquired an old mine in the Rosario district, has started to develop the property by means of a tunnel. An air compressor and rock-drills have been put in and the plans of the company include a 10-stamp mill. At present the mine is reached by a mule-back trip of 30 miles from Rosario. The Guaymas-Guadalajara extension of the Southern Pacific will pass within eight miles. J. W. A. Off, C. F. Whittier, Isaac Bryson and C. Butterfield, of Los Angeles, are interested.

Sonora.

The Monte Visto Mining Co., operating near Cos, is to put a 20-stamp mill on the property, with extra power, so that other stamps may be added.

The Trinity Mining Co., which bought from M. Latz the Jojuba mine, nine miles west of Magdalena, is to add a cyanide plant to the mill.

The Giroux Consolidated Mining Co. are receiving machinery to put up a reduction plant at Capote, for reduction of low-grade ore from their Sultana property.

Books Received.

'Geology of the Boulder District, Colorad o,' by N. M Fenneman, Bulletin No. 265 of the United States Geological Survey. The greater part is taken up with a discussion of the physiography and stratigraphy of the region. Under the head of economic geology, oil and gas occurrence in the Pierre sandstone is described in detail.

'Report of the Bureau of Mines of Ontario, 1905.' Part I comprises a statistical review for 1904, an account of summer mining classes, mines of Ontario, petroleum and natural gas, cement industry, explorations in Arbitibi, Loon Lake iron-bearing district, Boston township iron range, pre-Cambrian nomenclature and the iron ranges of Michipicoten West.

The United States Geological Survey has issued two folios dealing with the geology of the Black Hills and of the Great Plains province, Sundance No. 127 and Aladdin No. 128. The former comprises the southeast corner of Crook county, and the northeast corner of Weston county, Wyoming, and also a narrow area of Pennington and Lawrence counties, South Dakota. The latter comprises the northeast corner of Crook county, Wyoming, a narrow strip of Butte county, South Dakota, and the extreme northwest corner of Lawrence county, South Dakota, on the east, and a little of Custer county, Montana, on the west.

Commercial Paragraphs.

H. C. LEE, Los Angeles, manager for Harron, Rickard & McCone, was in San Francisco this week.

THE Pelton Water Wheel Co. have sold their present plant and will build larger and better equipped works at 19th & Harrison Sts., San Francisco.

THE Robins Conveying Belt Co. has recently opened an office in the Frick Bdg., Pittsburg, Pa., with G. R. Delamater as resident engineer, who is prepared to receive inquiries relating to conveying and hoisting machinery.

THE Sullivan Machinery Co., of Chicago, reports the appointment of H. T. Walsh, as manager for the Pacific Coast, with headquarters with the firm of Henshaw, Bulkley & Co., who have been, for a long time, the agents of the Sullivan Machinery Co., and will continue to carry a stock of Sullivan rock drills and compressors.

THE Angels Iron Works of Angels, Cal., report new orders for their battery stem guide as follows: Melones mine equipment for 60 stamps; Lightner for 40; Angels and App mines, each for 40; Alto and Clary mines, each for 10 stamps.

Personal.

F. L. BOSQUI has returned from Mexico.

O. P. POSEY, of Los Angeles, is at the Palace.

JOHN OVERBURY of Bullfrog, Nevada, is in San Francisco.

NOEL G. HACKNEY is on his way from London to Brazil.

ROBERT T. HILL has returned to New York from Mexico.

L. L. PATRICK has returned to Goldfield from San Francisco.

J. S. COLBATH, formerly of Nelson, B. C., is in San Francisco.

W. W. BLOCKLEY is at Fairplay, Colo., from San Francisco.

CHARLES J. MOORE, of Denver, is expected at Goldfield, Nevada.

F. B. CALDWELL of San Dimas, Mexico, is at the St. Francis Hotel.

EDGAR NEWHOUSE of New York City is at the St. Francis Hotel.

CHARLES MOLSON has returned to Salt Lake City from New York.

ALBERT BURCH is inspecting mines in the Tonopah region of Nevada.

HENRY C. CALLAHAN sailed on the *Sierra* for Queensland on January 26.

GEO. R. SMITH has been elected president of the Canadian Mining Institute.

FRANK STRAUB and E. W. SEBBEN, of Denver, are examining mines in Arizona.

DOVETON & PURINGTON have moved their Denver office to the McPhee Building.

H. H. LEE passed through San Francisco on his way from Denver to Chihuahua, Mexico.

P. O. WELLS has been appointed superintendent of the International Ore Treating Company.

H. P. BUCKINGHAM, lately with Le Roi No. 2 mine at Rossland, B. C., is visiting San Francisco.

EDMUND JUESSEN, of Spokane, has opened a branch office in the Schmiedell Bdg., San Francisco.

WALTER M. BRODIE has returned to Chihuahua from a mining inspection in the Sierra Madre, Mexico.

FRANK R. CARPENTER, of Denver, has gone to northern Mexico, whence he will proceed to Lower California.

E. H. HOFFMAN, superintendent of the Carisa mine, has been made superintendent of the Silver Shield mine at Bingham, Utah.

EDWIN H. DAVISON has gone to the Amalie district, in Kern county, California, and will be absent from Fruitvale two weeks.

J. B. TYRRELL has changed his address for the winter from Dawson, Y. T., Canada, to 266 McLaren street, Ottawa, Canada.

C. A. HEAGLER, president Babispe Mining & Milling Co., has returned to Los Angeles from the Moctezuma district, Sonora, Mexico.

DUNCAN MCVICHIE of Salt Lake City is superintending the construction of the new smelter at the Balaklala mines, Shasta county, California.

W. J. ATKINSON, superintendent of mines for the Arizona Copper Co., at Longfellow, Ariz., has resigned and will go to Winnipeg, Canada.

F. H. MITCHEL has resigned as metallurgist Helvetia Copper Co. to become assistant superintendent Black Diamond Copper Co. at Black Diamond, Arizona.

JOHN E. STRACHAN has severed his connection with Bewick, Moreing & Co. in Western Australia to join the San Francisco office of the Midvale Steel Co. of Philadelphia.

LOUIS W. POWELL, assistant general manager of the Oliver Iron Mining Co., has resigned to become general superintendent of all the Bonanza Circle copper mines at Bisbee, Arizona.

EDWARD BRUSH has tendered his resignation as secretary of the American Smelting & Refining Co. The vacancy was filled by the election of W. E. MERRISS, who has been assistant secretary of the company for the past four years. G. M. BORDEN was elected assistant secretary.

Obituary.

GEO. TYNG, lessee of the Wyoming mine, in American Fork canyon, Utah, was killed by a snowslide at the mine January 19.

JOSEPH HEWLETT, formerly an engineer in the Comstock mines and for some time superintendent of the Gould & Curry mine, died at Stockton, Cal., on January 21, at the age of 77.

Trade Treatises.

Bulletin No. 62 of the Crocker-Wheeler Co., of Ampere, N. J., pictures electric hoisting machinery.

Westinghouse Electric & Manufacturing Co. of Pittsburg, Pa., describe Type C transformers in Circular No. 1126.

'Roofing Rules' has been received from Merchant & Evans Co., Philadelphia, Pa. This neat booklet is designed as a hand-book on sheet metals in building construction for architects, owners, engineers and builders.

'Tremain Steam Stamp,' Bulletin No. 1408, from Allis-Chalmers Co., Milwaukee, Wis., besides showing the construction of the stamp, contains an admirable treatise on milling and concentration tests. Bulletin 1704, from the same company, illustrates and describes lath mills and bolters.

SOLDER.—Half-and-half, 100-lb. lots, 23.50c; San Francisco, Plumbers', 100-lb. lots 19.75c.

ALUMINUM.—No. 1, 99%, small lots, 33@37c ℔ lb.; 100 lbs., 35c; 1000 lbs. 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market street, San Francisco, has official reports of the following United States patents issued to Pacific Coast inventors:

FOR WEEK ENDING JANUARY 9, 1906.

809,895.—FAUCET—Joseph O Beazley, Baltimore, Md.

809,549.—WIRE FENCE LOCK—Gottlob W Beyerle, San Diego, Cal.

809,550.—MAKING BORIC ACID, ETC.—Henry Blumenberg, Jr., Daggett, Cal.

809,903.—DREDGER SLEEVE—William F. Bowers, San Francisco.

809,552.—WOODWORKING MACHINE—John Buffelen, Tacoma, Wash.

809,607.—TEA-STRAINER HOLDER—Abraham Chundelah, San Francisco.

809,429.—RECORDING ICE SCALE—Charles E. Crane, Seattle, Wash.

809,434.—RAIL-JOINT CHAIR—Aurelius M. Ewing, Seattle, Wash.

809,676.—SICKLE—Pearl E. Fletcher, Ridge, Or.

809,293.—GAME APPARATUS—Albert Friedenthal, Oakland, Cal.

809,614.—INTERNAL COMBUSTION ENGINE—Henry C. Holloway, Gilroy, Cal.

809,617.—VENTILATOR FOR BASEMENTS AND THE LIKE—Peter H. Jackson, San Francisco.

809,692.—PENHOLDER—Ole Johnson, Cedarhome, Wash.

809,694.—BEET HARVESTER—Charles L. Jolly, Salinas, Cal.

809,870.—UNDERREAMER—Frederick W. Jones, Santa Paula, Cal.

809,383.—CLEANSING MANUFACTURED GASES—Leon P. Lowe, San Francisco.

809,580.—FLOOR POLISHING MACHINE—Frank B. Reichenbach, Los Angeles, Cal.

809,529.—ELECTRIC LAUNDRY IRON—Earl H. Richardson, Ontario, Cal.

809,632.—ANCHOR EMERGENCY AIR-BRAKE—Charles Z. Sanders, Sacramento, Cal.

809,542.—OIL TANK INDICATOR—William Torst, Jr., San Pedro, Cal.

809,548.—PRUE CONCENTRATOR—Louis R. Tulloch, Angels Camp, Cal.

809,649.—AUTOMATIC ATTACHMENT FOR CARBONATING APPARATUS—Henry W. Van der Vaart, San Francisco.

809,593.—REMOVING MINING DEBRIS—Simon W. Wible, Bakersfield, Cal.

EDITORIAL.

IT will be noted that our list of 'special contributors' has been increased by the addition of Mr. L. S. Austin, professor of metallurgy in the Michigan College of Mines, and Mr. F. L. Bosqui, metallurgical engineer and cyanide specialist. These gentlemen need no introduction to the mining community.

FAITH in dredging for gold in California has been demonstrated this week by the purchase, on the part of Mr. W. P. Hammon and associates, of the ground controlled by the Feather River Exploration Company and the Cherokee Dredging Company, a consolidation owning 975 acres at Oroville. The capital ($1,500,000) for the new company was subscribed in San Francisco.

WE learn that a bill has been introduced before Congress by Mr. F. E. Brooks, representative from Colorado, dealing with the establishment of a Department of Mines subordinate to that of Commerce and Labor. It is provided that the Geological Survey shall be attached to this department, after being relieved of its reclamation and forestry divisions. This anticipates the suggestions offered in these columns on January 13. We hope Mr. Brooks will succeed in securing congressional action upon a matter so important to the mining industry.

WHILE Salton Sea is a serious menace to the permanent way of the Southern Pacific Railway, it is an interesting subject of study to geologists. The waters are but returning to their own after many days, geologically speaking, for it is a fact that the Colorado river formerly flowed through this depressed area, forming a fresh-water lake which must have gladdened the heart of the desert. As the region became increasingly arid, this lake dried up, dwindling to a salt marsh, the bottom of which was 300 feet below sea-level. In the effort to drain this marsh, a ditch was cut to the Colorado river. But Nature has claimed her own, the river rose in flood and has broken through the barrier so as to cover not only the marsh but a tract 40 to 50 miles wide. Officers of the Geological Survey will shortly prepare a careful map of the region, so that it may be determined exactly what is best to be done. In the meanwhile, we may conjecture what will be the effect of introducing a large body of water into the midst of this arid region; if the river retreats, the existing lake will dry up and become again a small body of salt water; if, however, the Colorado can hold its own, this part of the United States may undergo climatic conditions of a character favorable alike to human habitation and cultivation.

Gold Dredging.

The comprehensive glance at the present state of the dredging industry, which we published in our last issue, will have interested many of our readers. Few men have such acquaintance with gold mining regions as the author of 'The Gold Mines of the World', and therefore Mr. Curle's letter commands respect. It was a useful communication, for not only did the writer of it give information, but he fulfilled the equally useful function of inciting donations of knowledge from others. Certainly the knowledge available on gold dredging is amorphous and incomplete; the only published book upon it is rubbish, because it was compiled by a man of no special experience. The best publication on the subject is the bulletin issued last year by our State Mining Bureau. Most of the articles heretofore written have been too vague, too little anchored to facts and figures; a few practical contributions emerge out of this mass of hazy literature and these have been prepared, almost without exception, by Western engineers. But there is much to be done before the gaps in our information on this important branch of mining are filled. Mr. Curle specifies the several points concerning which we need facts and figures, and we are confident that among our readers there are men able and willing to contribute what is wanted. Already we are enabled to publish a special article on the testing of dredging ground, with a workmanlike description of the methods to be used in checking such results. To the younger men especially, we commend this contribution, by Mr. Norman C. Stines, as an excellent bit of technical writing; it is no pretentious essay or generalized rumination, but a straightforward record of actual practice told in terms readily understood, and calculated to have immediate practical application. If we could get half a dozen such articles on gold dredging, technical literature would be sensibly enriched.

As to prospecting ground with drills, it is said that the Oroville experience has shown a yield by dredging from 70 to 85 per cent of that given by drilling tests. It is just such statements as this that are useless, although apparently businesslike. The value of a series of drill-holes as indicating the richness of a tract of gravel cannot be gauged by any empirical formula. It is as absurd as the practice of timid engineers who cut their estimates of ore in two or deduct a certain fixed percentage from their calculations, so as to be safe. In the case of drilling before dredging, the result is reliable according to the number of holes, the distribution of them, the care taken in the work and, above everything, the personal factor. Such work carefully done and checked at each stage by a man of experience and integrity needs no big discounting, while that accomplished by an unreliable driller or a careless novice is worse than worthless. No fixed percentage covers the varying conditions surrounding an engineering operation.

In the early days of dredging it was the custom to test 200 acres with 10 drill-holes; nowadays one hole to two acres is not uncommon. When results indicate that the gravel is of varying depth, that there are irregular channels or that the ground is spotty, it is not unusual to put down as many as one to three holes per acre, especially where no adjoining workings exist, such as throw light on any anomalous results from the drilling. The cost is a limiting factor, for each hole costs $60 to $100 in ground of any considerable depth.

It is generally assumed that the results given by shaft-sinking are more reliable than those from drill-holes; as a rule this is true, but the comparison too often smacks of the old idea that a mill-run is more trustworthy than the sampling of ore in a mine. It depends upon how it is done, with this proviso, that the more men needed to carry out an operation of sampling, the greater the opportunity for error, intentional or unintentional. A shaft gives better opportunity for examining the nature of the successive layers of gravel and other conditions that bear upon the subsequent working of the ground. Careful measurements are imperative; sometimes it is not practicable to hold the same diameter of shaft all the way down, and in running ground one has to resort to timbering; these factors affect the cross-sectional area and must be carefully noted in any calculations. Moreover, instances are known where shaft results have been seriously vitiated by the fact that the particles of gold have fallen to the bottom, with the water, so that the upper layers of gravel appeared worthless, while that immediately above bedrock was excessively enriched. Great caution, bred of experience, is required to make an accurate test.

A Suggestive Discovery.

One of the most important developments made at Bendigo, the deep-mining district of Australia, is the discovery of another saddle-reef at 2,200 feet in the Catherine Reef United mine. In places, the stoping width is 50 feet. The gold-bearing formation is intersected by a lava dike, the western side of the lode being solid quartz, while on the other, or eastern, side of the dike there is a series of spurs, making away from the lava. The spurs constitute the richest ore, although the solid quartz is good enough to stope. From the first discovery of this orebody it has been noticed that the quartz associated with the lava has been best. A recent return gave 337 ounces from 260 tons. Apart from affording encouragement to those working this lode, known geologically as the Garden Gully anticlinal axis, the distribution of the gold in proximity to the lava gives valuable evidence concerning the enriching effect of the dike which forms the youngest feature in the structural geology of the district. It is apparent that the dike followed and filled a fracture which reached the surface, through the slate-sandstone country and through the saddle-reefs already formed; that this intrusion coincided with, and was followed

by, thermal activity, producing further deposition of quartz and precipitation of gold. The formation of the later gold-bearing quartz was facilitated by passageways identified with the dike and subsequently also by the shrinking of the lava when it cooled.

Mining and Geology.

The discussion growing out of the letter on 'Mining Engineers and Geologists,' which appeared in our issue of January 6, has developed usefully. Such frank give-and-take of opinion makes for a better understanding between professional men and creates a clearer idea of the value to be attached to specialized knowledge. This week the discussion is rounded by two practical contributions, one by a mining geologist who has proved the usefulness of applied science and the other by a successful mine operator who knows how the commercial purpose of mining can be furthered by men of especial training. The case has rarely been better stated than it is by Mr. Requa and we commend it to our professional brethren. He asks for co-operation between the miner—as represented by the mine manager—and the scientist, as he comes in the person of a geologist. No man can cover every phase of an industry so broad as mining; the big blunders are made by those who think it a sign of weakness to disclaim full knowledge of a special subject. As a matter of fact, the manager of a big mine is so absorbed in his executive duties, in the commercial part of the business and in his routine work, that it is rarely he can expect to make a proper study of geological conditions underground. Every mine is not a geological puzzle; some are plain sailing for years at a time, but when geology is a factor, it becomes paramount. In such cases it is the superintendent or a wide-awake observant shift-boss who puts two and two together; often with success, but just as often without it, simply because the problem is one that requires more than local knowledge and more than the most illuminating of horse sense. It is then that the manager, if a broad man, with the courage of his convictions, will ask his directors to send a good geologist, versed in ore deposits, to his assistance. At such a time the manager will be fortunate if he has made the acquaintance of one or two geologists and is able to choose his specialist, instead of leaving the selection to his directors.

There is a reason for the growth of specialization in mining geology and we shall state it frankly without incurring the risk of being misunderstood. The typical American mine manager is not a geologist nor necessarily is he a good miner; he does not go underground often enough. The ability which has placed him at the head of his profession, for example, in Africa and Australia, is not that of a successful finder of ore nor that of a skillful miner of such ore when found; he is pre-eminent as a business man, first of all; as an intensely energetic resourceful man of affairs; often he is a clever mechanical engineer, and therefore a successful designer of mills and reduction works, but neither by heredity nor by training is he a good miner. There are exceptions—please note—but we speak of the type that has done such credit to the name of American mining engineer. Now, the explanation for this is not far to seek. He does not care to go underground any more than the American workman cares to do so. The miners of the world today are Cornishmen, Finns, Italians; the trammers are Irishmen and Swedes; the timbermen are Cornish again, with Austrians, Welshmen and Piedmontese. The native American is at surface; he is holding the brakes of the hoist, he is working the lathe in the repair shop, he is carpenter, blacksmith, mechanic; he is in the mill. In our issue of last week, Mr. Plate called upon the younger men to make friends with the mine superintendent and shift-boss; it was sound advice. We also advise them to spend more time in the mine, and learn—what some excellent people overlook—that more money is lost by bad mining underground than by poor milling or insufficient machinery at surface. Geology in its application to mining is not learnt in the sunlight nor under the soft rays of a student's lamp, it is acquired in the dim places of the underworld where keen observation is the wick and logical reasoning the oil, of a lamp guiding the miner through a darkness that can be felt. Men engage doctors when they are ill, instead of hiring them to keep them in good health; so also mine operators and managers engage a high-priced specialist when they have become thoroughly tangled in geological perplexity instead of regularly retaining a competent adviser, whose salary per annum would be no more than that of the specialist who comes once and for a short time to study conditions with which previously he may have had no acquaintance whatever. We bespeak a better recognition of the importance of geological knowledge and mining experience as applied underground; it is the necessary foundation for the business insight that directs operations at the surface.

The Price of Tin.

Tin is fetching a high price these days. It sells at New York for 36 cents per pound, while the average price in 1904 was 28 cents. The world produces only about 90,000 tons of the metal at the present time, the output of the Malay States having declined about 5 per cent, while the Australian production has increased slightly. In Alaska there is promise of production, but the supply from this source has not yet affected the market. The world's consumption of tin (of which the United States takes nearly one-half) has overtaken the output and the stocks of 40,000 tons in January, 1897, have dwindled to 13,500 tons in January, 1906. It is the known smallness of the visible supply that has caused such speculation in the metal; the consumers are carrying only the amount absolutely necessary and are living from hand to mouth. Owing to the time—three months—required to carry tin from Singapore to New York, a tonnage equal to a quarter of the annual consumption in America is unavailable at any time. Any check to regular shipments will precipitate a famine in tin. Unless the supply is forthcoming and production is put on a healthier basis, it is likely that a substitute will be sought by those who now use tin for plating iron.

Absorption of Mineral Land.

Absorption of valuable mineral land by railroad corporations has gone so far as to elicit vigorous protest by those who have a care for the future of Nevada's mining industry. Senator George S. Nixon, of that State, has presented a petition to Congress asking that a commission be appointed to enquire into the matter; this petition has been referred to the committee on Public Lands. Those who feel that action is imperative, will do well to write to their representatives in Congress, asking them to support the measures already taken. The intention is to appoint a commission similar to that which exists already in the States of Idaho and Montana, the duty of which is to pass on the character of the lands within the grants made to railroads. While the law giving the railroads certain concessions of territory is not attacked, there is vigorous protest against the rulings of the Land Department whereby they are given more than they are entitled to receive. In making grants to the several States and in aid of the construction of railroads, the Federal Government expressly provided for the reservation of mineral land. From the first it was the settled policy of the Government to reserve such mineral land, from sale, from pre-emption, and from all grants whether for railroads, public buildings or other similar purposes. The Acts of 1862 and 1864 contain provisos to this effect. The Land Department has jurisdiction over railroad lands, until patents are issued, for the purpose of determining whether the conditions have been complied with. It is said that in advertising the application of railroads for such land, the officials of the Department choose newspapers a hundred miles or more from its location; and the notices are so phrased that their import is not readily deciphered; this has caused bad feeling in Nevada which was aggravated by the publication recently of a letter wherein the Commissioner of the General Land office said that "there is no authority for the insertion in patents issued under railroad grants of the clause (exempting all mineral lands, should any be found in the tracts aforesaid) and directions are given that in all future railroad patents, said exempting clause be excluded." Clearly it is time to ventilate this important matter, and to prevent the alienation of mineral territory belonging to the people.

By the Way.

At the anniversary meeting of the Royal Society held recently in England, Sir William Huggins took for a text the influence of modern science upon the life and thought of the world. He said:

The influence of science during the last 50 years has been in the direction of bringing out and developing the powers and freedom of the individual, under the stimulation of great ideas. To become all that we can become as individuals is our most glorious birthright, and only as we realize it do we become, at the same time, of great price to the community. From individual minds are born all great discoveries and revolutions of thought. New ideas may be in the air and more or less present in many minds, but it is always an individual who at the last takes creative steps and enriches mankind with the living germ-thought of a new era of opinion. All influences, therefore, and especially all laws and institutions which tend to lose the individual in the crowd, and bring down the exceptional to the level of the average, are contrary to the irresistible order of nature, and can lead only to disaster to the individual and in the State.

I should not omit to mention the marvellous secondary effects of scientific discoveries upon the mental progress of the civilized world which are being wrought by their practical applications to the cheapening of paper, and to improvements of the automatic printing press, which, combined with the linking together of all parts of the earth by a network of telegraphic communications, put it in the power of even the poor of the realm to read daily the news of the world, and for a few shillings to provide themselves with a library of classical works. Of scarcely less educational influence upon the public mind are the new methods of photography and mechanical reproduction by which pictures of current events and the portraits of those who are making contemporary history, and also copies of the world's masterpieces of painting and of sculpture, are widely disseminated with the cheap newspapers and magazines among the mass of the people. Golden will be the days when, through a reform of our higher education, every man going up to the universities will have been from his earliest years under the stimulating power of a personal training in practical elementary science; all his natural powers being brought to a state of high efficiency, and his mind actively proving all things under the vivifying influence of freedom of opinion. Throughout life he will be on the best terms with nature, living a longer and a fuller life under her protecting care, and through the further disclosures of herself, rising successively to higher levels of being and of knowledge. The importance to every man of a practical acquaintance with elementary science is obvious. Would it be thought possible that any nation could act so absurdly as to teach its children other languages, and leave them in complete ignorance of the tongue of the land in which they would have to pass their lives? Would it not then be incredible, if it had not become a too familiar fact, that the public schools have, until recently, excluded all teaching of the science of nature from their scheme of studies, though man's relation to nature is more intimate than to his fellow countryman? We live, move and have our being in nature; we cannot emigrate from it, for we are a part of it. Yet our higher education leaves men, who in other directions are well informed, much as deaf-mutes in the presence of nature. They do not hear her most imperative warnings, and can only get on haltingly in their everyday intercourse with the natural forces to which their lives are subjected, by means of the arbitrary signs of empirical custom. The recent introduction of some amount of science-teaching in our higher schools is inadequate, in kind and in degree.

Two faculties of the mind, which it is of the highest importance, especially in early youth, to enlarge and develop by exercise, are wonder and imagination. Under the ordinary premature language-teaching of the grammar schools, even the wonder and imagination natural to young minds become so stunted in their growth as to remain more or less dormant throughout life. On the other hand, natural science brings them into full activity and greatly stimulates their development. Nature's fairy tales, as read through the microscope, the telescope and the spectroscope, or spelt out to us from the blue by waves of ether, are among the most powerful of the exciting causes of wonder in its noblest form; when free from terror it becomes the minister of delight and of mental stimulation.

And surely the master creations of poetry, music, sculpture and painting, alike in mystery and grandeur, cannot surpass the natural epics and scenes of the heavens above and of the earth beneath, in their power of firing the imagination, which, indeed, has taken its most daring and enduring flights under the earlier and simpler conditions of human life when men lived in closer contact with nature and in greater quiet, free from the deadening rush of modern society. Of supreme value is the exercise of imagination, that lofty faculty of creating and weaving imagery in the mind, and of giving subjective reality to its own creations, which is the source of initial impulses to human progress and development, of all inspiration in the arts, and of discovery in science.

CONCENTRATES.

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and to give information dealing with the practice of mining, milling and smelting.

WATER used in mixing concrete should be clear and free from sulphuric acid or strong alkalies.

THE San Francisco Mint was established in April, 1854. It has coined more than one and a half billion dollars in gold and silver.

'TAILINGS' from stamp-mills should always be conveyed far enough so that in the future their accumulation will not prove a source of expense.

WHEN there is a poverty of lead in lead-silver ores treated in a smelting furnace, and excess of zinc and magnesia, there is usually a heavy loss of silver in the slag—from 1½ to 4 oz. per ton.

THE largest output during any single year of the Comstock was in 1877, when it produced $14,520,614.68 in gold, and $21,780,922.02 in silver, from ore, and $1,169,265 from tailings, a total of about $37,500,000.

IF delayed assessment work on an unpatented mining claim had been commenced before January 1st and was continued until the full $100 worth had been performed the claim was not subject to re-location, and title still rests in the original proprietor.

THE peculiar silicious, granular ores of the Great Republic mine at Republic, Washington, were not shipped to smelters to be used as flux, but to line converters, for which purpose it was peculiarly adapted, consisting of a semi-pulverized mass of quartz, ranging from small lumps down to fine sand.

THE function of the canvas slime-plant is to save the extremely fine sulphides which escape vanners or other kinds of mechanical concentrators, where sizing and classification are not practiced. Where a properly designed and operated sizing and classification process is employed the slime-plant is generally not required.

RHYOLITE is scarce in the Coast range of California. One occurrence is known in Santa Clara county, near the New Almaden quicksilver mine, and north of Berkeley is an extensive outcrop of soda-bearing rhyolite of unusual variety. Although this latter rock contains finely disseminated pyrite, no occurrence of gold or silver in it has been reported.

THERE is no relation between altitude and the value of a mine, excepting the economic relation of cost and output. It is a bad idea for the prospector to entertain hard and fast rules in relation to any matter having a bearing on prospecting, either as to the kind of rock in which to search for mineral or as to the altitude at which payable ores may or may not be found.

THERE still remain in California several hundred miles of undeveloped and practically unknown ancient, gold-bearing, river channels. The uncertainty of their depth and position, as they are buried beneath hundreds of feet of later lava, renders their discovery and development somewhat hazardous, but as a class the mines of the ancient channels have been largely remunerative.

MUCH ATTENTION has been given by some investigators to the electro-magnetic currents noted in mines in connection with ore bodies, but as yet it is not known that any practically valuable deductions have been made from these studies, except possibly to afford fakirs of the 'divining rod fraternity' the means of promulgating a class of scientific literature with which to be-fool the ignorant.

NARROW slit-like cracks, which cross the schistosity of greenstone and other rocks, are called shrinkage cracks and are supposed to be due to some stress which caused the rock to stretch, with the opening of the transverse cracks referred to. Sometimes they are found as open spaces, and occasionally are found filled with calcite or quartz, or some other mineral, infiltrated since the formation of the cracks.

THE mines of Cœur d'Alene district of Idaho are not situated in high rugged mountains, but in smooth-sloped hills, at altitudes ranging from 3,000 to 4,500 ft. The rocks of the district are slate, quartzite, gray-whacke, syenite and some small dikes of basic rock described as basalt. The principal mines are in the quartzite, though ore also occurs in the syenite, near its contact with the sedimentary rocks.

IN an alkaline solution, hydrochloric acid, and also nitric acid, may cause a precipitate when there are present either silicic acid, boracic acid, antimonic acid, tungstic acid, molybdic acid; also oxides soluble in alkalies (such as plumbic oxide or alumina, soluble in excess of nitric acid), as well as metallic cyanides and ferrocyanides, and all metallic sulphides soluble in ammonic sulphide. A precipitate of sulphur may also be formed in soluble polysulphides and hyposulphites.

WHERE the general fall of a country is much greater than is necessary in the construction of a ditch line, the excess of grade may be equalized by giving the ditch a heavy fall at some place where no damage will result from cutting. Where on the ditch the earth or rock is so porous that there is a heavy loss by absorption, it is better to lay a flume or pipe on the grade until such bad place has been passed.

NO ONE believes a lawyer can master his profession in a month or a year by simply reading law, nor can one become a competent civil engineer without a long course of preparation, to which must be added practical experience. The mining engineer must take a course more extensive and comprehensive than that of any other profession, and yet many people think anyone can successfully operate a mine.

SO FAR as known to "Concentrates" no one has yet been able to satisfactorily explain the origin of the peculiarly matted and twisted wires of native silver occurring in many ores. These are particularly abundant in Arizona and Colorado. They often look like wires which have been drawn through a ragged plate, and are found twisted, gnarled and interwoven in a strange and unaccountable way.

THERE is a law on the statute books of California making it mandatory for a mine worked by shaft, either vertical or incline, to have two shafts connected by level when the workings exceed 300 feet in depth, but no attempt has ever been made to enforce the provisions of this law. In the Mother Lode region many adjacent properties are connected underground, which aids ventilation and meets the requirements of the law.

DIATOMACEOUS EARTH (infusorial earth) is used as an absorbent and also more extensively as a fine abrasive, such as tripoli, rottenstone and other polishing powders. It consists principally of silica and is often so fine in texture as to convey little sense of grit to the touch. It has also been successfully employed as a covering for steam pipes, boilers, etc., and it has been suggested that it would make good material for filling fireproof safes.

THE highest and lowest places in the United States are in Inyo county, Cal. Mount Whitney is 14,522 ft. above the sea, and Death Valley, 50 miles southeast of Mount Whitney, is 300 ft. below the level of the sea. It is said that Mount Shasta and Mount Whitney may both be seen from the summit of Mount Diablo, in Alameda county, on a clear day. The distance from Diablo to Shasta is 244 miles, and from Diablo to Whitney 222 miles.

WHEN a copper furnace has become dark in the tuyere zone, and the fire has worked toward the top, one good way to remedy the difficulty is to feed matte charges instead of ore. Unless the trouble has advanced too far, the tuyeres will soon become bright again, when the matte charges may be decreased to one charge of matte to two or three or more charges of ore. Another method is to reduce the blast somewhat and plug some of the tuyeres temporarily.

THE so-called "Joshua" trees of the Western desert region are a species of yucca, portions of which upon drying sometimes become very hard, and make excellent fuel. The greater part of the tree is almost useless for fuel, but the hard, dry pieces, which may usually be found scattered about on the ground in the yucca country, are superior to any other kind of fuel found on the desert. Ironwood and mesquite are also used for fuel on the desert.

THE amount of water required per ton of ore treated by coarse concentration varies with the character of the ore, those ores containing much clay or talc requiring more water than those of purely silicious or other brittle gangue. Generally it is about 4,000 gal. (about 15 tons) to one ton of ore. Where water is scarce much of it may be pumped back from settling dams for re-use, when the loss may not exceed 25%, which greatly cheapens the cost of water required.

THE lead-silver ores of Leadville, Colorado, are supposed to have been deposited in the limestone strata, where they are now found, at a depth of probably 10,000 ft., as indicated by the regional geology of that portion of the Mosquito range. Subsequently the rocks were fractured, faulted and slowly uplifted, while glaciers and other erosive agencies combined to disintegrate and scour away the overlying sediments and porphyries, thus exposing or bringing the ore deposits near to the surface.

THE most important theories advanced to account for the occurrence of petroleum in Nature are: 1. That it is the result of chemical affinity acting on mineral matter. 2. That it is the result of partial decomposition of organic matter, either vegetable or animal, that has been stored up in the rocks. 3. That it is of direct volcanic origin. The last seems entitled to little consideration, as no direct evidence has been produced to support it, and no petroleum is known to occur in large amount in association with volcanic rocks. Petroleum differs in composition and character in different regions and in different rocks. No one theory of the origin of petroleum satisfactorily accounts for all of its many variations of character and occurrence.

A GALLON of water contains 231 cubic inches and weighs 8⅓ pounds. In making cyanide solutions exact calculations are not made. For instance, a 1% solution is made by dissolving 20 pounds of cyanide of potassium in a ton of water. The addition of the cyanide makes the solution weigh 2,020 pounds, so that the amount of cyanide present is really less than 1% of the total weight. The conventional method of making up solutions is convenient and devoid of hair-splitting niceties which would be without practical benefit.

PORTLAND cement is made by mixing in proper proportions calcium carbonate and clay which are heated to expel moisture. The mixture is then pulverized and calcined at a high heat, which produces the so-called clinker which is then finely ground. Cement, to be of usefulness, must pass a screen of 10,000 meshes per square inch. Cement for tests, taken from barrels, is obtained by boring a hole through one of the staves about midway between the heads of the barrel and removing a portion of the mixture with a sampling iron similar to those used in obtaining samples of moist concentrate in a stamp-mill.

WHERE it is deemed advisable to re-grind a portion of the tailing from a mill, an arrangement should be made to accomplish this automatically and at as little expense as possible. If the coarse sand requires re-grinding, it can be separated from the fine by the employment of hydraulic classifying cones or other similar devices. This coarse sand may then be sent to a grinding mill situated on some lower level and operated by surplus or auxiliary power, the sand feeding and discharging automatically. By an arrangement of this kind the cost of re-grinding tailing is reduced to a very low figure, as no particular attention need be given it, the expense being chiefly for power and wear of working parts.

THERE are several ways in which small shafts and tunnels of ordinary cross-section and length may be ventilated. Among these are the windsail, which, catching the passing breeze, forces it through a pipe to the working face; the furnace built at the surface and connected with the ventilating pipe, which draws the foul air from the mine, its place being taken by pure air which flows into the opening; the water blast, in which a column of water falling into a vertical pipe imprisons air as it falls and drives the air into the mine through the ventilating pipe. The ventilating fan is the most commonly employed, but the substitutes previously referred to are generally less expensive in operation.

MOUNT SHASTA and Lassen Peak, in California, together with the several score of lesser volcanic cones and vents, have ejected an enormous amount of material in the past. The accumulation of volcanic rock is several thousand feet in thickness, filling a great pre-existing basin which once separated the northern end of the Sierra Nevada from the Klamath mountains of northern California and southern Oregon. The latest volcanic eruption in California, and probably in the United States, is that at what is known as the cinder cone, about 10 miles east of Lassen Peak. In the bed of cinders and ashes which surrounds this cinder cone still stand the snags of pine trees, killed by the heat and gases accompanying the last eruption of volcanic debris in this country. Just how long ago the last outburst occurred is not positively known, but is placed within 100 years. Although no eruption has occurred since the settlement of the State by white people, there is no assurance that an eruption may not recur in the Lassen Peak region at any time, though there is no indication of any such approaching catastrophe at present. There are numerous hot springs and steam vents in the region which indicate that the fires are only slumbering.

THE usual method of estimating the horsepower for a mill is by units of five stamps to each mortar. Multiply the weight of a single stamp by the number of stamps in each mortar, and this by the height of drop in feet, and the product by the number of drops per minute. This gives the foot-pounds. Add to this from 25 to 30% for friction. Divide the whole by 33,000, and the result will be the power required for each unit of five stamps. A 40-stamp mill having 1,000-pound stamps, dropping 6 inches 100 times per minute, would then require for the stamps alone, $1,000 \times 5 \times 0.5 \times 100 = 250,000$. Add to this 30% for friction $= 325,000$ foot pounds $\div 33,000 = 9.85$ h. p. for each five stamps and for 40 stamps eight times as much, or 78.8 h. p. For rock-breakers, concentrators, clean-up barrels, and other machines used in and about the stamp-mill, it is usually safe to figure 3 h. p. to the stamp, and this will be found sufficient where the stamps do not exceed 1,000 pounds in weight. If much heavier and dropping faster than 100 times per minute, a larger factor must be allowed. Often mills which are hastily built of unseasoned lumber, although properly planned and the shafting placed with care, on drying the shafting is thrown out of line by the warping of the timbers. This is a contingency which may be anticipated, and the shafting should be gone over quite frequently the first year or two and readjusted, or the loss by friction will be heavy.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy.

FINE GRINDING.

The Editor:

Sir—In the discussion on this subject in your issues of December 16 and January 27, several interesting questions arise. Is fine grinding necessary to the highest extraction by cyanide? Does fine grinding improve amalgamation? Are the best commercial results obtained by fine grinding? Mr. Doveton's definition of the term will bear amplifying. In this country 'fine grinding' is generally understood to mean a secondary comminution of the mill-tailing through 150-mesh or finer, after the usual mill treatment by amalgamation or concentration, or both. All the parties to this discussion seem to be of one opinion as to the effectiveness of this secondary grinding. Even Mr. Doveton, who is apparently not a very warm advocate of the system, concedes, by implication, that it aids extraction, but is only in a few instances commercially profitable. It seems to be a settled fact then that cyanide solutions will yield the highest extraction from finely crushed material. The exceptions to this are so rare that the fact may be safely accepted as one of the axioms of cyaniding.

The effect of fine grinding on amalgamation is a subject which, curiously enough, has been thrust into prominence by recent developments in cyaniding. I do not know of any instance where amalgamation is used after the fine grinding or sliming operation; although it is said to have been tried with some success in South Africa, and in Korea. I think it has been the experience of mill-men that crushing finer than the approved and traditional 30 or 40-mesh rather hinders than aids amalgamation. In the Goldfield district, Nevada, the practice is to re-crush the coarsest of the 16 or 20-mesh product from the stamps in Huntington and Bryan mills. This has the effect of brightening the characteristically reddish-colored gold of the district, as well as to release the mineral imbedded in the coarse particles of quartz, and the use of large amalgamating plates after the second crushing has been of distinct advantage. My belief is that amalgamation, in cases where the gold does not amalgamate readily, and where re-crushing is necessary for the highest extraction by cyanide, may be best carried on in two stages, especially where—as in the case of the Combination mill at Goldfield—the second crushing does not reduce the ore to finer than 40-mesh. When Mr. Wann speaks of "fine grinding having proven a pre-requisite for the highest extraction by amalgamation and cyanide leaching of gold ores," he implies that it is now considered an essential to good amalgamation. It would be interesting to know of the special instances wherein this practice has improved amalgamation.

Mr. Doveton's views on fine grinding, discrediting this aid to high extraction as commercially unprofitable, will be received with some surprise by companies now using tube-mills in this country and in Mexico. Several such mills are in operation at El Oro; Mr. Butters is installing them on his Mexican properties; the Liberty Bell company at Telluride, Colorado, and the Standard company at Bodie, California, have tube-mills in operation, apparently at a cost per ton which justifies their use. If fine grinding is a commercial success in Australia and at the various properties above named, all working on dissimilar ores, it must have decided merits. Obviously, the profitableness of this additional grinding will depend in each case on the margin of saving. If sliming a $2 sand will raise the extraction by cyanide from 80% to 90% and the operation costs 50c. per ton, manifestly it will not pay. But if such an increase of saving is made on $10 sand, it *will* pay. It seems impossible to generalize briefly in estimating the value of a process, the success of which must depend upon so many inherent conditions. My own experience in fine grinding has been somewhat happier than Mr. Doveton's; though I must admit that, while an advocate of this method, I have not had occasion until recently to instal a tube-mill or grinding-pan. What knowledge I have of the subject has been gathered from experimental work and from available data of plants in operation. I assume that Mr. Doveton has drawn his conclusions from reliable results, that is, from fair tests on a working scale over a considerable period. Obviously a mere experimental test to determine cost of treatment would not be conclusive. Those interested in this important subject would be glad to know specifically from Mr. Doveton the cases in which he met with failure in plants resorting to fine grinding on a scale large enough to afford reliable data. Such information would be of especial value at the present time.

In the treatment of silver ores by cyanide I am disposed to take a middle ground between the extreme views held by Mr. Wann and Mr. Doveton. Agitation of finely crushed silver ores for the long period usually required for the best extraction is in most cases neither practicable nor economical. In the treatment of such ores I have obtained the best commercial results by re-grinding to a fine sand (60 or 80-mesh) and leaching this product from 15 to 20 days, after a careful separation of the slime. The pure slime, by reason of the fine state of division of the mineral, does not require more than three or four days' agitation for the best results.

Mr. Doveton calls timely attention to the Blaisdell apparatus for emptying and filling tanks, and for carrying sand from one tank to another. The merits of this system from all points of view were tried and proved at the Butters plant at Virginia City. I am informed that two large cyanide plants now in course of erection in Mexico are to be equipped with this apparatus, as well as the new 500-ton cyanide plant of the Tonopah Mining Company at Tonopah, Nevada. In districts where the price of labor is high, or where cheap labor is uncertain and unreliable, as in parts of Mexico, the value of a mechanism of this sort is incalculable.

The evolution of slime filtering is one of the most interesting of recent developments. Filter-presses were never popular or much used in America. The Moore process, at first installed at the Golden Gate mill at Mercur, Utah, was soon discarded, but was later introduced at the Lundberg & Dorr mill at Terry, South Dakota, at the Liberty Bell mill in Colorado, and at the Standard Company's mill, at Bodie, California. At all of these places it is said to be operating successfully. Cassell introduced an important modification of the Moore filter by practically reversing the operation, that is, conveying the pulp and the various solutions to a box carrying stationary filters, instead of shifting the filters, as in the Moore scheme. The merits of these two types of filters were thoroughly investigated at Virginia City, where, after several months of quiet and earnest work, the Butters-Cassell filter, so-called, was finally evolved. This is now in use at the Butters plant, where 150 tons of slime per day are being filtered at a cost of 11½c. per ton. The system is very simple and works with a convincing smoothness and precision which appeal at once to the practical eye. At the mill of the Combination Mines Company at Goldfield, this process is being installed to treat 40 tons of high-grade slime per day. The filter-press which has been in service for several months will be discarded as too expensive to operate.

FRANCIS L. BOSQUI.

San Francisco, January 27, 1906.

MINING ENGINEERS AND GEOLOGISTS.

The Editor:

Sir—There is much that is true in what Mr. Forbes Rickard writes, but surely it is hardly fair to the mining geologists, to picture one "who has crowned himself with a halo of self-approval" and contrast him with some accomplished mining engineer, who is assumed to be possessed at once of thorough experience in his profession and gifted with good 'horse sense.' Is it not true that in every walk of life we meet souls enveloped, as the mountain top is hidden in the cloud, in an atmosphere of self-approval? A Norwegian minister once asked me: "Why is it a man what thinks he knows everysing, knows nothsing?" I assented to the often observed fact and awaited the explanation: "It is the act of God; if God let him know anysing, he would remind God of it dis-a-gree-bly. It is ze self-protection of God."

What is the object of scientific training? Is it not to prepare the mind to observe and to reason from that which has been observed? As the crust of the earth is—by fissuring and the intrusion of igneous rocks—prepared to receive and to concentrate within itself the later deposited ore—so the brain can be trained to be in the highest degree receptive and to classify the facts observed. Why does the scientist know more than the man of equal ability but without the preliminary training, who has devoted the same number of years to his profession? May it not be because one has been like a savings-bank, receiving and accumulating the observations of the most intelligent investigators and thinkers in all parts of the world and adding them to his own wealth, while the other has mainly his personal store of observation and experience. Within the country he knew, the practical man would have the superior knowledge, until he came to deal with conditions that were beyond his experience. The best possible work would result, were the geologist and the mining engineer to unite their forces.

There are, however, many questions in mining which are purely geological. Take, for instance, the case of a vein nearly vertical in attitude, cutting through flat-bedded formations and changing its wall-rock with every change in the strata. The mine has been very productive in the upper levels where the vein traversed hard crystalline rocks, and the question arises: to what depth will these favorable conditions continue, and what will be the nature of the underlying formation with respect to the occurrence of ore? Will the vein become barren on entering the lower beds? Then there are a great variety of cases where the ore is cut off by a fault. Was the ore there first, or was the fault formed prior to the ore and the mineral deposited against the fault-plane? If from any cause the output of the mine is decreasing and new orebodies must be sought in unexplored parts of the property, the services of the mining geologist are of value in determining the areas which shall be explored. Sometimes he is called upon to direct the work; to determine at the outset the probable position of the 'mineral centers', the places where the main up-flow of the waters bringing in the ore has occurred, and to plan the work so that the exploration shall be confined to a limited area, surrounding such centers; for often it is not economically practicable to cross-cut and explore all the territory owned. A railroad proposes to build a branch to a mining camp; it has been ascertained that the mines have sufficient ore developed to last two or three years, the mining geologist is called upon to determine the probable life of the camp, to give his opinion as to the output, after the reserves are exhausted. Other instances might be given where there is no occasion to apply "the gauge of the sample, the assay-office and the tape."

There are mining geologists who are mining engineers as well "who are not afraid to meet the commercial question"; but I feel sure that Mr. Rickard did not intend to hit at that class. He is to be commended for the courteous and conservative way in which he handles the subject, for he shows that he can hit hard.

WALTER P. JENNEY.

San Francisco, Jan. 20, 1906.

MINING ENGINEERS AND GEOLOGISTS.

The Editor:

Sir—The communication from Mr. Forbes Rickard, in your issue of January 6, touches upon a subject that is of material importance to the mining public. So far as I know, there has been but little discussion of the relations of the so-called 'Mining Geologist' to mining enterprises. I am somewhat averse to the use of the term 'Mining Geologist,' as placing an undesirable limitation upon the work of a geologist, and at the same time giving an erroneous impression of his field of usefulness. I have not in my experience come in contact with any really eminent geologist, who would be willing to accept the name of 'Mining Geologist' as a limitation to his work; nor, in fact, have I ever met any geologist, who, standing alone, was able to pass upon problems surrounding mining work.

In its transcendent dress, geology is not adapted to the solving of purely commercial problems, and specializing in this field, in my opinion, has a marked tendency to unfit the specialist for any work other than strictly geological investigations. There is, however, a relation between the geologist and the mine manager, that can be established with marked benefit to both. With the mine manager, the question paramount is the deriving of profits from a property; and the geological problems that may be developed are attractive to him only in their bearing upon the financial part of the question. Unfortunately with the geologist, it is often a question of mere geological phenomena, in the solving of which the commercial aspect is entirely lost sight of. To the mine manager the minute differentiation in rock structure is not a matter of vital importance. Unfortunately, however, the geologist views these finer determinations with much enthusiasm and often more interest is manifested than in the discovery of large areas of pay-ore. To the specialist in geology, a vein may be entirely barren of valuable minerals, but if it presents complex structures, it may attract his attention far more than the simple vein-structure which carries ore in payable quantity, but which presents no geological problems.

There is a field for the geologist in mining work, exactly as there is a field for the mine manager, and it is when confined to this field that the results of the geologist's investigation will be most beneficial to all concerned. To secure the greatest benefit from his labors, his work should be directed by the mine manager, who has certain commercial problems to solve, in the solving of which certain geological questions must be determined. When the mine manager has satisfied himself upon the points regarding which he wishes enlightenment, it is opportune to call upon the geologist and explain the particular geological problem and get from him a solution. That the solution may be incorrect is quite possible, but it is the province of the mine manager to then determine whether the solution is one that from a commercial standpoint admits of satisfactory determination by further mine exploration; or it may be that the solution points to the abandonment of the undertaking. The mine manager must examine carefully all phases of the question and then determine for himself the amount of weight to be placed upon the geological report submitted to him.

The modern mine manager, if at all competent for the position he occupies, is necessarily more or less versed in geology as applied to mining problems. He may, in fact, be much better fitted, from his long association with any given property, to solve the question than the specialist who is called in consultation.

All properties of any magnitude should have a geological map of their holdings; this information may be at times of extreme value. This is not so

applicable to the simple vein-structures of California as to the irregular deposits of Nevada and to other similar occurrences where the precious metals are not confined within any well-defined area. It is in these formations that the work of the geologist becomes of great value, and, taken in connection with the knowledge of the mine manager, presents a combination desirable in the extreme.

It may be possible that the future will develop mining geologists who will also be mine managers, but of this I have grave doubts. The man who confines himself to specializing in geology comes to view minute alterations of rock from the wrong end of the telescope. He is a scientist pure and simple; to him fossils and non-mineral bearing rocks are of quite as much interest as the highest grade of ore. I believe that the most satisfactory results will be attained, not in attempting to educate geologists to the point of mine management, but rather in impressing upon the mine manager the necessity and desirability of calling upon geologists at times for an opinion, and then intelligently passing upon it and determining whether it is feasible from a commercial standpoint.

M. L. REQUA.

San Francisco, January 15, 1906.

AMALGAMATION IN CYANIDE MILLS. — One of the results of the impetus given to fine grinding is the discovery that much greater returns can be obtained on the plates from the slime product. The usual practice is to flow the pulp over ordinary silvered plates, and then, after re-grinding, over shaking plates. But, even without shaking plates, fine recoveries have been shown. Thus Holloway, in Korea, has increased his amalgamation extraction on an ore containing much pyrrhotite by no less than 50%. Denny shows that, while the plus 60 mesh product yields scarcely any result by amalgamation, the plus 100-mesh yields about 57% on the tables; the plus 150-mesh no less than 78%; and the plus 200-mesh an extraction of 83% on the plates only. Caldecott points out a similar experience; namely, that the bulk of the amalgamation extraction on the Robinson Deep is derived from the fine material; indeed, he calculates that both the Robinson Deep and Simmer & Jack recoveries on plates amount to almost exactly 90% of the gold content of the sand passing 90-mesh, assuming the gold on the coarser sand to be untouched.—Alfred James in *Eng. & Min. Journal.*

SAFETY LAMPS.—In a recent test of safety lamps for mines, by the Belgium government, at Frameries, it was definitely settled that there was no more danger of explosion with lamps fed with mineral oil than with those fed with vegetable oil. The lamps fed with light mineral oil gave much better light and gave better opportunity for using automatic re-lighting devices, although these have not yet been perfected so as to be absolutely safe and reliable. The miner had better retire to the surface or to a lighting station before trying to re-light a lamp. Tests with a number of standard lamps showed that there was no danger of explosion from coal dust.

Anderson's Method for Passing a Survey Line Down a Shaft.

Written for the MINING AND SCIENTIFIC PRESS.

This is a survey method invented by a prominent mining engineer who was on the Comstock and at Bodie in the early 'eighties. To do the work there is required:

A coil of fine steel wire (pianoforte wire).

Two heavy weights; for deep shafts, the ordinary cast-iron stamp-heads may be used.

Two 5-gal. cans, partly filled with heavy lubricating oil; for deep shafts, tubs, made from half-barrels, may be employed.

Two drawing-boards (see Fig. 1).

A pocket case of draughting instruments.

Two steel straight-edges.

It is assumed that two points, from which the wires are suspended, have been located at the top of the shaft, marking the line. At the station (to which it is desired to carry the line) suspend the plumb-bob in the oil, moving the can until the weight swings freely; pile the square timbers to support the drawing-board as shown in Fig. 2; pass the weight through the slot and adjust the board so that the wire centers in the opening. Level the board and fasten it to the timbers by gimlet-pointed wood screws.

Place the straight-edges parallel and on either side of the wire in some one of the several positions shown in Fig. 3, as AA and BB; watch the swing of the weight, and gradually move them until in a single oscillation, with conditions apparently normal, the wire touches each straight-edge, and draw the pencil lines AA and BB. Repeat with the straight-edges in the position CC and DD, and draw the lines CC and DD tangents to swing of the bob and at right angles to the first set AA and BB. Determine in the same manner, as many lines, EE and FF, GG and HH, tangent to the curve described by the oscillating wire, as may be required.

Detach the weight from the wire and place in position the centerpiece, fitting tightly the opening. Draw the lines AA, BB, CC, etc., across the plug and with a pair of dividers, find the center X_1, of the oscillation, marking the point with a small tack or pin.

In the same way, determine the position X_2; the center of the curve of oscillation, for the second plumb-bob. A wire stretched over the points X_1X_2 will give the approximate line, and on its prolongation, a station for the transit may be selected. It requires but a few movements, with an instrument provided with a movable head, to set upon the line X_1X_2 prolonged.

Mark the line by fore and back-sights; let the instrument stand; erase the pencil lines on the board with sandpaper; hang the weights upon the wires and make a new determination of the centers of oscillation, X_3 and X_4.

The second approximation of the position and direction of the line should coincide with the first, within the allowable limit of errors. Repeated determinations can be made rapidly if desired. When there is a strong current of air through the shaft, it is advisable to cover the top of the shaft and close the main airways. Frequently the current of air changes in direction at different times in the day or night, and it is well to make independent determinations under the changed conditions.

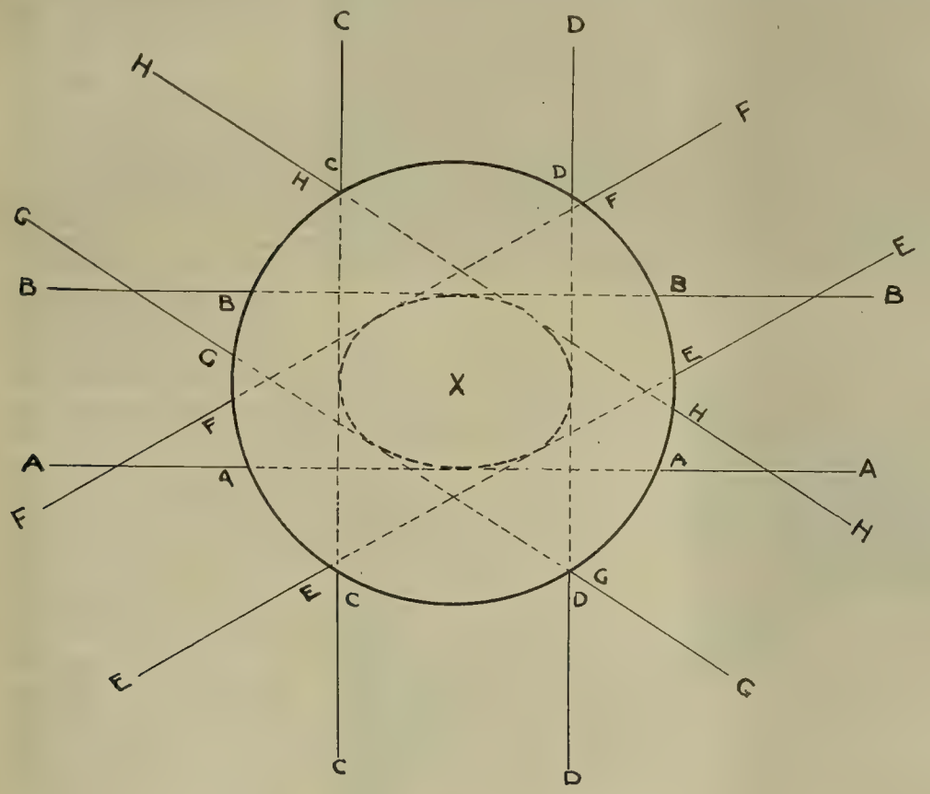

Fig. 3.

The Shay Geared Locomotive.

The most conservative estimate places the number of locomotives operating on the 214,000 miles of American railroads at 500,000; there are also about 125,000 American-built locomotives in operation in other countries.

If the American locomotive is the best of its kind, so also is the Shay geared locomotive the best for the particular classes of work it is meant to do. Direct connected locomotives require certain pre-arranged conditions for their successful operation. They do their best work when everything else is right, but the Shay adapts itself to conditions and can be run to advantage where not only no other type of engine, but the road itself, is well nigh impossible.

The entire locomotive is strongly built, liberal use being made of cast steel in the construction. Its flexibility makes it possible to operate the largest locomotive on curves of 100 ft. radius, while the smallest are sometimes used on curves of 30 ft. By reason of the construction, the weight is widely distributed, and there being no reciprocating or revolving parts directly connected to the driving wheels, there are no 'hammer blows,' so that very light rail can be used. The cylinder arrangement (three at 120°) and the low center of gravity make the locomotive steady, so that it is possible to run safely at a speed of 20 miles an hour. Very heavy grades can be operated, Shay locomotives being in regular operation on grades of 16%. This is due to the large number of impulses (12) per revolution of the driving wheels, which give a torque as regular as an electric motor, whille the direct locomotive, with four impulses, is liable to slip when the high admission pressure is exerted on the pistons. By means of the gearing, the locomotives are given all the tractive power that the adhesion permits.

Shay geared locomotives are at work on almost every road on the American continent where heavy grades have to be contended with, from the Canadian Pacific in British Columbia (where the grades average four per cent) to the Guayaquil & Quito Railway in Ecuador (where the grades run as high as seven per cent). They are to be found on the Pacific Coast, in the pine woods of Michigan, and the mining districts of Idaho; the iron and coal regions of western Pennsylvania, and taking part in the development of the New South bordering on the Gulf of Mexico. This useful engine is made by the Lima Locomotive Works at Lima, Ohio. The firm is celebrated for the splendid specimens of direct connected locomotives which they have produced, but to the mining world they are best known for the Shay type of engine.

The Prospecting and Valuing of Dredging Ground.

Written for the MINING AND SCIENTIFIC PRESS by NORMAN C. STINES.

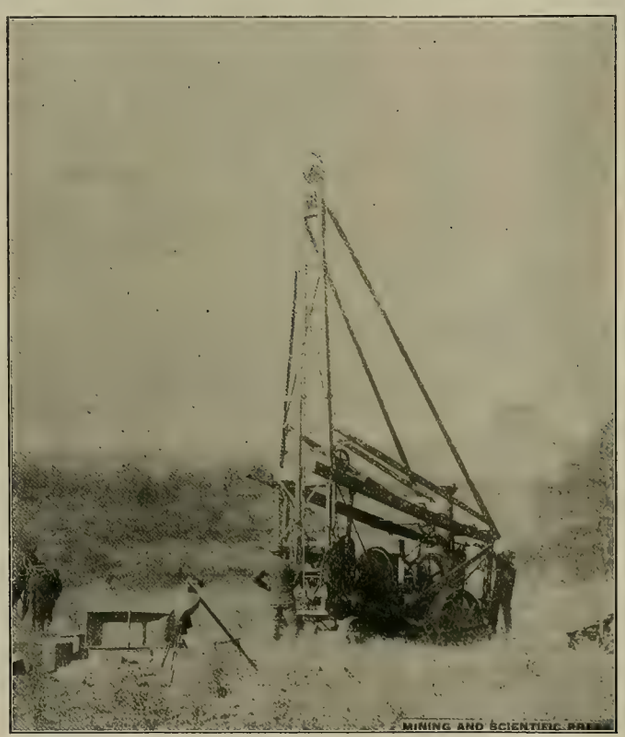
The prospecting of gravel deposits to test their fitness for dredging purposes is done by boring holes with a drilling machine, by sinking shafts, or by making a trial run with what is known as a prospecting dredge. It is such work by means of the Keystone drill that this article attempts to describe.

In prospecting a piece of ground the following data must be ascertained:

1. The average value of the ground per cubic yard and the distribution of the gold.
2. The character of the gravel.
3. The character of the bedrock and its approximate contour.
4. The position of the water level as referred to the surface.
5. The amount of water obtainable for the pond.
6. The nature and cost of the power obtainable.
7. The length of the working season.
8. The cost of the land.

The first four points are determined directly by the use of the drill, and the last four by a careful study of the prevailing conditions. As this paper is to describe the method of using the drill and the interpretation of the results thus obtained, it will treat of the first four points only.

The machine used in the greater part of this work in California is the Keystone Driller No. 3, Traction. It is made by the Keystone Driller Co., Beaver Falls, Pa., and costs complete, f. o. b., at the factory, about $1,630. The driller consists of a walking-beam arrangement operated by a steam engine of 8 h. p. This produces the required motion for raising and dropping the drill, and for transporting it from place to place. The engine, with the drilling cable reel, the sand-reel and the necessary sheaves, is mounted on a four-wheeled truck. The drill, consisting of rope socket, drill-stem and bit, is suspended by a 1¼-in. cable which passes over the rear sheave and over the front one, continuing over the sheave at the top of the derrick and then down. As the walking beams are put in motion, the drill is alternately raised and dropped. The machine makes about 52 strokes per minute in drilling and about 54 in driving.



Moving to a Hole.

Laying Off the Ground.—For the preliminary work, to determine if the gold is scattered over a large area or if it is confined to a narrow winding channel, a few holes are sunk from 500 to 700 ft. apart. If the gold is found to be pretty evenly distributed over the whole tract, it is divided into five or ten-acre squares, according to the amount of drilling to be done. A flag is placed in the center of each of these squares, and this marks the site of the hole.

If the gold is found to be confined to a narrow winding channel the ground is crossed, at right angles to the channel, by series of holes. These series are from 400 to 800 ft. apart. At every 100 ft. in each series a flag is placed and this, as before, marks the place to be drilled. On drilling, the first hole in any series is placed as near the center of the channel as possible, and then drilling to one side or the other is only carried as far as the results warrant. Every fourth or fifth series is drilled across the tract to be sure that there are no splits in the channel. This method insures the least amount of work spent in valueless ground. The series are designated by a letter and the holes by a number. In this way they are recorded in the transit notes. When a hole is drilled, the number in the log-book is also placed in the transit book and the number from the transit book is placed in the log-book.

Operation of Drilling the Hole.—The machine is moved to one of the flags and set up there. A hole is then dug to a couple of feet and the shoe-joint is dropped, then plumbed, and finally the dirt filled around it. The next operation varies according to the nature of the ground. Where the soil is deep, the driving blocks are put on and the casing is driven as far as possible or to the gravel. Where the gravel commences at the surface, the drill is first lowered and the ground immediately beneath the shoe is drilled. The casing generally settles as the drilling proceeds; but if it does not, when a sufficient depth has been drilled, the blocks are put on and the casing driven to a point about three inches below the depth drilled. The lower end of the shoe-joint is protected from injury by a steel shoe, 7½ in. diam., tempered at the cutting edge and slightly beveled on the inside. It is the area of this shoe which represents the area excavated.

The casing is nearly always driven to gravel. If the first joint does not reach, a second, and sometimes a third, is put on. As soon as the first joint has been driven to head, the driving cap is removed, the threads brushed off and greased. The second joint is then put on, cinched tight, the driving cap placed on that and the driving continued. The depth driven at first usually varies from three to twelve feet.

In driving, the stem on which the driving blocks have been placed acts as the weight in a pile-driver. The weight of the stem is about 800 lb. and the drop ranges from 28 to 36 inches.

After the casing has been driven as far as desired, the driving blocks are removed, the stem is lowered into the casing, the core is measured, water is poured in and the walking beams are set in motion. When the machine man measures and reports the length of core to the panner, he also reports the depth of the casing in the ground. The core is measured in the following manner: The length of connected casing is measured on the drill-stem and rope, commencing at the bit. This point is marked in chalk. The stem is then lowered into the hole and the difference between where the top of the casing is and the mark on the stem, is the core. The core then is the material in the casing. This is important and will be fully explained later.

While there is yet some core in the casing, the drill-stem is removed and the sand-pump is placed in the hole. This is a piece of 4-in. pipe about 8 ft. long, in which is a rod or plunger that fits closely the pipe at its lower end, where there is a valve. On raising the plunger suddenly, a vacuum is formed and the material in the hole is forced in through the valve at the bottom. This is repeated until all of the material is thought to be in the pump. The pump is then reeled out of the hole, the contents of which are caught by the panner. The stem is then lowered into the casing, the core is measured, the stem is hoisted, the driving blocks are put on and the casing is driven again.

This is repeated for each foot of the hole until the desired depth has been reached. The desired depth is generally bedrock or the lower limit of a known pay-streak. The depth to which the hole is sunk in bedrock depends upon the occurrence of gold. Some bedrock carries gold for a considerable depth. The hole is generally put down until no colors are found in the pan. It may happen that the casing has come on bedrock in such a way as to cross a seam. This seam may be particularly rich and gold might come into a number of pans after bedrock has been reached. When this occurs, it is well to be wary of the results of that hole, if it gives a yield above the general average. The gold is plainly coming from a seam and so we have no measure of the volume of dirt from which it is coming. There is one way to guard against this danger. When approaching bedrock use two or more small pans for receiving the concentrate from each foot panned. The concentrate for, say, the first 27 ft. is placed in a pan. On driving the 28th foot and panning, there is found to be more gold than usually comes with bedrock. This is then put in a separate small pan, as is each succeeding pan of concentrate; if there seems to be more gold than usual, it is saved separately and the results of the ground above bedrock and that below bedrock are then known. This is not often necessary, but it will save distrust of the high returns, which sometimes appear in a hole among a lot of other lower results, which are fairly close together.

The hole being drilled as far as desired, the drill is placed on the ground, the rope-socket taken from it and placed on the pipe-jars. These pipes or pulling-jars consist of an iron ram or boss on the end of a stem about four feet long. On this stem is a threaded knocking-head with a square opening through which the stem passes, up and down, in striking the blow. The threaded knocking-head is screwed to the casing and the ram is drawn up so that it will strike against the knocking-head when put in motion by the walking-beams. The walking-beams are then set in motion and the jar of the ram against the pipe causes it to be loosened and to be drawn up. As the pipe comes up, the slack is taken by the runner. When the top joint is removed from the ground, the machine is stopped, the threaded knocking-head is removed and the pipe-jars are pulled from the casing. The top joint is then removed and the operation is repeated for each succeeding joint.

When all of the joints are out of the ground, the drill-stem is again put on the rope-socket, loaded into the bed of the machine, the jacks removed from under the machine, the engine thrown into gear for propelling mechanism and the whole is moved to the next flag.

Treatment of Material from the Hole.—The material brought up by the sand-pump may be treated in different ways. It may be caught in a pan held over the sluice-box, the slime going to the sluice-box; it is then washed in the panning tub. It may be caught in the pan, the slime going to the sluice-box as before, then washed in a rocker, the material caught on the apron being panned separately; or it may be dumped into the sluice-box and all of it swept into the rocker, the concentrate being panned.

The second way seems to answer the purpose best. It gives quickest results and is the easiest for the panner. It uses a minimum of water, and at all times the water in the tub is comparatively clear, thereby preventing the loss of gold unavoidable when panning in thick water.

The apparatus required is a sluice-box about eight feet long and 12 in. square in cross-section, a small rocker, pans and panning tub.

Each foot is pumped and panned; the gold is estimated carefully. The amount is then inserted on the log opposite the foot from which it came. This is more fully explained when describing the log-book. The gold is classed in three sizes, 1, 2 and 3. Number 3 is the finest and consists of all pieces which weigh less than one milligram. Number 2 gold would be any piece weighing one milligram or over, up to four milligrams, and Number 1 is such that any piece weighs over four milligrams.

As mentioned above, the concentrate from each washing is put in a small pan and, when the hole is completed, the gold is amalgamated and put by itself. In special cases we would have more than one 'pill,' as explained already. The gold is separated from the mercury by nitric acid and thoroughly washed, dried, annealed and weighed. If the drying is done in the annealing cup there is no danger of loss due to sputtering, but the addition of a few drops of alcohol to the last wash water, when using the porcelain cups, prevents sputtering. From the weight of gold obtained and the volume of dirt from which it came is figured the value of the ground immediately adjacent to the hole.

Not only the gold obtained from the pannings is recorded, but the character of the gravels. This would include a note on the size of particles and whether there was sand, clay or cementing material present. This is ascertained by a close examination of the screenings, as left in the hopper of the rocker. Then, too, the panner carefully notices his concentrate and records anything of interest, such as the amount of black sand, any gem stones, and the appearance of amalgam. These are all recorded in the log-book, opposite the foot in which they were found.

(To be continued.)

ON THE RAND.—In November, 1905, the latest period for which accurate figures are available, the gold mines of the Transvaal produced 424,757 fine ounces of gold from the milling of 1,012,625 tons. The average yield was 35.06s., or $8.41 per ton. The average duty per stamp was 5.05 tons. There were 47,218 Chinese and 80,954 Kaffirs employed at the mines at the end of December.

IF the elements were not eternal in the past, we must ask whether there is reason to believe that they will be eternal in the future. Now although the conception of the decay of an element and its spontaneous transmutation into another element would have seemed absolutely repugnant to the chemist until recently, yet analogy with other moving systems seems to suggest that the elements are not eternal.

Filter-Press Practice in Western Australia.

Written for the MINING AND SCIENTIFIC PRESS by A. B. WALLACE.

When the mine operators in Western Australia turned their attention to the treatment of the gold-bearing slime, they had a choice of one of two methods, namely, decantation and filter-pressing. The serious difficulty was, and is, the scarcity and cost of water. At most mines at that time the water used for milling was the salt water which was pumped out of the mines or from wells. For boiler purposes, this water had to be distilled and cost from $1.25 to $2.50 per hundred gallons. At the present time, however, Kalgoorlie is amply supplied with fresh water by the 'Coolgardie Water Scheme,' as it is called, which supplies about 5,000,000 gal. per day. This water is pumped through a 30-in. main from the Swan river, a distance of 300 miles, and is sold for about 50c. per thousand gallons, meter measure. But in other districts beyond Kalgoorlie, as, for instance, at Menzies, many mines have had to pay as high as $5 per thousand gallons of salt water. For this reason, decantation methods, which involved the loss of, on an average, from 300 to 500 gal., or one or two tons of water per ton of dry slime treated, proved too costly, and, in those localities, filter-pressing was almost universally adopted as the only possible method of slime treatment.

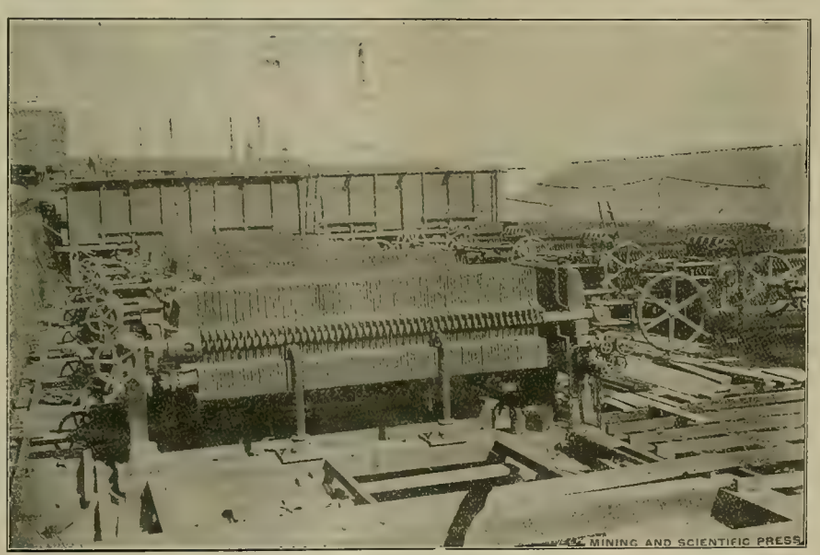
Kalgoorlie in 1897.

The Dehne press or one of similar type is almost universally used. The presses are supplied with feed and wash channels through lugs attached to, but out side of, the frame. At first it was the practice to collect the water from the mill after separating the sand and allow the slime to settle, drawing off the clear water to be returned to the mill. The slimy pulp, in the proportion of about three of water to one of slime, was then forced into the press by means of compressed air. As soon as the press was full the slime was treated for about four hours by pumping cyanide solution through it. In some cases compressed air also was used to dry the pulp; this method, however, took too much press capacity and was finally abandoned.

The method now used is to collect the slime from the mill and agitate it in a vat with mechanical stirrers, with the requisite cyanide solution, in the proportion of two solution to one slime, until all the gold which can be got into solution is dissolved and then filter-pressed, using the filter-press as a separating machine only.

The presses usually have had a capacity of from three to five tons of dry slime per charge; the thickness of the cakes varies, according to the material, from one inch thick to as much as three inches. The thicker the cake, of course, the more economical the treatment. The size of the cake is usually 40 in. square, there being from 30 to 50 cakes in each press. The filter-cloth is material specially woven for that purpose and costs about 50c. per yard at wholesale, so that each cloth costs about $1.25, and it has a life of from 30 to 90 days. If the material pressed contains much sand, the cloth is liable to get cut much quicker. One of the advantages of filter-pressing is the large proportion of dissolved gold and silver which can be recovered. When the pulp is pumped or forced into the press, practically 70% of the solution is recovered at once, then a weak wash or water is forced through the cakes. This washing is very thorough, as the water passes horizontally through the slime from one filter-plate to the other, only about two tons of water being necessary to wash one charge of three and one-half tons of slime. Compressed air is then introduced under about 90 lb. pressure, which forces out more of the remaining water so that the slime, when the treatment is completed, carries only a comparatively small proportion of moisture. That percentage of moisture varies. At the Lady Stenton mine, at Menzies, we often had a residue containing as little as from 11 to 15% moisture, but I consider that the average all over the country would be about 21 per cent.

Regarding the cost of treatment, this varies so largely in different districts that it is practically impossible to give an accurate average. In Western Australia it may be said to vary from $1.50 to nearly $4 per ton of slime, depending on the nature of the material, on local conditions and on the time occupied by one complete cycle of operations. The last is an important factor, and it may be of interest to give a few figures. First, with reference to the labor necessary. It requires two men to discharge a press independent of the 'truckers,' who convey the residue to the dump. These two men can usually discharge a press, clean the frames and close the press ready for another charge in from 30 to 45 minutes. As a rule two men are employed for each pair of presses, discharging and cleaning one while the other is being filled and dried. In some mills, where it takes longer to perform a cycle of operations, two men can handle three presses. On large plants, the shift-boss attends to the filling and washing, but on smaller ones this is also done by the pressmen, who receive about $2.80 per shift of eight hours. The time occupied in filling a press depends on the material and on the pressure used. As a rule, the pulp is forced under a pressure of from 60 to 100 lb. per sq. in. and the press is filled in from 20 to 30 minutes. Wash-water is then used for from 15 to 25 minutes, and generally compressed air to dry the slime is admitted for about 10 minutes; the full cycle of operations, including the discharging and cleaning, being completed in about two hours. Thus, at Menzies, two men, using two presses, handle seven charges in an eight-hour shift, or about 27 short tons of dry slime.



Filter-Presses at Lake View Consols Mine.

The heavy labor cost is due chiefly to the difficulty of getting rid of the residues; these are taken away in cars and frequently have to be hauled some distance over the flat site on which the mill is necessarily erected in a flat desert country. Power is also an expensive item when fuel costs from $6 to $7.50 per cord, and water for boilers has to be distilled or bought. On the other hand, the method could be used economically in a district where there was a plentiful supply of water, as the residues could be sluiced away and water could be used to supply power both for agitation and for compressing air.

Of late it has been the custom to use pumps for filling the presses instead of compressed air, as being cheaper, but when this is done, a large air-chamber must be added to produce as steady a pressure as possible.

The Diehl process, which involves the sliming of all the ore, has been employed with great success at some of the large properties. This described briefly is as follows: The ore, after crushing and amalgamating, is sized, the fine slime going direct to the agitation vats, and the coarse sand going to flint or tube-mills for re-grinding. The product from these is again sized and the coarse material returned, the fine going, as before, to the agitation vats, which only receive the ore after it is ground to slime. It is then agitated with cyanide solution for a period varying from 16 to 24 hours, then a solution of bromo-cyanide is added and the agitation continued for a further period, after which the whole is filter-pressed. This method, on the whole, has been highly successful in Western Australia and owing to the peculiar local conditions, was the only one possible. In many cases, slime has been treated which had accumulated in the settling dams. This is taken in cars to a 'mixer,' in which the slime is thoroughly broken up in cyanide solution, after which the treatment, of course, is the same as previously described.

THE BORAX INDUSTRY.—Almost the entire production of borax in the United States continues to come from California—from San Bernardino, Ventura and Inyo counties—although surface deposits in Nevada, near the California line, now produce a small quantity. The colemanite deposits in San Bernardino county, Cal., are the largest producers, and the deposit owned by the Borax Consolidated Company, Ltd. (Pacific Coast Borax Company), is the greatest of these. The American Borax Company, in San Bernardino county, is the second producer in importance. This company is working a low-grade borate of lime, from which boric acid is produced by a special process. The Western Mining Company, which began operations near the end of 1905, is working the same class of material. The Palm Borate Company also owns properties in the neighborhood of Daggett. In Ventura county the Frazier Borate Company is mining material which is shipped to San Francisco and refined by the Stauffer Chemical Company. The Columbus Borax Company is also operating a deposit in the same county. Near Big Pine, Inyo county, the Western Borax Company is working marsh dirt or mud that carries from 8 to 10% of borax. The output of Inyo county is limited by reason of the difficulties of transport and the scarcity of white labor. Along the Mohave desert and the Death Valley region of California are numerous small deposits of low-grade borax, which will doubtless be utilized in the future. There are several places in Nevada where the 'cotton ball' surface deposits are being worked; this is a venture that would have been wholly profitless before the increase of the tariff on borax. Near Winnemucca, Nev., there are two surface deposits of earth overlying old marshes and carrying about 15% of borax, which are worked during the summer. The bulk of the borax of this country comes from the colemanite mine of the Pacific Coast Borax Company at Borate, San Bernardino county. All the ore that averages 35% or more is shipped East directly, but the lower grades are first concentrated at Marion. This company is now manufacturing at its Eastern refinery several new products, such as borax soap, talcum powder, bath powder, etc., which, having been well advertised, are popular and have caused an increased consumption of borax in the household. The Pacific Coast Borax Company also owns certain borax properties in Nevada, including Teels' Marsh, where Mr. F. M. Smith, president of the company, first discovered borax. This particular deposit is now nearly worked out. Among other properties owned by the company are several in and around Death Valley, which have not yet been worked.—Charles G. Yale in *Mineral Resources*.

Cyanidation of Concentrate.

Written for the MINING AND SCIENTIFIC PRESS by FRANCIS J. HOBSON.

It is generally held that gold as it exists in concentrates, is soluble in potassium cyanide, and the adaptability of the cyanide process depends entirely upon the physical characteristics of the concentrate to be treated, the relative association of the crystalline particles; provided, there are no base metals present to cause an excessive consumption of cyanide and consequent fouling of solutions.

In the case of silver, the question arises as to the solubility of the various natural occurrences of the metal as well as the physical and chemical characteristics of the concentrate.

The chief minerals of silver are: The native metal and the sulphide, argentite; four species among the sulph-arsenites and sulph-antimonites, namely, proustite, or ruby silver; pyrargyrite, dark red silver; freieslebenite, antimonial silver-lead sulphide; stephanite or brittle silver; the bromide and chlorobromide, bromyrite and embolite. Argentiferous tetrahedrite contains sometimes as high as 30 per cent silver as argentite; there is also argentiferous galenite and blende containing silver as sulphide.

The first mentioned, native silver, is so slowly soluble in cyanide that from it practically no extraction can be obtained. Argentite is readily soluble, likewise the chloride, bromide and chloro-bromide. Ruby silver, stephanite, and freieslebenite, are sparingly soluble in cyanide solutions, but they are readily soluble in a solution of mercurous potassic cyanide. The extraction of silver by cyanide from argentiferous galenite, is a problem yet to be solved.

Taking these facts as a basis, in the absence of chemical interference, silver can be extracted from concentrates where it exists in soluble form, if the physical structure permits of solution-contact with the contained argentiferous compound. I have proved in the case of concentrates from Veta Madre ore, that the physical structure will permit contact sufficient for the extraction of both silver and gold without the fouling of solutions. I leached 100 lb. of concentrate obtained from ore crushed by stamps to pass a 30-mesh screen. This material was treated continuously for 90 days with 0.3 per cent KCy solution. An extraction of 89 per cent of the silver and 97 per cent of the gold was obtained, an extraction of 91.5 per cent of the total value. The metals were precipitated on zinc shaving in a porcelain zinc-box; the clean-up checked with the extractions called for by assay; all of the zinc was reduced with acid.

One hundred pounds of concentrate, re-ground to pass a 100-mesh screen, were treated by agitation in a revolving barrel with a 0.3 per cent cyanide solution, for eight days, decanting and renewing solution daily. The extraction obtained was 93.5 per cent of the silver and 96 of the gold. I believe that 30 days' leaching of the re-ground concentrate would have given an equally good result. The cyanide consumption in both tests was seven kilograms per ton. The concentrate was low grade, assaying about four kilograms silver and 30 grams gold per metric ton.

I am now running a test in my laboratory on a 100-kilo. charge of concentrate, assaying 26.5 kilo. silver and 130 grams gold. Silver exists in the concentrate chiefly as argentite. It is being leached with 0.7 per cent solution. So far it does not show an excessive consumption of cyanide, and after seven days' leaching the extraction of silver was about 20 per cent. After leaching for six weeks, the extraction is 53 per cent of the silver and 80 per cent of the gold. Leaching is still going on. Comparing this result with that obtained in the same time in the 90 days' leach, I expect a like extraction with three months' leaching. At first this may seem to be an exceedingly long time of treatment, but when you consider that from ores in this camp, less than one per cent of concentrate by weight of ore is obtained, a small addition to our cyanide mills will take care of our concentrate output. In the case of the Guanajuato Mines & Reduction Company's plant, we are erecting sand-vats each of 350-tons capacity. Two additional vats will handle concentrate, although it will doubtless be better to put in three vats one half the size of our sand-vats. This will allow for six weeks' collecting of concentrate and three months' leaching. The sand mill-solution can be used for this purpose without interference with sand treatment. The precipitation can take place in the sand-solution zinc-boxes.

I am of the opinion that concentrate from other ores of the Guanajuato district will be less amenable to cyanide treatment than those from the Veta Madre, as considerable value is carried in arsenopyrite whose molecular structure is more compact than that of the pyrite; consequently, if the extraction can be obtained, it will be by longer contact, as a more compact structure will necessarily cause slower diffusion of solution.

The best method of treating our concentrates is likely to be by leaching with cyanide solution for periods of from 30 to 180 days, followed by chloridizing roast and further leaching with cyanide. The objection will be made that returns of bullion from the concentrate-leaching will be greatly delayed, but it will not be as long as the length of treatment suggests, because the larger part of the extraction will be obtained in the earlier period of leaching, and this bullion will be recovered as it is extracted, in the regular clean-up.

Hoist Underground.

On the page opposite we give a drawing of the arrangement of hoist, ore-bins and station at the main, or Principe, shaft of the Sirena mine, which is the property of the Guanajuato Consolidated Mining & Milling Company, at Guanajuato, Mexico. The plant includes a crusher, into which the ore passes, after preliminary sizing over grizzlies. There are separate bins for the coarse and the fine; also pockets for the waste rock, which is used as filling for old stopes. The ore is hoisted in skips running on an incline of 45°. We owe this drawing to the courtesy of the manager, Mr. M. E. MacDonald.

Cantilever Over the Zambesi.

The large cantilever bridge over the Zambesi river near the great Victoria Falls, in Africa, forms a part of the permanent way of the Cape-to-Cairo Railway, which is to connect Egypt with South Africa. At the point where the bridge crosses the Zambesi river is a gorge 420 ft. high. and the bridge crosses the top of the gorge almost on a level with the top of the Victoria Falls. Communication between the two banks of the gorge was first established by means of a line rocket fired from one bank to the other, and by drawing over ropes of gradually increasing sizes. The two sides were eventually connected by means of a cable 2.7 in. thick, and upon this a Blondin transporter was operated. This transporter was able to carry a load of 10 tons, and within a few weeks over 1,000 tons of material for the bridge and roadway, as well as locomotives and trucks, in pieces, were conveyed across the gorge. The bridge had to be erected on the cantilever principle, each side being made self-supporting, and the two sides gradually approached each other until they were finally connected at the center. The total length of the bridge is 650 ft., of which the central span includes 500 ft. This central span is made of 20 bays, each 25 ft. long. It will be seen from this that, during its erection, there was an overhang on each side of 250 ft. before the bridge could be connected. To counteract this weight of several hundred tons on the overhanging ends, a cable was made fast to each of the unfinished sections, and was carried upward to the shore ends, where it was anchored to the bank. All the riveting, lighting, and transporting were done by electricity. During a considerable portion of the year the bridge is surrounded by a cloud of mist from the falls, and this makes its protection from rust a problem of great importance. During the erection of the bridge every piece was carefully inspected, all signs of rust were removed, and a special coating of waterproof paint was used. The finishing coat of the bridge will be of a dull gray enamel. —*Technical World.*

SPECULATION AND PROSPERITY.—Prof. Bryce, who looks indulgently at what are sometimes called the foibles of Americans, regards their habit of rushing into wild speculation as only one phase of their abundant belief in the country's future. Just how much of it is really this, and how much the attribute of character which makes our men the first poker-players, and our women the foremost bridge experts in the world, would perhaps be difficult to say. But they certainly delight in the one for its own sake as they do in the other; the difference being that the argument of a 'discounted future' gives a sort of moral status to speculation for the rise on a narrow margin, and stamps the unbeliever in the market as a doubter of his own country's greatness. And, after all, whatever our feeling may be about Wall Street's way of voicing its sentiments, it is a notable picture of robust prosperity which the country spreads before us. Certainly, not since 1900 has there been a season when the era of good times existed visibly in every city and village of the United States as it exists today. This prosperity is real as it was not, in such familiar 'boom times' as 1872 and 1856, when the excitement of the markets had its origin in the paper-money manufactories rather than in the products of the earth. It is this fact which leads to the comfortable belief that prosperity will last for a good while after the speculation which professes to 'discount' it has tampered with the money market and met its inevitable collapse.—*Evening Post*, New York.

Now is the time to engage contractors to dismantle old mills at low cost. This work should be in great demand, as a report is going the rounds of the daily press to the effect that certain contractors who were dismantling an old mill near Albuquerque, New Mexico, discovered a $200,000 gold brick under the floor. Newspapers often sell gold bricks.

Air Compressors at the Champion Copper Mine, Michigan.

Among the 22 productive mines of the Lake Superior region the Champion ranked fifth in production in 1905, being credited with an output of 16,750,000 lb. refined copper, the sale of which yielded dividends of $1,500,000. The mine is at Painesdale, Michigan, and is one of the properties operated by the Copper Range Consolidated Copper Company. Under average conditions its output is about 2,000 tons of ore per day, which is hoisted through four shafts.

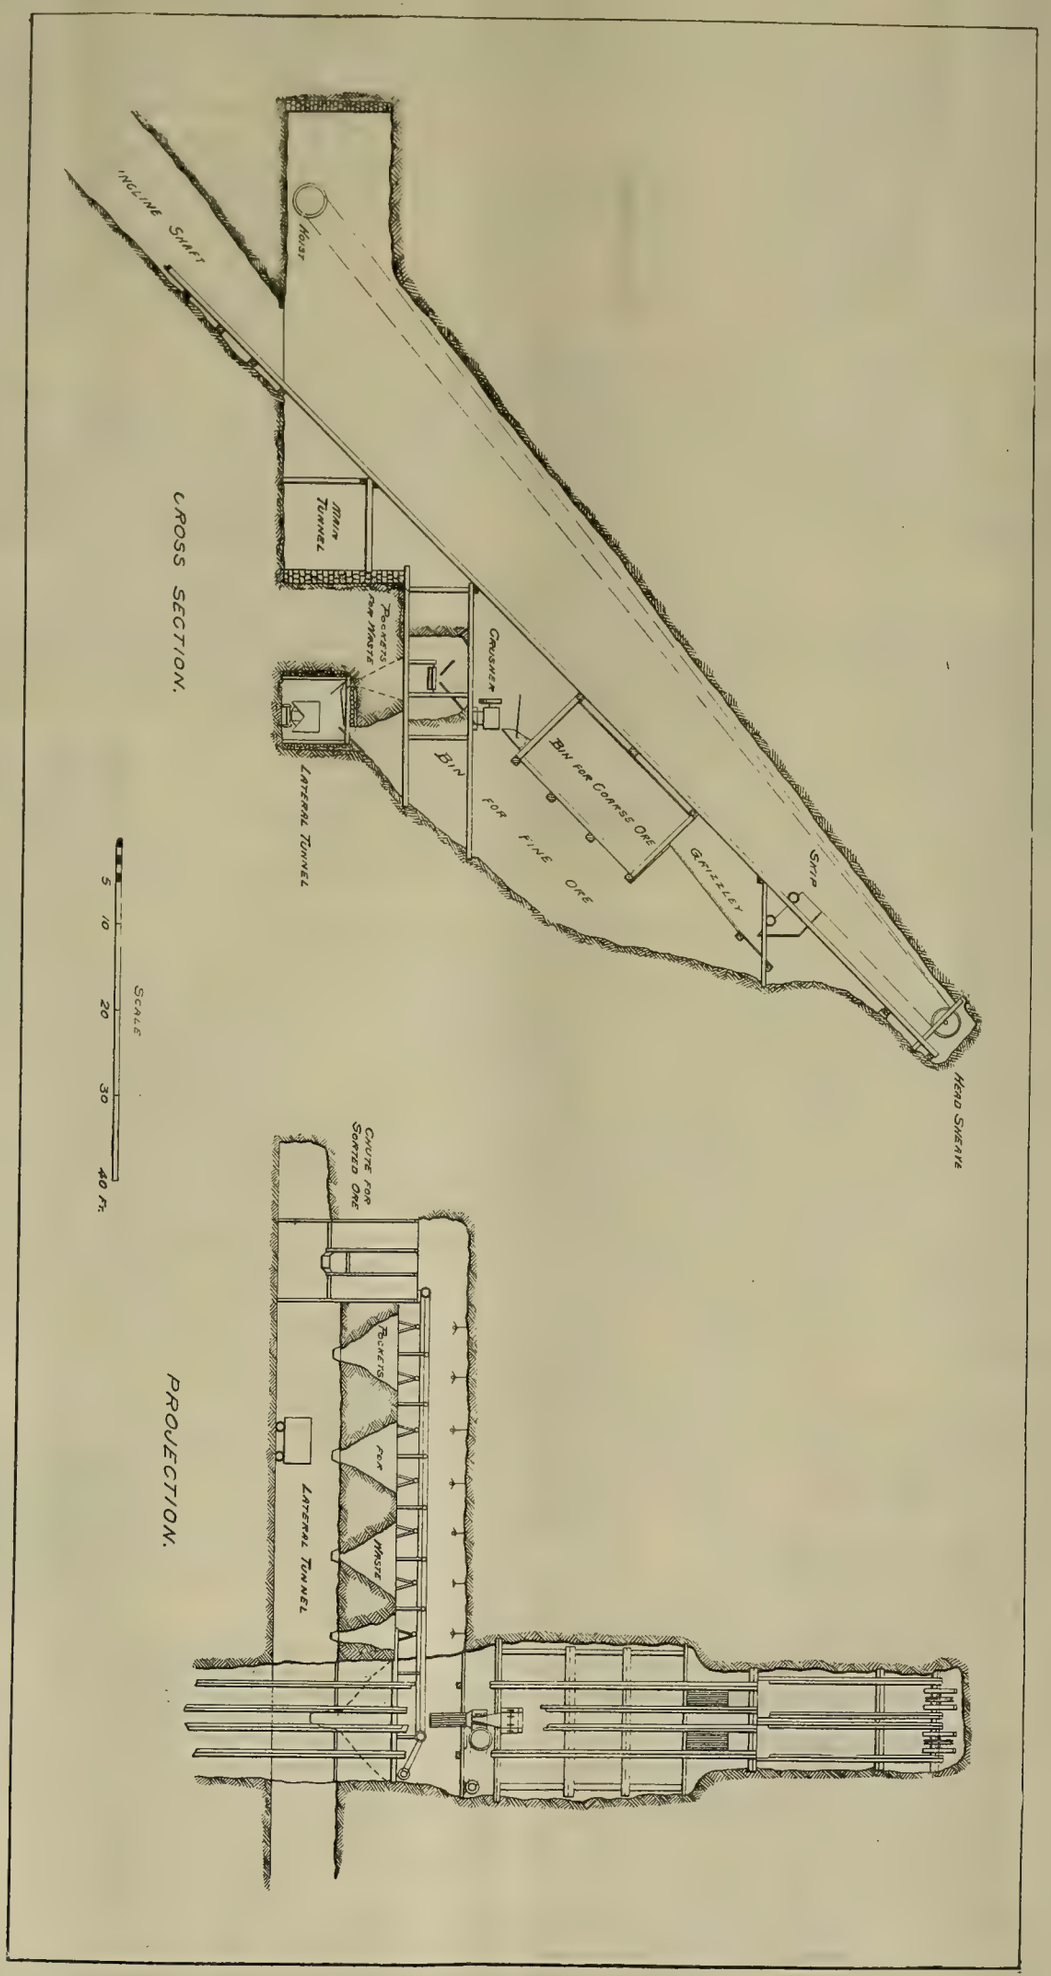
The best machinery is to be found at the Michigan copper mines, and the Champion is no exception. It has one of the largest compressors in the district. This was built by the Ingersoll-Sergeant Company, of New York. It is a duplex Corliss type, with cross-compound condensing steam cylinders and two-stage air cylinders. Steam is supplied at 130-lb. pressure by a battery of high-pressure boilers in an adjacent boiler-house. The steam pipe enters the basement of the compressor-house and rises through the engine-room floor to the high-pressure steam-cylinder with a wide sweep bend of 6-in. pipe. The exhaust passes to a Worthington condenser placed, with its pumps, in the basement below. A 20-in. vacuum is maintained. The steam valve-gear is of standard Corliss release type. Automatic regulation is secured by an improved governor, in which the usual fly-balls are supplemented by a governor cylinder, through which receiver air-pressure operates to vary the cut-off on both cylinders, adjusting the speed to the demand for air and maintaining air-pressure constant. Main frames are of standard heavy-duty Tangye pattern, and cranks are of balanced disk type.

High and low pressure air-cylinders are completely water-jacketed on heads and barrels. Cold air is drawn from outside the building through a duct terminating in an intake bracket supported on the compressor foundation. The Sergeant piston-inlet valve handles the intake on both high and low pressure cylinders. Direct-lift discharge valves are used. A vertical receiver-intercooler stands between the cylinders, 48 in. diam. and 13½ ft. high, with tinned brass tubes, through which the cooling water circulates. Steam-cylinders are 18 and 36 in. diam.; air-cylinders 20¾ and 32¼ in. The stroke is 48 in. Normal speed is 72 r.p.m., at which the free-air capacity of the compressor is 3,100 cu. ft. per minute. Air-pressure is 80 pounds.

The compressor building is an iron-covered, steel-framed structure, lined with sheathing and floored with matched wood. A solid concrete foundation, capped with finished stone, supports the compressor. In a separate building close at hand is another Ingersoll-Sergeant air compressor—a survivor from early days. At one time this small machine furnished all the air required for rock-drills; today it is maintained as an auxiliary to the larger compressor. It is a straight-line type, steam-driven, with simple steam and air cylinders 18 and 18¼ in. diam., respectively, and a stroke of 24 in. At the rated speed of 94 r.p.m. its free-air capacity is 656 cu. ft. per minute, delivered at 80-lb. pressure. The steam end is fitted with adjustable cut-off valves of Meyer type, and Sergeant piston-inlet and direct-lift discharge valves handle admission and discharge of the air.

There was a period of two years in the history of the Champion mine when rapid development threw an unusually heavy load on these two compressors, the Corliss and straight-line. During this time these machines ran continuously, carrying jointly an average load of 56 rock-drills, 7 pumps and 4 small hoists used for light work. Throughout all this heavy overload there were no breakages and no repairs on the compressors, nor any delay directly chargeable to these machines. They came through the ordeal in splendid condition. Now that conditions are somewhat relieved, the larger compressor easily does the work of its part of the mine, while its smaller associate stands ready for emergencies.

MAGNETIC WELLS.—The term 'magnetic wells' has been applied to wells whose casings attract and hold iron objects. In the study of underground waters much interesting information concerning these magnetic wells has been obtained by members of the United States Geological Survey. Usually only small objects, such as nails, are attracted by the casings, but occasionally a well is found in which the magnetism is sufficient to hold hammers or wrenches. The water in the wells is sometimes reported to be magnetic. To make a test for magnetism in water, a glass vessel (a metal vessel will not answer) should be filled at the well and carried to a distance of about 100 paces from the well, where it should be at least equally remote from any mass of iron. A piece of steel, such as a pocket knife, should then be carefully tested with some common needles for magnetism. If the steel is not magnetized it should then be placed immediately in the water in the glass vessel and allowed to remain there for five minutes, after which it should be wiped dry and again tested.



ARRANGEMENT FOR HOISTING UNDERGROUND IN THE SIRENA MINE, OF THE GUANAJUATO CONSOLIDATED MINING & MILLING COMPANY.

The Separation of Iron From Zinc by Ammonia.

Written for the MINING AND SCIENTIFIC PRESS by KURT PIETRUSKY.

The ordinary method of separating iron from zinc, manganese, nickel and cobalt usually employed for qualitative analyses consists in treating a ferri-solution with ammonia. This method, in its simple form, does not give satisfactory results for quantitative analyses, as the precipitate will always contain a certain amount of the other metals present. Thus, Fraatz has found that, if the ferri-solution contains more zinc than iron, a quantity of zinc amounting to about one-fifth of the weight of the iron present will remain, and this cannot be washed out of the precipitate.

Ibbotson and Brearley employed the same method for separating iron from nickel, but obtained in the filtrate of a single precipitation only from 3 to 30% of the total amount of nickel, the quantity depending upon the excess of ammonia in the solution. By addition of large amounts of ammonia and chloride of ammonium, they succeeded in affecting a complete separation, but this procedure is hardly advisable for practical analytical work. The only way of using the ammonia method in regard to zinc and nickel would be to repeat the operations, that is, dissolving the iron hydroxide precipitate and precipitating the iron until the ammoniacal filtrate contains no other metal but iron.

For the separation of iron from cobalt and especially from manganese, the ammonia method is hardly ever used on account of the highly oxidizable character of the protoxides of the metals. The only way to use the ammonia method in a practical way seems to consist in the separation of iron from zinc after the assay method of Schaffner and Galletti.

In order to finally settle the question whether a complete separation of iron from zinc is possible by precipitation with ammonia and ammonium chloride in a single operation, and, if so, under what conditions this result can be accomplished, W. Funk has recently made a number of interesting tests in the laboratory of the Royal Mining Academy at Freiberg in Saxony which had been suggested to him by Professor O. Brunck of that institution. He reports on the results of his investigation in the *Zeitschrift für Angewandte Chemie*, as follows:

The test solutions contained zinc chloride and iron chloride respectively. The former ore was obtained by dissolving electrolytic zinc in an insufficient amount of hydrochloric acid and filtering the residue; 1 c.c. of the solution contained 0.005212 gram of zinc. The ferri-solution was obtained by dissolving electrolytically separated iron in hydrochloric acid and oxidizing the protochloride solution; 1 c.c. contained 0.004056 gram of iron. The contents in each case were determined by gravimetric analysis.

Measured volumes of these metallic solutions were placed in a vessel and diluted to various degrees of strength, whereupon various quantities of ammonium chloride and ammonia of 10% strength were added. The mixtures were heated between 70 and 80° C., and filtered. The precipitate was washed with hot water, either pure or containing ammonium chloride, and dissolved in a little hydrochloric acid, whereupon the iron was once more precipitated, washed and dissolved. The zinc remaining in the iron hydroxide after the second precipitation, was precipitated by treating it with hydrogen di-sulphide in a formic acid solution, and determined by weight as sulphide of zinc.

The first two tests gave the following results:

1. Applied: 208.4 mg. zinc, 60.8 mg. iron; added, one gram ammonium chloride and 3 c.c. of ammonia (of 10%); total volume, 155 c.c. The determination of zinc in the precipitated iron hydroxide yielded 69.2 mg. zinc sulphide, which is equal to 46.4 mg. zinc or 22.3% of the amount applied.

2. Applied: 208.4 mg. zinc, 202.9 mg. iron; added, two grams ammonium chloride and 5 c.c. ammonia; total volume, 260 c.c.; contents of iron hydroxide: 182.2 mg. zinc sulphide, equal to 122.3 mg. zinc or 58.7% of the amount applied.

These results show that it is impossible, even by double precipitation and addition of sufficient amounts of ammonium chloride, to achieve complete separation, if the precipitation is carried out with only a small excess of ammonia.

In the succeeding tests the amount of ammonia added was, therefore, increased, and at the same time other conditions were changed. For tests No. 3 and 4 pure hot water was used for washing the precipitate, while for test No. 5, 6 and 7 a 1% solution and for the other tests a 5% solution of ammonium chloride was applied for this purpose. The results are given in the table at the top of the next column:

The conclusions to be drawn from these figures are: Iron may be separated from zinc by double precipitation with ammonia. A satisfactory result, however, can be obtained only if there is a large excess of ammonia in the solution. Beside, the presence of ammonium chloride is necessary; this salt has to be added also to the wash water, the quantity required amounting to about 5%. The filtrates of tests No. 3 and 4 where the washing was done with pure water

Test Number.	Applied.		Added.		Total Volume c.c.	Contents of the Precipitate, $Fe(OH)_3$.		
	Zn, milligrams	Fe, milligrams	NH_4Cl, grams	NH_3, c.c.		ZnS, milligrams	Zn, milligrams	Per Cent of applied Zn
3	261.6	81.1	0.3	25	245	30.0	20.1	7.7
4	156.3	81.1	0.8	20	85	7.1	4 8	3 1

10	260 6	81.1	3	30	245	0 3	0.2	0.1
11	260.6	40.6	1	30	125	0.6	0.4	0.2
12	208.4	81.1	2	30	125	0 3	0.2	0.1
13	104.2	162.2	1	25	105	0.2	0.1	0.1
14	104.2	202.8	1	30	175	0.3	0.2	0.2

became even turbid when the washing was continued for some time, notwithstanding the large excess of ammonia present on account of the formation of zinc hydroxide. Dilution exercises hardly any influence, as shown by tests No. 6, 7 and 8, and will consequently not be practiced to any further degree than is necessary for the settling of the iron precipitate. The method, when carried out in this manner, will yield accurate results up to 0.1 to 0.2%, even in presence of larger amounts of iron than of zinc. However, in contradiction to the statements made by Pattinson and Redpath, even then traces of zinc could be always found in the iron precipitate.

As indicated by these results, the separation of zinc from iron by ammonia is to be done in the following manner: The slightly sour solution, not unnecessarily dilute, which contains the iron as a ferri-salt, is placed in a bowl. Ammonium chloride and ammonia are added till neutral reaction takes place, when more ammonia is added, until the iron is precipitated. Thereupon an excessive quantity of ammonia is added, the amount varying between 20 and 30 times that required for precipitating the iron and depending upon the quantity of zinc present. The mixture is heated between 70 and 80° C., filtered, and washed with a 5% solution of ammonium chloride. The precipitate is dissolved in diluted hot hydrochloric acid, and the operation is repeated in the same manner.

The zinc contained in the filtrate may be determined by volumetric analysis in the usual manner. The method is, therefore, simple and suitable for technical purposes. If it is desired to determine the iron at the same time, the precipitated iron hydroxide has to be liberated of the ammonium chloride by washing with pure water before the heating and weighing can be done. Considering the large excess of ammonia used for precipitating the iron, it may, however, reasonably be expected that the iron hydroxide will contain determinable quantities of silicic acid. The following tests show that the determination of this acid should not be omitted.

Measured volumes of a solution of iron chloride were treated the same way as above. The iron hydroxide obtained by double precipitation was heated and weighed, whereupon the iron oxide was reduced by continued heating in a current of hydrogen gas, the metallic iron was dissolved, and the residue, consisting of silicic acid, was filtered and weighed; then, in order to exclude error, it was evaporated with a little hydrofluoric acid and two drops of sulphuric acid; the small residue obtained therefrom was deducted. The results of the two tests were as follows:

Test No. 1: 10 c.c. of a solution of iron chloride ($FeCl_3$) equal to 58 mg. ferric oxide (Fe_2O_3) were precipitated with 20 c.c. ammonia; found: 60.1 mg. Fe_2O_3 containing 1.7 mg. silicic acid (SiO_2) equal to 2.9% of the quantity of Fe_2O_3 applied.

Test No. 2: 50 c.c. of a solution of $FeCl_3$ equal to 289.9 mg. of Fe_2O_3 were precipitated by 30 c.c. ammonia; found: 292.9 mg. of Fe_2O_3 containing 2.6 mg. SiO_2 equal to 0.8% of the quantity of Fe_2O_3 applied.

This shows that the silicic acid contained in the weighed iron oxide should not be neglected, and that the quantity of the acid present is dependent upon the amount of ammonia applied.

The results of the investigation justify Funk in stating that the separation of iron from zinc by ammonia is adapted for the volumetric estimation of zinc after the methods of Schaffner or Galletti. It is, however, not advisable to use it for gravimetric analyses, firstly, because the determination of the silicic acid contained in the iron precipitate renders the estimation of this metal more tedious, and furthermore, because the filtrate, on account of the addition of ammonium chloride and washing with water mixed with this salt, will contain considerable amounts of ammonium salts, by which the determination of the metals remaining in the filtrate will be made more difficult.

Mr. Funk concludes his report by saying that also in other respects the separation of iron from zinc by ammonia offers no advantages compared with the acetate method which, when carried out correctly, will yield accurate results in a single operation. As the opinions in regard to accuracy and suitability of this method, as well as the instructions given for using it, differ greatly, Mr. Funk has made also this process the object of a special investigation on the results of which he intends to report later.

THE PROSPECTOR.

The rock and mineral samples from Dulzura, San Diego county, Cal., are: No. 1 is quartz-porphyry, though the quartz blebs are not numerous; the rock contains very finely disseminated pyrite and mispickel (arsenical iron sulphide), and probably will assay in gold. No. 2 is quartz, with micaceous iron. No. 3 consists chiefly of an aggregate of grains of quartz and feldspar, with a few small crystals of pink tourmaline (rubellite); the bright crystals with radiated structure are sillimanite, a composition of silica and alumina. No. 4 is tourmaline. No. 5 is quartz.

The rock samples from Goldfield, Nev., are classified as follows: No. 36, rhyolite. No. 37, a granitic rock in which quartz and feldspars are prominent, and mica or hornblende scarce. No. 38 is andesite. No. 39, mica schist. No. 40 is the same as 37. No. 41 is rhyolite tuff. No. 42 is basalt. No. 43 consists almost wholly of feldspar matrix, with a few small lath-like crystals of plagioclase; it may be called feldspar-porphyry; it contains pyrite, also, in finely disseminated crystals.

The rocks and ores from Dillon, Mont., are as follows: No. 1, magnetite in quartz. No. 2, the yellowish green mineral is clinochlore, a silicate of magnesia, alumina and iron; clinochlore is supposed to be generally the result of decomposition of biotite. No. 3 is wad, an impure mixture of manganese and iron oxide with clay or other earthy mineral. No. 4 is volcanic ash.

The rock sample from Princeton, B. C., marked W. C. M., is a very much kaolinized eruptive rock, the exact nature of which cannot be determined because so much altered.

RADIUM is a metal, extremely like barium, except that its atomic weight is about the sum of those of barium and of strontium, and except that the average life of an atom of radium is only about 2,000 years. It casts off helium, and what is left is a chemically inert gas, somewhat like xenon. The average life of the atom of radium emanation is only five days. It decomposes, and its principal constituent, called Radium A, is left as a deposit on the surface of the vessel. The average life of the atom of Radium A is only 4½ minutes. It is converted by throwing off helium or something like that into a somewhat more volatile element called Radium B, of which the average life is half an hour. Radium B is decomposed in a different way, little studied as yet, into another, less volatile element, Radium C, whose atom has an average life of 40 or 41 minutes. This gives off, not merely such rays as radium itself emits, but, besides others, great penetration, and there is left another element, a little more volatile, called Radium D. The average life of the atom of Radium D is over half a century, and in its decomposition no rays at all are given off, and the non-volatile element, Radium E, remains. This has an average of nearly nine days, and, in decomposing, gives off only the more penetrating rays, none of those by which radium affects the photographic film, and is converted into the first of the new elements discovered by Mme. Curie, polonium, which has an average life of ten months. But we will not pursue these vicissitudes further. Polonium is an element very much like bismuth. Dr. Bollwood holds that all these changes come to an end with the production of lead, but we cannot understand that in an absolute sense; and it is not particularly unlikely that lead should be converted into gold. In fact, the tales of the philosopher's stone and of projection do not seem today half so marvelous as what we may see at any moment by looking into a spintharoscope.

LEAD REFINERIES.—At the present time there are only four large producers of refined lead in the United States, namely, the American Smelting & Refining Company, through itself and its allied interests, the Balbach Smelting & Refining Company, the St. Joseph Lead Company and the St. Louis Smelting & Refining Company, the last being one of the subsidiary companies of the National Lead Company. It is even probable that there will be a further consolidation of interests, since during the latter portion of the year there was a good deal of talk as to the eventual consolidation of the United Lead Company (American Smelting & Refining Company) and the National Lead Company, a combination which has been under consideration for several years.—W. R. Ingalls in *Eng. & Min. Journal*.

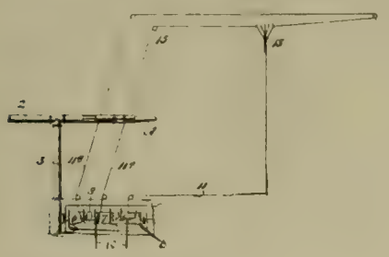
There is good reason to believe that in radium, and in other elements possessing very complex atoms, we do actually observe that break-up and spontaneous re-arrangement which constitute a transmutation of elements.

Mining and Metallurgical Patents.

PATENTS ISSUED JANUARY 16, 1906.

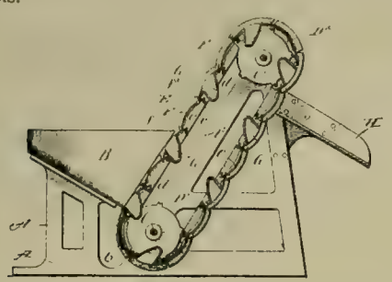
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

DEVICE FOR REMOVING MINING AND OTHER DEBRIS.—No. 809,593; S. W. Wible, Bakersfield, California.



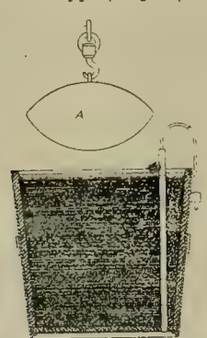
An apparatus for removing rock and debris, comprising drums loosely mounted upon a motor-driven shaft, means for engaging drums with or disengaging them from the shaft, a rake, a rope extending from the rake to one of drums, direction pulleys around which the rope passes, other ropes connecting with opposite sides of the rake, direction-pulleys around which the ropes pass, and independent winding-drums with which ropes are connected and by which the rake is placed in position.

CONVEYER.—No. 809,316; J. W. Mackin, Chicago, Illinois.



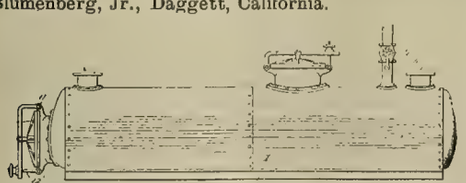
The combination with supporting-frame, of guide-wheels journaled at top and bottom of frame and located out of vertical alinement, an endless conveyer passing around wheels and comprising buckets and intermediate plates having overlapping adjacent edges, tops of buckets being flush with surface of intermediate plates, a supply-hopper the lower edge of which terminates adjacent to conveyer and lies below axis of lower guide-wheels, and a chute supported by frame and located beneath upper guide-wheel.

METHOD OF SKIMMING SLAG FROM MOLTEN METAL.—No. 809,405; M. M. Suppes, Elyria, Ohio.



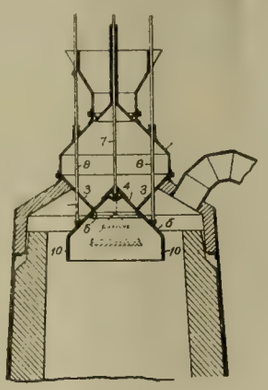
Method of skimming slag from liquid metal, which consists in displacing the slag by the immersion, or partial immersion, therein, of a displacing mass or body, having a specific gravity higher than that of the slag and lower than that of the underlying metal.

PROCESS OF MAKING BORIC ACID.—No. 809,550; H. Blumenberg, Jr., Daggett, California.



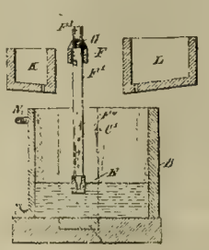
The process of producing boric acid, consisting in generating sulphur dioxide continuously by burning sulphur in a vessel, supplying vessel continuously with air under pressure, introducing sulphur into vessel without interrupting process, temporarily diverting a portion of the sulphur dioxide to the outside atmosphere during the introduction of the sulphur, leading the sulphur-dioxide gas into the presence of ore, which is finely divided and mixed with water in suitable proportions, resulting in decomposing the ore and freeing boric acid, which is taken up by the water in solution, and separating the product by evaporation.

CHARGING APPARATUS FOR BLAST-FURNACES.—No. 809,754; G. C. Shackleford, Allegheny, Pennsylvania



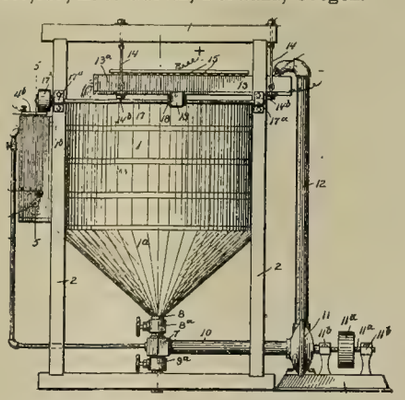
A charging apparatus for blast-furnaces, having in combination a feed-hopper, a distributing-bell arranged below the hopper and having an opening in line with and of a diameter not less than the diameter of the opening in the hopper, means for raising and lowering the distributing-bell, a main bell adapted to close the openings in the hopper and distributing-bell, and movable through the latter to closed or normal position.

PROCESS FOR PRODUCING COMPOUND INGOTS.—No. 809,871; M. Weiss, Philadelphia, Pennsylvania.



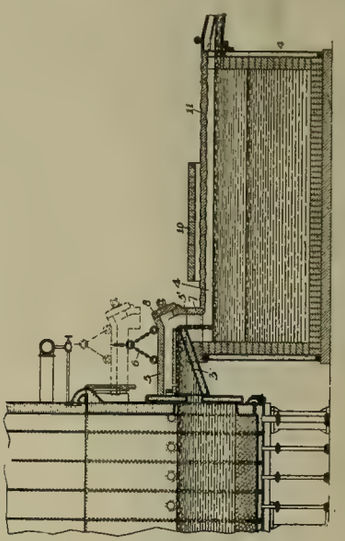
The process of making compound ingots of different materials in different parts, which consists in pouring molten materials of different composition into a mold side by side, and heating the materials at their point of interflowing.

APPARATUS FOR RECOVERING PRECIOUS METALS.—No. 809,939; E. J. Garvin, Portland, Oregon.



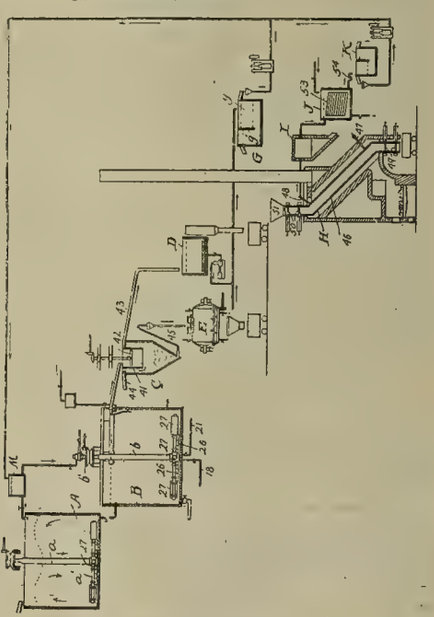
An apparatus comprising in combination a supporting frame, a main tank mounted thereon having conical bottom and valved outlet, a junction member into which valved outlet of the main tank discharges, a valved off-take for junction member, a separating tank mounted on supporting frame and having an inlet in communication with the main tank near its top and an outlet at a point below its inlet, separating tank having its sides provided with a plurality of grooves, a plurality of metal plates held in grooves and forming anodes, a cathode mounted in separating tank below anodes, cathode comprising a cylindrical member consisting of end disks, metallic strips connecting end disks together, cathode being rotatably mounted in separating tank, separating tank having a concaved bottom adapted to receive mercury to cover the lower portions of cathode, a valved pipe connection communicating with junction member and the outlet of separating tank, an amalgamating tank loosely mounted on supporting frame above main tank and having a discharge outlet adapted to discharge into main tank, amalgamating tank having its sides provided with grooves, a plurality of metallic plates held in grooves to form anodes, the lower edges of plates being held in a plane below the upper edge of the outlet of amalgamating tank to form a trap, a metal plate within amalgamating tank below plates and forming a cathode, amalgamating tank adapted to contain mercury, a pump in connection with junction member, and arranged to pump the material from junction member into amalgamating tank, and means mounted on the supporting frame and in connection with the amalgamating tank for agitating the same.

METHOD OF SAVING METAL VALUES FROM SLAG.—No. 810,364; C. M. Allen, Lolo, Montana.



The method of saving metal values from slags, which consists in withdrawing the slag and matte from beneath the surface of the molten bath, thereby trapping the blast, and permitting them to overflow from a furnace-spout into a forehearth or separating-chamber, and conserving the original heat of the matte and slag by protecting them from the chilling effect of air during their flow into the forehearth or separating-chamber.

PROCESS OF SEPARATING MINERALS.—No. 809,959; E. B. Kirby, Rossland, Canada.



The process of separating minerals, which consists in mixing together pulverized mineral material, a considerable quantity of water, and a substance immiscible in water, but of less specific gravity, and which will, in the presence of water, adhere to some of the mineral particles and not to others; in violently agitating the mass so as to break up immiscible substance into minute globules; in allowing mass to settle whereby a considerable quantity of the mineral particles having become coated with substance will float to the top of the mass, and in gently agitating the portion which settles, and in blowing into the same a gas for the purpose of assisting the flotation of substance and the mineral particles coated therewith; in removing the floating layer, and in separating the mineral particles from immiscible substance.

MINING SUMMARY.

Specially Compiled and Reported for the MINING AND SCIENTIFIC PRESS.

Special Correspondence.

LONDON, January 17.

The new year has been ushered in with some notable mining discoveries. Taking the first rank in importance, perhaps, is the big strike in the Anaconda. Known in December, if not earlier, by the wise and prudent, the fortunate ones on the ground floor, it has now been revealed to outsiders, the less lucky occupants on the upper floors, where the babes of mining finance do mostly congregate. Even putting the value of the net ore reserves at £20,000,000, as reported, the nourishment left for the said babes is sufficiently diluted for their weaker powers of digestion at something like £13¼ the dose. The Indian section, which enjoys the support of a numerous body of constant admirers, many of whom have done well in following the fortunes of the small but important group of mines in the Mysore district, comes in for a good second place for notice under the head of new developments. The four deepest parts of the Mysore mine are looking remarkably well. In Ribbesdale's shaft, on the 3,226-ft. level north, the lode is 4 ft. wide, yielding an average assay-value of 1 oz. 18 dwt. per ton, and the same showing is found in a winze sinking below this level. The lode also has the same width in the south breast of the 3,226-ft. level, with an assay-value of 18 dwt. per ton, while a width of 1½ ft., with 1 oz. 17 dwt. per ton, is reported in the eastern workings on the same lode. In the 1,870-ft. level going south, after an extension of 391 ft., a new ore-shoot has been cut 2 ft. 6 in. wide, averaging 1 oz. 18 dwt. per ton. This mine, which made a record output for December of 18,463 oz., is likely to maintain its reputation during 1906 as one of the great gold producers of the world.

The Chinese "Slavery" question, although likely to create occasion for much irresponsible jabber in the new Parliament now being elected, has had its quietus for the present as a disruptive force in the Transvaal. The licenses already issued are said to cover the importation of coolies until 1907, and these are not to be interfered with by the new Government. There is, therefore, every prospect that the record output of over 21¾ millions sterling of gold during the past year will be equaled, if not exceeded, during 1906. The field of operations also tends to widen in the country outside the Central Rand district. Amongst the recent discoveries in this connection may be mentioned the very favorable development of the reef struck in October last by the East Rand Extension Company, the assay-value being reported as over 2½ oz. for a width of about 2 ft. The progress of this work is being closely watched, and if the improvement continues, it is expected a big impulse will be given to the whole of that portion of the East Rand. On the west central section of the Rand the newly formed Sanella Outcrop Reefs, Ltd., is operating on a block of 912 claims seven miles west of Johannesburg. The railway traverses a portion of the claims, and water supply is said to be adequate. Reefs are reported to have been proved by numerous shafts and cuttings, giving assay-values ranging up to over 2 oz. per ton. The Sanella property being south of the Witpoortje break in stratification, it is believed the same formation as on the Central Rand is assured. Not to be behind in some new interest for the immediate future, Rhodesia sends a report of a new diamond deposit—the result of explorations carried out by the South African Option Syndicate, Ltd. On the northern slopes of the watershed of the Zambesi and Limpopo rivers an alluvial deposit of sand and gravel was found, with a depth varying up to 60 ft. The occurrence of diamonds and other precious stones was considered to be local and due to a pipe in the vicinity. Eventually a deep deposit was discovered underlying the surface gravel, but totally different to it in character. The greatest ascertained depth of this deposit is 24 ft. During one complete month of 30 days 3,220 carats were recovered from the deep deposit, of an average value of 2.14 carats per load. This deposit is proved to extend for 1,500 ft. The maximum cost of working is expected not to exceed 1s. 6d. per load. A large proportion of the diamonds found are stated to be pure white, of finest quality, after cutting. The importance of this discovery is shown by the fact that a pooling arrangement is being made with De Beers. The Transvaal is also in the running for an addition to the copper supply of the world, a new discovery of this mineral being reported in the Oliphants River district.

The expansion in the world's trade during the past year in copper, tin, lead and zinc must have come as something of a surprise to those people—to be found in most lands—whose commercial creed may be summed up in the cry: "The country is going to the dogs." Although the output of copper has nearly doubled in the last decade, there is, in face of present requirements hardly enough to go round. The sources of production of copper, lead and zinc are such, however, that they may probably be counted on to meet the demands of international commerce without any great enhancement of the prices now ruling. It is a question if the same can be said of tin. Our greatest provider of this metal —the Malay Straits—did not increase its exports to this country during 1905, and the quantity available from that quarter is expected to show a falling off in the current year of some 2,000 tons—a serious deficiency. The rise in Eastern exchange is said to be mainly responsible for this state of things. Cornwall, under altered conditions of working and lease tenure, might be called upon for a more liberal output of the historic metal. Financiers, in view of the high price of tin and the improved means of working now in vogue, are found asking whether it would not pay to re-open some of the old mines, whose 'burrows' and desolate ruins of engine-houses are seen dotted about the districts of St. Day, St. Agnes, Helston, and the still farther west. Occasionally some little stirring of the dry bones in the hoary old county gives a mild promise of greater energy and hopefulness. Carn Brea is reported to have four levels developing rich virgin ground; virgin! after jogging along for 50 years or more. At Wheal Grenville, one of the best managed mines, a rich discovery is said to have been made just recently in the bottom level. No more of the old "lanes of tin" appear to be available in Dolcoath, but the "old bal" has shown increase of returns lately. A characteristic find is reported in the *Western Morning News*. A farmer digging for water at Gwinear, west Cornwall, struck rich traces of tin in an outcrop 12 ft. thick. Other outcrops rewarded the farmer's search, and it is said that parcels running from 250 to 500 lb. black tin per ton of 'stuff' have been prepared as samples. All of which shows that romance still vies with tin and pilchards as a product of "the old county."

TORONTO, January 25.

The question of the feasibility of smelting Canadian magnetite iron ores by the electric process is at present attracting much attention among mining men and metallurgists. A series of experiments to determine whether this can be done on a sufficiently economical basis to compete successfully with the present method are now being carried on at Sault Ste. Marie, Ontario, under the direction of Dr. Heroult, the noted French specialist. Early in 1904 a commission consisting of Eugene Haanel, Dominion Superintendent of Mines; F. W. Harbord, Metallurgist to the Government of India; C. E. Brown, of Peterborough, Ontario, and E. Nystrom, mining engineer, visited several places in Sweden, France, and elsewhere on the European continent, where the electric smelting process is carried on. They were accorded special facilities for making comprehensive tests as to the cost of smelting operations, and the result was a report highly favorable to the system. Last year the Dominion Government appropriated $15,000 to defray the expense of making practical tests in Canada to determine the adaptability of the process to Canadian ores and conditions, a special plant for the purpose being erected at the Sault Ste. Marie steel works. The tests so far made at the Sault have been on a small scale. The final experiments will be made with larger bodies of ore in a furnace of special design. Dr. Haanel went to Sault Ste. Marie this week to make an inspection of the plant preparatory to this test.

The experiments up to date have shown that nickel pig can be produced by the electrical treatment of nickeliferous pyrrhotite. The scope of the experiments includes other ores than iron, though the economical treatment of the latter is the main object in view. The discovery of the applicability of the process to nickeliferous pyrrhotite is regarded as of considerable importance to the Sudbury nickel industry, as much of the ore of that district is of this character.

Should the treatment of magnetic iron ore on a fairly large scale prove economically successful, it will solve the difficulty as to cost of fuel which has hitherto prevented the development of large deposits of iron ore in Ontario and Quebec, the distance of which, from the extensive coal supplies required by the ordinary smelting process, has so far been an insurmountable drawback to their exploitation.

Other experiments in the same direction are being carried on in Ontario. J. W. Evans, of Deseronto, Ontario, has forwarded to the Provincial Bureau of Mines specimens of steel manufactured directly from iron ores by electric furnace. One of these was smelted from titanium iron ore from the Horton mine, the time occupied in the process being 15 minutes. The other was produced from sulphurous iron ore from the Coe Hill mine in 20 minutes. Both appear to be of good quality. If these results can be produced on a larger scale, large quantities of these ores which, owing to their refractory character are not at present commercially valuable, may be profitably worked.

The mild winter has been favorable for continuous work in the Cobalt mining area, where several mines have been in operation throughout the season. The lack of smelting facilities which has hitherto been the great drawback will shortly be remedied. Timmins, Dunlop & McMartin, of La Rose mine, have given a contract for the erection of a smelter in which they will treat their own ores, as well as the output of other mines. W. G. Trethewey, one of the largest mine-owners, states that the latest reports from his property are highly encouraging. Samples taken at a depth of 65 ft. show a higher percentage of silver than those from the surface in the same locality. Much difficulty has been experienced in guarding the Gillies timber limit just south of the mining area from the inroads of prospectors, some of whom have removed ore. A number have been driven off the limit and several are under arrest. Fears are entertained for the health of the camp when the spring opens, as the sanitary conditions are very bad and the water is contaminated. Strict precautions will be necessary to avoid an epidemic. A great rush of miners, prospectors and speculators is anticipated, including a large number from the mining districts of British Columbia. Many companies are being organized and putting shares on the market at low figures to catch the small investor. Few, if any, of the properties of known value are offering any stock to the public.

A Toronto branch of the Canadian Mining Institute was organized on the 17th inst., the following officers being elected: Chairman, Eugene Coste, mining engineer; vice-chairman, B. A. C. Craig; treasurer, George Nickle; secretary, S. Dillon-Mills; councillors, A. P. Coleman and Willet G. Miller. This organization will co-operate with other branches organized at different mining centers of the Province in influencing legislation affecting mining interests. The meeting of the Ontario legislature has been called for February 15, and one of the most important measures to be considered is a thorough revision of the mining law, which is in a very complicated and unsatisfactory condition and entirely unsuited to present requirements. What is more especially needed is a clearer definition of the respective rights of the miner, the settler and the lumberman, the prevailing uncertainty under conflicting regulations giving rise to constant trouble and confusion.

ALASKA.

William Wehner has brought suit in San Francisco against Alexander Bauer to recover $42,651.88, the alleged cost of a hydraulic mining plant erected on Forty Mile river, Alaska, for the defendant.

Mineral development has become so active in the extreme eastern part of Alaska, and in the western part of the Yukon Territory, that an urgent demand for the marking of the international boundary has been made by mine owners and prospectors. Within the last few months it has been demonstrated to the satisfaction of several prominent mining operators that immense bodies of copper ore exist in eastern Alaska, especially in the White River region. The White river rises in eastern Alaska, but soon crosses the international boundary and empties into the Yukon south of Dawson. The part of the boundary involved is described in treaties between the United States and Great Britain as the one hundred and forty-first meridian of longitude, but prospectors cannot readily determine longitude, and there is confusion as to whether certain claims are in American or Canadian territory. As the mining regulations of the two countries are radically different, it is necessary to have a determination of the matter. What is wanted is the erection of visible monuments to define the boundary, and negotiations looking to the prosecution of this work by an international survey party have been opened between the State Department and the British Foreign Office.

The Copper River & Northwestern Railway Co. has completed its plans for a standard gauge track 360 miles in length from a point three miles west of Valdez and extending to a point a few miles west of the Canadian boundary. The present scheme embraces two branch roads, in addition to the main line, one of these being 40 miles in length and leading to the White river country, and the other thirty-five miles in length. This announcement was made before the Senate Committee on Territories by John Rosene of Seattle.

ARIZONA.

Cochise County.

The Empire State Mining Co. will resume work soon at Tombstone under the old management with Alex Erickson as mine superintendent.

The Naco Smelting & Refining Co., of Naco, has contracted with the Naco Real Estate & Improvement Co. to put in a smelter, to cost $75,000, and to have an initial capacity of 250 tons. Construction work is to begin within 90 days.

The first regular convention of the Arizona Mines Association will meet in Bisbee on Monday, April 9.

Mohave County.

The Tennessee mine at Chloride is being re-opened by S. R. Rhea.——The Yucca Cyanide Mining & Milling Co. is to begin active operations at the San Francisco mine, near Yucca, on March 1. The main shaft will be sunk 550 ft. deeper.

Pinal County.

A shaft is being sunk on the Augustine mine, near Florence, to a depth of 1,000 feet.

Manager George B. Chittenden of the Saddle Mountain Mining Co. reports that the new copper jacket furnace is capable of handling 150 tons of ore per day. This matte is shipped and sold to the Arizona Smelting Co. at Humboldt, Arizona. This property is on the north side of the Gila river, 15 miles east of Troy and 6 miles east of Winkleman, the present terminus of the Phœnix & Eastern Railroad.

Yavapai County.

The 40-stamp mill on the White Gold Mining Company's properties, near Wickenburg, is completed.—— F. O'Brien is putting in new machinery at his mines, near Wickenburg.

A contract has been let by the Arizona Gold Lode Mines Co., of Dewey, for the immediate installation of a cyanide plant of not less than 25 tons daily capacity.—— C. T. Joslin, of the Ideal Mining Co., of McCabe, is replacing the iron pipes at the mine with wooden pipes, the former having proved unserviceable owing to the presence of sulphuric acid in the water at the mine.

A pumping plant is to be put on the Agua Fria, to throw water through a six-mile pipe-line to the Little Jessie mines at Palace Station, near Prescott. Preparations are also being made for the erection of a mill at the mines with a capacity of 200 tons of ore a day.

CALIFORNIA.

Calaveras County.

The new owners of the Hog Hill or Napoleon mine, near Telegraph City, have started work. Engineers are at work widening the road from Milton to the mine, as it is intended to use a traction engine.

Contra Costa County.

The Mountain Copper Co., at Bull's head, east of Martinez, shipped to San Francisco recently 150 tons of copper. This is the first shipment the company has made, and has been re-loaded at San Francisco to a deep-sea vessel to be taken around the Horn to the refinery plant in the East.

El Dorado County.

The mill at the Sherman mine, north of Placerville, has been started. The shaft is down 250 ft.——The Mt. Hope mill, at Grizzly Flat, is running on good ore from the mine.

Fresno County.

An estimate of the production of crude petroleum in the Coalinga field during 1905, compiled by the Coalinga *Oil Record*, places the figures at 8,471,000 bbl. This is nearly 400,000 bbl. less than the 'official' figures. The monthly production of this field is 867,000 bbl. On January 1 there were 228 producing wells, with an average production per well of 135 bbl. Twenty-nine wells were drilling, with fourteen suspended and eight shut in.

Humboldt County.

Bert Lucas, owner of the Humboldt War Eagle mine at Willow Creek, 46 miles from Eureka, is in San Francisco for the purpose of purchasing a 50-stamp mill.

Kern County.

The DeGollia-Atkias Co., which recently purchased the tungsten properties belonging to the McCarthy-Taylor Co., has shipped a carload to Germany from near Randsburg.

In anticipation of the drawing off of the water of Kern river by the Edison Electro Co. upon completion of its works near Bakersfield, many placer mining claims have been located along the banks of the river where the stream will be drained. The power plant will be completed in September.

Nevada County.

The 20-stamp mill at the Central Consolidated mine, east of Nevada City, has been started. It is equipped with four concentrators and a slimes plant.

The concrete foundation under the west end of the new 30-stamp mill at the Champion mine, near Nevada City, was undermined by the overflow water from the creek last week. The west end of the main hoisting works was also damaged, the concrete foundations being weakened to some extent.

The Maryland mine, near Grass Valley, has been unwatered to the 800-ft. level and ore is now being taken out on the 500-ft. level.

The Posey gravel mine, west of Grass Valley, has been bonded by Robt. Richardson, who intends to run a 600-ft. tunnel.

The Isis Gold Mining Co. will put in a 5-stamp mill at Canyon creek, near Washington, as soon as the roads will allow hauling the machinery.

Placer County.

Superintendent Geo. McAulay is increasing the working force at the Jarvis mine, at Red Point.——The Paragon hydraulic mine, at Bath, has been closed until the water can be drawn from the pit.——The leasers working the Red Point mine are preparing for a big season's work.——The Eureka, Butts, Hathaway and Kirkland mines, near Ophir, have been bonded by D. C. Munroe of New York. Electricity will be put in for power.——Work in the shaft of the Hidden Treasure mine, at Bullion, has been temporarily stopped by the flood of water from the melting snow.

San Bernardino County.

C. E. Wilbur, manager of the Standard Nitrate Co., is building a reduction plant in the Chimehuevis valley. ——It is expected that the steam plant at the Vivian mine will be completed soon.

The Bonanza King Development Co. of Los Angeles is preparing to build a 10-stamp mill at the mine in the Providence mountains, which it acquired two years ago and which it has been working since last September. The mill is to be running by May 1st.

John O'Donnell has made a strike on his claim in the Grapevine district which has caused a rush from Barstow. The region has been located for miles.

San Luis Obispo County.

The California Petroleum Refineries Co. has decided to purchase 115 acres of land near San Luis Obispo for an oil refinery. The company also will build a wharf, and contract has been signed to take the product from the Graciosa Oil Co. for the next 10 years. A pipe-line will be laid from the wells to the refinery.

Sierra County.

Robt. Jones and associates, of San Francisco, have bonded the Hilda mine, near Sierra City, and will work it as a drift mine when the weather allows.

Siskiyou County.

Owing to heavy rains and subsequent cold weather, work has been stopped temporarily on a number of claims.——The Yreka Creek Dredger Co. has been drilling in Yreka Basin, between Yreka and the mouth of the creek at Shasta river, below Hawkinsville.——Ault & King have started a tunnel 150 ft. below the discovery workings at their claim on Six Mile Creek.

The Black Bear group, which consist of the Yellow Jacket, Black Bear, South Black Bear and East Black Bear, near Yreka, has been sold to San Francisco parties by John Daggett and Son. The new company intends to commence development work and will add a cyanide plant and mill.

Trinity County.

The 25 miles of ditch to carry water from the east fork of Stewart's Fork to the Beaudrey and Unity mines, near Minersville, are almost finished. The five giants will soon be started.

Tuolumne County.

Beginning April 1st, the Longfellow mine, near Groveland, will be operated by electric power from the Blue Lake plant.

The Omega mine, near Jamestown, has been sold to the Mother Lode & Table Mountain Gold Mining Co. The three-compartment shaft is down 165 ft. Drifting is to be started to open up the vein and a nearby gravel deposit.

The Louisiana mine at Cherokee has been bonded by the Laurel Gold Mining & Development Co., and machinery is being secured for immediate work.

COLORADO.

(Special Correspondence).—Some of the mines in the Cripple Creek district are reported as having declared their intention to not renew the leases as they expire on the property, but will resume operations on company account, believing that they can do more and better work for the stockholders and at the same time increase the profits. In some instances the leasers have been able to make money where the company operating on its own account has not been able to pay expenses. While the leasers may make more money for the company in handling the ore cheaply, yet they do not as a rule take as good care of the property as the company. ——The mining of tungsten in Boulder county is in a more prosperous condition than for some time past. During the early fall and winter there was a scheme on foot to combine all the tungsten producing properties, which did not prove a success. For a time the price of tungsten was cut very materially and many of the mines closed during the low price, but recently the price is understood to have advanced and properties are beginning to be opened up.

Denver, Jan. 29.

Clear Creek County.

E. F. Fitzgerald has resumed work on the United States tunnel on Chicago creek, near Idaho Springs, after an idleness of ten years. He secured under bond and lease all of the interests in the Washington, Crosscut, Accidental, Harrison and other lodes. These veins will all be cut by the adit on the United States lode. The adit is in 670 ft., and is expected to cut the Washington within the next 450 ft.——Maxton Bros., after a temporary shutdown, are preparing to start up the Lebanon property, near Georgetown. A compressor is to be put in at once. A concentrator is planned.

John Oaklum has resumed operations on the Scott lode on Republican mountain, near Georgetown. A shaft is to be sunk to prove the continuity of the ore streak.

The Waltham Mining & Milling Co., of Idaho Springs, is sinking the Ward shaft, which is now 209 ft. deep, another lift and will continue it to a depth of at least 800 ft. The lower levels demonstrated the existence of an orebody, which carries lead in sufficient quantities to make it a desirable smelting ore, and this discovery upset the plans of the company, which had put up a cyanide plant to treat the ore, with the expectation that the oxidized ore extended to a considerable depth. The collar of the Ward shaft is near Chicago creek at almost the lowest altitude in that section, so that the shaft will be the deepest in the district. The tunnel method cannot be used.

The Covode Mining Co. has resumed operations on the crosscut tunnel running on the east slope of Covode mountain, near Empire. B. J. Hatmaker, of Rochester, N. Y., is superintending work.

The Scotia Mines Co. has resumed work on the Maine-Phœnix group on Sherman mountain, near Silver Plume. A working privilege through the old Antelope tunnel for five years has been secured by the company. In this tunnel a drift on the Maine lode has been driven to the boundary of the Antelope ground, and this level is 120 ft. below the workings that are now being cleaned out. The company intends to build a concentrating mill. The Scotia company has a lease on the Backbone and other lodes, which will be worked in connection with the Maine, Scotia and Phœnix.

Manager F. A. Maxwell is preparing to resume work at the Empire tunnel, near Empire, which is now in 3,100 feet.

Eagle County.

James W. Newell, general manager of the Pittsburg Gold-Zinc Co., is investigating the Iron Mask mines at Red Cliff. They are now shipping from 2,000 to 3,000 tons a month to the Colorado Zinc works at Denver. The zinc content averages 45 to 47 per cent. The oxidized iron output is 50 tons daily, carrying gold, silver and lead.

The Polar Star mine, near Red Cliff, has been leased and bonded to Graham and others for five years, and a force is already opening it up. Pontius & Co. are driving the Johnson lode, near Red Cliff.

Gilpin County.

A strike of good concentrating ore is reported from the 1,400-ft. level west of the Old Town mine in Russell district, near Central City. G. J. Mitchell of Idaho Springs is manager. —— A new hoist is being put in at the Forks mine on Quartz hill, near Central City, by Manager E. C. Betts. —— The Eagle Ore & Milling Co. has leased the Engelburg mine on Winnebago hill, near Central City. J. G. Eversman & Co., of Denver, are interested and will put in new machinery. The shaft is down 200 feet.

Hinsdale County.

The Moore plant of the Hanna Mining Co., near Lake City, which has been entirely remodeled, will start its electric separating machines and other concentrating devices soon.

Work is to be resumed at the Armitage mines in Silver Coin gulch, near Lake City, by G. F. Gardner.

Lake County.

Lessees operating the Ella Beeler in Iowa gulch, Leadville, while making connections for an air-shaft between the upper and lower workings, struck a good orebody. ——Recent developments in the Cloud City show that it will soon become one of the heaviest shippers of manganese ore in Leadville.——The orebody in the Home extension has been opened in the Cloud City territory to the east, and when both of the ore-shoots are opened the operators will be able to ship 75 tons daily.——The Little Nell, on Carbonate hill, which is being worked at the 525-ft. level, is shipping a good grade of mineral and they are developing at a lower level to catch the shoot below.——At the Old Enterprise shaft, west of the Castleview, a drift is being run to connect the two properties which, when completed, will enable the lessees to double the present output. From a raise in the drift a large body of manganese has been cut.

La Plata County.

(Special Correspondence).—A good strike has been made on the Gold Dollar. Hunter & Price, who have a lease on the property, opened up three feet of ore which is said to be all of shipping grade. They are now at work on the lower tunnel and drift.——A small force is at work on the Bay City driving the crosscut tunnel.—— W. A. Stewart has purchased the interests of Hawkinson, Fry & Reynolds in the Alpine claim, near the Idaho, and will commence development at once.——The May Day continues its shipments of about one carload per day. The lower tunnel, which will be made the main working tunnel, is being extended to cut a vein east of the developed vein, and the framework for the tunnel terminal of the new tramline is almost completed. The ore-washer will be moved to this point.——Heavy snows and slides have closed the road to the Empire mine, and, the coal supply becoming exhausted, operations have been suspended until it is possible to open the road.

Marcos, January 29.

Ouray County.

The Crawford-Jackson Gold Lion Mines Co. has secured title to claims in the Red Mountain-Ironton district. Work will be commenced on a tunnel that will develop the property for a mile and a half under the western slope of the range toward the boundary lines of the Camp Bird properties. Starting nearly opposite the Joker tunnel above Ironton to the west at the mouth of Galena Lion gulch, the bore will be driven west, following the course of the Mountain Lion lead and cutting the Betsy lead. Work on the tunnel will be started by hand.

San Juan County.

Four electrical separators are to be placed in the Grand Mogul mills at Gladstone to concentrate the zinc ores.

San Miguel County.

Under the management of Otto Erickson, the Caribeau-Montezuma mines at Ophir are making a good record. Large areas of new stoping ground are being blocked out. The concentrating plant is treating 35 tons daily. The capacity will be enlarged in the spring to 100 tons daily.

George B. Pickett, manager of the Carbonero mines, on Silver mountain, near Ophir, has just started a deep crosscut tunnel which will cut the Carbonero vein at a depth more than 2,000 ft. The ore from the Carbonero is shipped to smelters as it is taken from the mine, with scarcely any sorting. After the lower tunnel has been run 300 ft. an air compressor will be put in and drilling thereafter done by machine.

Summit County.

The Pennsylvania mine, near Argentine, W. B. Le Wald manager, is operated through a crosscut tunnel and is producing daily seven tons of shipping ore, which is hauled nine miles to the Colorado & Southern Railway at Keystone.

Teller County.

Construction work on the mill and cyanide plant of the Wishbone Gold Mining Co., between Mineral and Carbonate hills, Cripple Creek, has begun and it is expected that the new plant will be completed by April 1. The plant will be of 100 tons daily capacity.

The Oro shaft on Ironclad hill, Cripple Creek, is to be continued from the 120 to the 220-ft. level, by Lessee Springer, of Colorado Springs. A hoist is to be put in. ——R. A. Airheart intends to sink from the 350 to the 600-ft. level of the Rocky Mountain, on Beaver hill.—— Leases on the Last Dollar mine, near Cripple Creek, are not to be renewed, as the company will resume on its own account.——Snell, Crump & Harrison, who have a lease on the Little Joe claim of the Alert Co., on Ironclad hill, are preparing to put in machinery and sink the shaft from the 100 to the 200-ft. point.——The Henry Adney shaft, in Beacon Hill gulch, is down 600 ft. and a crosscut has been started toward the C. K. & N. vein by Superintendent David J. Burke.

At the annual meeting of the stockholders of the Golden Cycle Mining Co. it was decided to expend $400,000 in enlarging and improving the Telluride mill at Colorado City, giving the mill a capacity of 400 tons daily. The minority stockholders, who have been fighting the purchase of the Telluride plant in the courts and at stockholders' meetings for months, were not represented. The mills will be in operation by Aug. 1, and the cyanide process will be used. The rebuilding of the Telluride mill is the outcome of a long fight. The plant was built for the chlorination process by the old Telluride Company but proved unsuccessful and the General Metals Company, which bought the mill, went into bankruptcy. New drums have been put in on the hoist in order that 300 ft. more of cable may be used. The shaft will be sunk 100 ft. more, extending it to a depth of 1,100 ft. The shaft of the Theresa property, adjoining the Cycle and belonging to the same company, will be sunk to the depth of 1,000 ft. The shaft is now down 700 ft. It is the intention of the Golden Cycle people to use the Theresa shaft for hoisting and lowering men and to handle all of its ore through the shaft of the Cycle.

Nicholas Gardner and associates, lessees in the Home claim of the Cedar Hill Gold Mining Co. on Ironclad hill, near Cripple Creek, will sink the shaft, which has been sunk to a depth of 145 or 150 ft., 100 ft. deeper.—— An ore shoot has been struck by Weber & Snyder, lessees, in the Gold Sovereign property, near the northern extremity of the Trilby.——A steam hoist has been moved from the Los Angeles mine to the Dante mine, and set up at a shaft 400 ft. deep, through which lessees are operating.

IDAHO.

Blaine County.

The Supreme Court of Idaho has confirmed the title of Fred C. Bradley and R. F. Bueler, of Hailey, to the Snowslide mine in the Muldoon district.

Boise County.

M. E. Hopkins, manager of the Nellie mine at Horseshoe Bend, reports that the long crosscut tunnel has been driven 800 ft., and has about 200 ft. more to go before reaching the main vein.

Idaho County.

The Hogan mine at Orogrande is making a better showing. The batteries are to be changed from single to double discharge and additional riffles put in. The copper riffles already in place are proving effective in catching the coarse gold from the rich streak.—— Duluth and Eastern men are developing the Butterfly group, south of Orogrande.

E. Haug, superintendent of the Dewey mine, is preparing to add 10 stamps more to the present mill near Roosevelt. —— The owners of the Sunnyside mine, near Roosevelt, intend putting in a cyanide plant.

Nez Perces County.

The new dredge ordered by M. H. Hare for the placer grounds near Pierce is at Greer, ready to be transferred to Pierce. It has a capacity of 2,000 yards daily. This will be installed and ready for operation in the spring.

Shoshone County.

Fire broke out Jan. 30 in the Bunker Hill & Sullivan

mine at Wardner, between the sixth and seventh levels. The smoke and gas speedily drove the 75 miners from the workings. Many of them were nearly overcome and reached the surface with difficulty. A section of blazing fuse or a candle left carelessly in the mine is believed to have started the fire. Late reports state that the fire is under control and no damage has been done other than that by smoke.

MICHIGAN.

Houghton County.

(Special Correspondence).—There has been no change in the condition of the Tamarack mine during the past two weeks. Owing to the fact that three men were caught underground at the time of the fire the management kept the shafts open for several days in the hope that these men might be enabled to escape, but when it became apparent that there was no further prospect of the release of the unfortunate miners, the three shafts affected were sealed with heavy timbers, and the cracks in the timbers tamped with earth and clay. The shafts have been sealed for nearly two weeks, but gas is still escaping through the cracks in the sealing and in such quantities that men working in the shafthouses have been overcome on several occasions by the carbon monoxide fumes coming from the underground openings. There have been so many and such serious fires during the past twenty years in this district that a considerable fund of experience has been accumulated, and a regular plan of fighting such fires is now followed. In the earlier fires at the Calumet & Hecla, nearly twenty years ago, attempts were made, with partial success, to drown the flames by means of carbonic acid gas, which was manufactured in large quantities in immense steel boilers by treating crushed marble and limestone with dilute sulphuric acid, pipes from the boilers being connected with the mouths of the shafts, and the resulting carbonic acid gas, which is heavier than atmospheric air, being allowed to drop by its own weight to the bottom of the mine and stifle the flames by cutting off all oxygen. Further experience has shown that the most successful plan of dealing with a fire in a deep mine is to seal over all shafts connecting with the flames, and thus starve the fire from lack of oxygen.

Houghton, Jan. 29.

MONTANA.

Deer Lodge County.

Four of the largest induction motors ever installed in the West will be used to furnish power at the $9,000,000 reduction plant of the Anaconda Copper Mining Co. The Allis-Chalmers Co. of Milwaukee will furnish this electrical equipment for the 8,000-ton concentrator and the street railway company at Anaconda. The concentrator equipment will consist of four 1,200-h.p. induction motors, three 300-kilowatt motor generator sets, together with the usual auxiliary accessories. This order follows the determination of the Anaconda company to substitute Missouri river power, transmitted 90 miles at 70,000 volts, in place of the present power system. Each of the big induction motors will weigh over 40 tons, the weight of the entire equipment when ready for shipment being 259 tons. The motors will be used in the concentration building, which is 600 ft. long, through which a main line shaft extends the entire length. The motors will be rope-connected to this shaft and will carry the entire power load.

Fergus County.

Henry M. Rae, manager of the Drake properties at Kendall, says that the contract has been let for sinking a shaft on the North Moccasin at Kendall. The work is to begin at once, and when the shaft is down, the company will drift to the ore struck by the diamond drill. An electric hoist has been ordered.

Granite County.

Manager George H. Savage of the Milwaukee Gold Extraction Co., in the Red Lion district, near Philipsburg, states that work has been suspended until spring on account of the freezing of the water supply.

Madison County.

F. M. Longshore, H. A. Fosselman and B. J. Wall, owners of the Copper Chief property, at Silver Star, have arranged to put in pumping and hoisting apparatus within 90 days.

William C. Morris & Brother have suspended operations in the Strawberry 10-stamp mill, near Pony. They had been running the mill on ore from the Boss Tweed and Clipper mines on Mineral hill.

Silver Bow County.

(Special Correspondence).—The Butte Copper Exploration Co., with a capital of 100,000 shares at $5 par, is the latest copper mining company to be organized in Butte. The company has purchased seven quartz claims northeast of the Pittsburg & Montana company's properties, and 11½ acres of placer ground adjoining the quartz claims. The ground lies outside of the developed portions of the Butte district, but there are two shafts on the ground, one 440 ft. deep and the other 130 ft. deep, which were sunk years ago by prospectors. Several veins run through the ground, but the early prospectors did not find in them sufficient value to justify further development work at that time. Among those interested are E. A. Nichols, of Butte; N. Bruce McKelvie, S. R. Hill, F. E. James and Thomas S. Dee, of Boston, and A. F. Leopold, of Chicago.——Ralph Baggaley, who has been manager of the Pittsburg & Montana company since its inception four years ago, has resigned and will return to his home in Pittsburg. Oscar Rohm succeeds him as general manager. Mr. Baggaley says his retirement is in line with his original intention when he took hold of the company, and that was to leave the active work to others as soon as the company was placed on a paying basis. He still retains his interest in the company. The company is now treating 200 tons of ore a day, which is the limit of the present smelting plant.——The Amalgamated Copper Co. is striving to break all records of copper production in 1906. Its January product will reach 23,500,000 lb., and the output will likely be increased gradually through the year, if the price of copper and the demand for it are maintained.——The Washoe smelter, at Anaconda, is treating 7,800 tons of ore daily, while the Boston & Montana smelter at Great Falls is treating 3,780 tons a day. The output of the other companies operating in Butte has also been increased.——The East Butte company is not hoisting any ore at present from either the Dutton or Yankee Boy mines. The latter is undergoing repairs and the Dutton shaft is being converted into a three-compartment shaft to be used as the main working shaft for all the East Butte mines. It is being enlarged from the 300-ft. level to the surface, and when that portion of the work is completed a new hoisting plant will have been installed and sinking to a depth of 1,000 ft. will be begun. Crosscuts will be run north and south. In the meanwhile leasers will continue working the Mary McLane, Lassan, Wheeler, Oneida and Simons mines, and it is expected that the royalties will pay for the contemplated improvements and development work. The company has added 100 acres to its holdings. It will be six months before the company's mines will all be producing ore again.

Butte, January 29.

Boston & Montana is shipping from its Butte mines to Great Falls 112,000 tons of ore per month. The shafthouse on the Poulin mine is being torn down by the Amalgamated on account of the likelihood of fire. The house is not being used and has not been occupied for some time. The mine is being worked through the Mountain Consolidated. The company has adopted this policy in regard to all its unused shafthouses of any size.

NEVADA.

Esmeralda County.

A representative of the Mammoth Copper Co. at Kennett, Shasta county, Cal., has been making contracts for the delivery of a maximum of 200 tons of ore daily to the smelter from Goldfield and Tonopah. They have offered a shipping rate of $9 per ton to the smelter, $2 less than the present tariff charged by the railroads.

Contracts have been let by Surveyor-General Kyle for the surveying by township lines of half a million acres of unsurveyed mineral lands near Kawich, Lida, Bullfrog and Ash Meadows. Contracts covering nearly twice as much territory will be let later in the month, and the work is to be begun at once.

At a recent meeting of the Manhattan Miners' Union a scale of wages for the district was adopted as follows: Drifting, stoping and trenching, per shift, $4.50; sinking and raising, per shift, $5; working in wet places, 50c. per shift extra; tool dressers and blacksmiths, per shift, $5.50; timbermen (no helpers), $5; machine work, 50c. extra per shift more than hand work; engineers, per shift, $5.50; all contract work $1 per shift more than company work. No man in or around the mines will be allowed to work more than eight hours.

A new 50-h. p. electric hoist is being put in at the January mine at Columbia. An assay office has been built and is now being equipped.——Arrangements are now being made by Harry Taylor and Gurney Gordon to sink a shaft on the ledge at the C. O. D. mine at Goldfield.

Nelson Brothers, of Goldfield, have let a contract for a 200-ton sampler, to be erected within the next few months.——Henry Jaggles of the Lida Queen, at Lida, is in San Francisco negotiating for machinery. It is proposed to erect a roller mill of 70 tons capacity at the mine, the water to supply which will be piped from Mt. Magruder, where the company owns two springs. A hoist of sufficient capacity to go 1,000 ft. is to be included in the equipment.——F. L. Felter, secretary of the Gold Mountain Exploration Syndicate, of Gold mountain, near Goldfield, states that the syndicate will drive a two-track tunnel into the mountain.——The new five-stamp mill at the Mohawk-Alpine mine, at Silverpeak, has started up.

Eureka County.

B. L. Plummer, manager for the company who recently bonded claims at Mineral Hill, states a 50-ton furnace is to be put in under the supervision of Charles H. Gage. G. L. Kennedy is at the mines.

Lincoln County.

At Jack Rabbit, 16 miles from Pioche, the Nevada-Utah Co. has retimbered the old workings of the Day mine. An aerial tramway has been built to connect the mine with the receiving bins along the tracks of the narrow-gauge railroad, which connects Jack Rabbit with Pioche. This road is now owned by the Nevada-Utah Co.——At the Meadow Valley mine the No. 5 shaft is being retimbered. This shaft is 1,200 ft. deep.——At the Raymond & Ely mine, near Pioche, a new shaft-house and gallows-frame have been built over the Phœnix shaft, which is being re-timbered.

W. H. Wilson, general manager, C. H. Raymond, assistant general manager, and C. E. McCarthy, engineer of the Good Springs and Sandy smelter company, while in Los Angeles announced that arrangements have been made to build a 100-ton smelter at Good Springs and one of equal capacity at Sandy.

Nye County.

E. A. Montgomery, of the Montgomery-Shoshone mine at Bullfrog, has been in San Francisco arranging for new machinery and for a 150-stamp mill.

The United Investors' Co., of New York, which has bought the Peerless group, at Bullfrog, has men at work on two crosscut tunnels to intersect the ledges running from the Denver mine.

Washoe County.

The Green Hill-Nevada Co., under the management of J. M. Thomas, with J. D. Poole as superintendent, is blocking milling ore in their claims, near Olinghouse.——The Jim Blaine mine at Olinghouse is being worked by the Ohio company, under the management of E. P. Clemmons.——The Keystone-Nevada company has 400 tons of milling ore on the dumps and a large tonnage blocked out on the Ora at Olinghouse. C. H. Bovee is general manager and Geo. W. Lloyd superintendent.——The Olinghouse Mining Improvement Association has been formed, with J. M. Thomas Jr. as president, R. W. Snow vice-president and O. M. Pudor secretary.

White Pine County.

In the Ely district, the crosscuts on the 750-ft. level of the Alpha vein, owned by the Giroux Consolidated Mines Co., are showing good values. The station is being cut on the 300-ft. level of the Giroux and the ore body will be blocked out for extraction in the spring.——The first payment of $6500 has been made by the Nevada Con. Copper Co. on the Elkhorn and Sunset claims, which are under bond from F. F. and H. A. Leoch.——The Cumberland - Ely Co. is sinking four double-compartment shafts on the Jupiter group. The deepest shaft is down 75 feet.

NEW MEXICO.

Grant County.

S. L. Bean, who is interested in mines in the Virgin district, has decided to build a smelter in the spring at Shakespeare, 10 miles from Lordsburg.

Otero County.

The grading for the new Y to the smelter site at Jarilla Junction has been completed. Contracts have all been let and material will begin to arrive shortly.——The Southwest Co. has completed the grade for another electric railway, mine gauge in width, from the upper terminal of the Lucky tramway to the Iron Mask at Jarilla Junction. This road is intended to afford easy access to the iron ores of Iron mountain.

OREGON.

Baker County.

T. H. White, C. W. Durkee and W. Ayres, of the Gold Coin mine, have returned to Baker City, from Portland, where they let a contract for a 100-stamp mill to be added to their present 10-stamp mill. They also ordered a new hoist to be shipped at once. Water is to be developed by a sinking plant with a three-compartment shaft.——Managing owner James A. Panting of the Gold Hill mine at Durkee, has had a full force retimbering some of the tunnels and stopes.——J. H. Graham, of Baker City, has secured possession of the Gold Coin Extensions No. 1, 2, 3, and 4 from J. J. Neel.

Work in the long crosscut at the Gold Bug mine, near Sumpter, has been discontinued, and the force has been placed in vein 3 drilling to the south.

Clackamas County.

Work has been resumed on the Copper Queen mine, near Welches, under the supervision of C. O. Merril.

Grant County.

W. W. Gibbs, superintendent of the Copperopolis mine, near Prairie City, will install a mill on the property this spring.

Jackson County.

All the main tunnels and drifts at the Opp mine, near Jacksonville, are now lighted by electricity. The company has put in an air compressor and power drills. It also plans to increase the capacity of the mill from 10 to 20 stamps early in the spring. Two shifts are taking out ore and putting in the bins for reserve.

The Opp mill, near Jacksonville, has been rebuilt and new concentrators put in.

SOUTH DAKOTA.

Lawrence County.

The Golden Reward Co., of Lead, has commenced to run a tunnel near the Ruby Bell mine to connect with the bottom of the Union shaft and to run in from White Tail gulch to the bottom of the shaft, a distance of 1,300 ft. All the water pumped into this shaft from the stopes in the mine will be discharged through this tunnel.

UTAH.

Juab County.

The following is the list of shipments made by the Tintic properties for the week ending Jan. 26: Ridge & Valley, 5; Centennial-Eureka, 45; Bullion-Beck, 11; Gemini, 20; Eagle & Blue Bell, 6; Uncle Sam Consolidated, 3; Yankee Consolidated, 6; Swansea, 4; Dragon Iron mine, 14; May Day, 4; Beck Tunnel, 5; Eureka Hill (lease), 3; Brooklyn Consolidated, 3; Ajax, 2; Black Jack, 1; Carisa, 4; Grand Central, 14; Lower Mammoth, 2; Mammoth, 17; Victor, 1.

Summit County.

Foreman William Campbell, in charge of the Ontario tunnel, states that work at the tunnel has been suspended on account of foul air, caused to a great extent by recent storms. The wet, heavy atmosphere prevents fresh air from entering the tunnel, and a candle will not burn at the 2,000-ft. mark. Until the weather clears up no attempt will be made to resume work. The face of the drift, where work was being prosecuted when water broke through, has not yet been reached, and the tunnel at the point where the work was stopped is completely filled up with dirt and debris.

Tooele County.

The mill at the New Stockton mine at Stockton has been started up again and the newly installed hoisting plant is in commission. Sinking the shaft 150 ft. deeper, to 1,000 ft. below the collar, will not interfere with the extraction of ore for the mill or for shipment. A new 8-drill compressor is being put in at the mine.

At the Consolidated Mercur at Mercur a crosscut is being run from the electric tunnel to the Magazine vein, to determine if pay values exist under the Magazine stope. The retimbering of the Golden Gate shaft is still in progress, but it is expected the work will be finished and hoisting resumed the first of February. The main station in the Mercur mine is being timbered with 12x12 Oregon fir.

WASHINGTON.

Chehalis County.

The Shaw Crucible Steel Co. has received four carloads of machinery at Hoquiam, which will be transported to their plant at Damon, near Oyehut, by scow. The buildings of the plant are all finished, and as soon

as the machinery is received it will be installed and the plant will probably be ready by March 1.

Ferry County.

(Special Correspondence).—Mill tests have been made at the Mountain Lion mine, under the direction of C. S. Verrill. The mine has been drained to the bottom level. On the east side of the Sherman range, south of Kettle Falls, the Nonpariel and other companies are operating. E. L. Terry and others, of Seattle, are opening up the Orient, Southern Cross, and Gwinn quartz claims. A lower tunnel is in 450 ft. The Gwinn, 3¼ miles west of the other claims, is opened by a shaft, down 150 ft. on the vein.——The Ben Hur shaft is down 319 ft., and drifts are being driven north and south on the vein on the 300-ft. level.

Republic, Jan. 29.

Garfield County.

Fanning Bros. have found a deposit of galena near Pomeroy that assays well in silver and lead.

Okanogan County.

(Special Correspondence).—The south drift from the lower tunnel of the Ruby mine, on Mount Chopaca, ran into a streak of ore rich in ruby silver and silver glance.

Loomis, Jan. 29.

Spokane County.

The owners of the Waverly mine, near Waverly, have decided to open up their property by running a tunnel.

Stevens County.

(Special Correspondence).—The First Thought Mining Co., operating near Orient, is shipping 40 tons of ore a day. —— The Napoleon mine, adjoining the First Thought and owned by the B. C. Copper Co., is producing 30 tons of gold-bearing ore a day, which is being shipped to the company's smelter, at Greenwood, B. C.

Northport, Jan. 29.

FOREIGN.

CANADA.

BRITISH COLUMBIA.

Boundary District.

The force employed by the Dominion Copper Co. in Phœnix has been increased since the company blew in the second furnace at its Boundary Falls smelter. The Brooklyn is working full time, and three shifts are working at the Stemwinder. The new seven-drill air compressor for the Rawhide has arrived at the mine. It will use electric power from Cascade. At the company's Boundary Falls smelter, the two furnaces are handling 750 tons of ore in 24 hours.

The Oro Denoro, in Summit camp, shipped 1,500 tons of ore to the Granby smelter last month. It is owned and operated by the Denoro Mines, Ltd., of which Smith Curtis is the managing director. Work is being done on the No. 4 vein, on the Great Northern Railway level.

Cassiar District.

William L. Breeze, of New York, president of the Bullion Creek Hydraulic Mining Co., has arrived at Atlin, where he will arrange for the extending of the company's flumes to higher levels, so that a greater head of water may be obtained.

Rossland District.

A 20-ft. shoot of ore has been reached by a crosscut from the 11th level of the War Eagle mine at Rossland. ——A station is being cut at the 1600-ft. level of Le Roi at Rossland.——It is hoped that work will be resumed at the White Bear upon the arrival of J. J. Warren, the managing director. The mine is unwatered nearly to the 1,000 ft. level.——Shipments for the week ending January 27 were: Centre Star, 4,140 tons; Le Roi, 2,130; Le Roi Two, 390; Jumbo, 200; total, 6,860 tons.

Vancouver Island.

The Commodore Mining Co. is preparing to make heavy shipments of engines, boilers, hoisting plant, etc., to its mines on Texada island.

MEXICO.

Chihuahua.

The report of John B. Farish to Dolores Mines Co., whose mines are in the Guerrero district, 120 miles from Minaca, states that the property was purchased upon the reports of Louis Noble, George A. Schroter, Philip Argall, and the results of a check sampling by A. Chester Beatty. Up to the time of purchase the property had been operated by the former owners with the idea of developing large ore reserves, and the latest report shows that there were then in sight in the mine 26,831 tons of ore, of an estimated gross value of $55 per ton, and 11,000 tons on the dump, the cobbings from richer ore which had been shipped, that averaged about $42 per ton; a total of 37,831 tons, estimated to yield a net profit of about $1,500,000. The reports of the examining experts contained no reliable data upon the treatment of the ore, and it would have been unwise to proceed with any construction before reliable tests had been made. These tests were entrusted to Godfrey Doveton and J. Gordon Hardy, and occupied the first three months of the company's life. Upon the completion of the tests the following method of treatment was adopted: The ore is delivered at the top of the mill, where it is screened through grizzlies. The coarse is broken through crushers and passed over a picking belt, the richer ore being picked out and fed separately to a battery of five stamps, where it is crushed through coarse screens and passed into Bryan mills, to be pulverized. The resulting pulp is amalgamated in pans and settlers, and the tailing mingled with the pulp of the lower grade ore. The latter, that which is rejected on the picking belt, is crushed coarse through the remaining 10 stamps, pulverized in Bryan mills, and the resulting pulp mixed (as stated above) with the tailing from the pan-amalgamation plant. This product is separated into sand and slime by spitzkasten and the sand is reduced to slime in a tube-mill, after which all is treated by cyanidation in the usual manner. It is confidently expected from the results obtained by Doveton and Hardy that at least a recovery of 85% of the gross value will be effected. Nearly all the machinery was furnished by the Allis-Chalmers Company of Milwaukee. As all the machinery had to be transported on the backs of mules across the mountains for 120 miles, it had to be sectionalized; that is, all machinery—so far as was possible—had to be reduced to pieces weighing not over 350 pounds. The starting of new enterprises in the mountains, particularly the building of railroads and operations of W. C. Greene, caused a greatly increased demand for the already scarce labor, and it became difficult to retain a full complement of workmen.

John J. Watterson, of Chihuahua, has decided to build a concentrating plant and a reverberatory furnace at his mine in the Uruachic camp. The mill will be built in units of 40 to 50 tons, and only one unit will be put in at present. A refining furnace will be added later.

Guanajuato.

Due to the mining activity around Guanajuato, the district is suffering from a scarcity of labor, says the Jalisco *Times*. Within the next twelve months it is expected that there will be between 400 and 500 stamps dropping in this district, and development work in the mines is being rushed to provide ore for such milling capacity. Good air-drill men are particularly scarce, and there are a number of permanent positions for foremen and shift bosses.——George W. Bryant, manager of the Peregrina Mining & Milling Co., has taken over El Cedro mines under an option. These mines are at the southern end of the mother lode of the Guanajuato district, and have been worked extensively. The mines are owned by a Mexican company.——T. H. Leggett, who is developing El Cubo group of mines in the Guanajuato district, has been directing the work for several weeks past.——Engineers are locating an entrance for the San Gregorio Railroad into Guanajuato, and construction of the line is expected to begin before the middle of the year. The San Gregorio Railroad now extends from Marfil to the San Gregorio mines, and is owned by the Dwight Furness Co. It will enter this city from Marfil, and that portion of the line will form a link of the proposed railroad from Guanajuato to Salamanca, where connection will be made with the National.

Mechanics are at work on three large stamp mills, near Guanajuato. The largest, which is just being started, is being erected at the Peregrino mine, with 120 stamps. The second is being erected at La Luz mine, with 100 stamps. The Valinciano mill, with 80 stamps, will soon be completed.

Puebla.

The Tetela Mining Co. has put in a 50-ton steam electric plant with crushers, rolling mills and roaster on its property at Tetela. The property is under the management of R. H. Hutton, with L. Chevrillon as metallurgical engineer.

Sonora.

A rich strike of silver-lead ore has been made in the Santo Domingo mine, near Alamos. A. P. Ballou and F. E. Mills, of Chicago, are interested, with J. R. Hendra as superintendent.

The Zambona Development Co. will soon have a small smelter completed to handle the output of its mine at Minas Nuevas, near Alamos. The company has a 40-ton mill at work, and this is to be increased at once to a capacity of 120 tons. Electric power and lights are provided and hoisting machinery has been put in.

President W. C. Greene, of the Greene Consolidated Copper Co., has issued to the stockholders a report on the company's operations, which says the production of copper from the mines at Cananea, for the five months ending Dec. 31, 1905, was 26,593,931 lb., containing 195,800 oz. of silver and 1,866,941 oz. of gold. Work has progressed rapidly on the ore-bedding plant, which should be completed by March 1. All the material for the first of the reverberatory furnaces being installed is on the ground and this furnace should be ready to blow in about March 20. It is intended to immediately follow with a second furnace of the same capacity of 300 tons per day for treating fines, flue dust and concentrates. Owing to the great increase of sulphur in the ores, fines for these furnaces must be roasted and they will then effect a very large saving in smelting cost, as well as give the company increased production. The four sections of the concentrator are now in operation and the installation of the 72 extra vanners is well under way. This increased vanner capacity will enable higher extraction of copper with but slightly increased cost. An additional water supply is needed at the concentrators to obtain the best results, the Ojo de Agua pump line being taxed to more than its normal capacity. This additional supply can be readily obtained from the Sonora river by duplicating the present pump line. During December, Manager Dwight and Superintendent Harry Kirk visited the Superior iron and copper district to investigate the latest practice in mining large bodies of ore by steam shovels and the caving system. Their observations convinced them that in the ore bodies of the Massey, Oversight and Veta Grande, at a comparatively low cost for the installation of electric tramming, a reduction in the cost of mining from $1 to $1.50 per ton could be made. Preparation is now being made for handling five blocks of ore by the caving system. Owing to the heavy rain and snow prevalent during November and December, a crush occurred in the Capote ore body Nov. 14, causing ignition of the pyrite ore in this mine. All drifts were immediately bulkheaded, shutting off the gases from other openings, and the fire will be allowed to burn until the sulphur in the ore is exhausted. Similar crushes have since occurred in the Massey and Oversight ore bodies by which the drifts opening up these bodies of ore were closed, temporarily shutting off the supply of first-class ore from this portion of the property also. These drifts are being re-opened as rapidly as possible. During the past few months development has shown a large increase in the amount of sulphur contents of the ores and has accentuated the need of roasters and additional reverberatory capacity, as recommended by Mr. Dwight and Mr. Lloyd. Plans and estimates for two batteries of roasters of four each have been prepared, as well as for the second reverberatory furnace.

The new 150-ton smelter of the Transvaal Copper Co., at Cumpas, is to start up this week. F. W. Fink is president and manager.

Personal.

A. F. HOLDEN is at Mexico City.

CHARLES J. ALFORD is in Egypt.

M. P. DALTON, of Denver, is in San Francisco.

D. W. BRUNTON, of Denver, is in San Francisco.

I. N. PEYTON, of Spokane, is at the Palace Hotel.

J. M. CALLOW, of Salt Lake City, has left for Europe.

A. F. STEVENS, of Silver City, Idaho, is in San Francisco.

G. McM. ROSS, of Copperopolis, is at the Occidental Hotel.

W. L. COBB is examining mines at El Tino, Sonora, Mexico.

JOHN B. HASTINGS is examining mines at Leadville, Colorado.

A. F. JONES, of Oroville, has been in San Francisco this week.

A. B. FRENZEL has returned to Denver, Colo., from New York.

O. O. MCREYNOLDS, Denver, Colo., is at Los Angeles, California.

WALDEMAR LINDGREN has returned to Washington from Europe.

J. PARKE CHANNING was at Houghton, Mich., during the past week.

J. E. BAMBERGER, of Salt Lake City, is at the St. Francis Hotel.

DUDLEY BAIRD, of Copperopolis, was in San Francisco this week.

P. A. BABB has removed his headquarters to Gante No. 8, Mexico City.

EDWARD HOOPER has returned to London from Western Australia.

JAS. W. MALCOLMSON has returned to El Paso from Guanajuato, Mexico.

JOSEPH DIETRICK, of Salt Lake City, has opened an office at Los Angeles.

A. J. G. SWINNEY has left London for a year's work in Sumatra and Borneo.

W. R. RUST, general manager of the Tacoma smelter, is at the St. Francis Hotel.

ALFRED JAMES has left London on a tour of Western Australia and New Zealand.

JAS. F. CALLBREATH, secretary the American Mining Congress, is at Salt Lake City.

CHAS. G. GATES is at the Gladstone mine, at French Gulch, Shasta county, California.

C. B. KINGSTON has been appointed manager for Lewis & Marks at Johannesburg.

G. H. BARNHART is manager of the Second Relief mine, near Nelson, British Columbia.

N. B. SPAULDING has resigned as superintendent of El Cubo mine, at Guanajuato, Mexico.

H. R. PLATE, of Denver, is examining mines at Georgetown, Colo., for New York people.

PERCY WILLIAMS has returned to Red Rock, Ariz., from examination of mines in California.

H. L. BROWNE is superintendent San Diego mine, near Santa Barbara, Chihuahua, Mexico.

GEORGE D. KISLINGBURY returned to Los Angeles from Cucurpa district, Sonora, Mex., last week.

A. W. WARWICK has returned to Denver from the Los Angeles mine, at Mina, Chihuahua, Mexico.

GEORGE A. TWEEDY, of Los Angeles, is examining the Bradbury mines at Rosario, Sinaloa, Mexico.

R. S. BOTSFORD has returned to London from Borneo and will proceed shortly to Ashanti, West Africa.

A. C. DART has been appointed engineer for the Newhouse Mining & Smelting Co., at Newhouse, Utah.

FORBES RICKARD has returned to Denver from Pittsburg and Chicago and will leave shortly for Arizona and Sonora, Mexico.

ARTHUR L. WALKER, manager of the Perth Amboy smelter, has arrived in San Francisco, and will remain here a couple of months.

JOHN M. CAMERON has resigned as superintendent Anita Copper Co., and accepted a similar position with the Growler Co. of Gila Bend, Arizona.

FRANK A. SCHRIMER, of Boston, has been elected president of the United Rico mines, at Rico, Colorado. A. B. Roeder was re-elected general manager.

WILLIAM P. BLAKE has severed his connection with the Arizona School of Mines, having resigned the chair of geology. He has resumed professional practice.

H. L. HUSTON has been elected manager of the Logan mine for the Ohio-Tonopah Mining Co., and Overland mine for the Overland Mining Co., with offices at Gold Hill, Nevada.

L. K. FLETCHER, until recently metallurgist for the Progreso Mining Co. of La Paz, has been appointed to a similar position with La Palma Mining Co. at Guatimapi, Durango, Mexico.

H. A. SHIPMAN has returned from Western Australia after an absence of three years. He arrived by the *Siberia* on January 26 and went Goldfield on February 2 to see the new camps in Nevada.

ALUMINUM.—No. 1, 99%, small lots, 33@37c. ℔ lb.; 100 lbs., 35c.; 1000 lbs., 34c.; ton lots and over, 33c., Pittsburg. No. 2, 90%, small lots, 34c.; ton lots and over, 31c, Pittsburg.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $18.50; gray forge, $17.25; San Francisco, bar, 3½c. ℔ lb., 3¾c. in small quantities.

STEEL.—Bessemer billets, Pittsburg, $26.00 open hearth billets, $27.50; San Francisco, bar, 7c to 13c ℔ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 8½c.; less than 500 lb., per lb., 8½c.; in 25-lb. tin pails, ½c. ℔ lb. above keg price; in 1 and 5-lb. tin cans, 100 lb. per case, ½c. per lb. above keg price. Dry Lead.—In bbl., 1 ton and over, 8c.; do. in kegs, 8½c.

LIME.—Santa Cruz, $1.35 country, $1.25 city ℔ bbl.

CEMENT.—Imported, $3.00@4.00 ℔ bbl.; California, carload lots, $1.80 f. o. b. at works; small lots, $2.10 ℔ bbl. in sacks, 4 sacks to bbl., 5c for each sack returned.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00;shingles, $2.50 for No. 1, and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $1.85; Cut, $1.75. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d, Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4d and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

GENERAL SUPPLIES.

ANTIMONY.—New York, per quality, 14c@15c; San Francisco, 1000-lb. lots, 14c; 300@500-lbs. 12c, 100-lb. lbs. 12c; 100-lbs lots, 13c.

BONE ASH.—Extra No. 1, 6c ℔ lb; No. 1, 5c½.

BORAX.—Concentrated, 9½c ℔ lb; powdered, 10c; fused, 25c; crystal, refined, 8c.

CANDLES.—Standard Oil Co.—Electric light, 16 oz., 11c; 14 oz., 9¾c; 12 oz., 8½c; 14 oz., 7¾c; Hotel, 12 oz., 9c; Granite (mining), 16 oz., 11½@11½c; 14 oz., 10@10½c; 12 oz., 9½@9½c; 10 oz., 8½c; Paraffines, White, 1s, 2s, 4s, 6s, 10½c; 12s, 11c; colored, 1c higher; Radiant Paraffines, 4s, 6s, 14 oz., 9½@9¾c; 10 oz., 7¾c.

CAPS.—3x, $5.50@6 per 1000; 4x, $6.50@7; 5x, $8@8.50; Lion, $9@9.50, in lots not less than 1000.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3¼c ℔ lb.; caustic soda, in drums, 3@3¼c ℔ lb.; Cal. s. soda, bbls., $1.10@1.20 ℔ 100 lbs.; sks., 90c@$1.00; chlorate of potash, 12@13c; nitrate of potash, 6¾@7c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2¼@2½c; flour sulphur, French, 2¾@—c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 6½@7c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66% B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

OILS.—Linseed, boiled, bbl., 56c; cs., 61c; raw, bbl., 54c; cs., 59c; Lucol oil, boiled, bbl., 48c; cs., 53c; raw-bbl., 46c; cs., 51c. Kerosene—Pearl, per gal., 17c; Astral, 17c; Star, 17c; Extra Star, 20c; Eocene, 19c; Elaine, 26c; Water White, in bulk, 10½c; Mineral Seal, iron bbls., 18½c; wooden bbls., 21c; cs., 24½c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 15½c, do., cs., 22c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 12½c; do., in cs., 19c; Lard Oil, E. W. S., bbl., 65c; cs., 70c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 53c.; Natural White, 68c; Bleached, do., 57c; Whale Oil, cs., 57c.

COAL.—San Francisco, coast, yard prices to dealers: Wellington, $7.50; Seattle, $6.50; Coos Bay, $5.50; Cargo lot, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $14.00; Cannel, $8.50; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $11.50 per ton in bulk, $13.00 in sacks; Sunnyside, $8.50, long ton.

BISMUTH.—Subnitrate, ℔ lb., $2.10.

CHROMIUM.—90% and over, ℔ lb., 80c.

FIRE BRICK.—Domestic, carloads ℔ 1000, f. o. b., factory square, $25.00; soap and split, $22.50; arch and wedge, $27.50; skewback, $30.00; circle, $32.00.

FIRE CLAY.—Domestic, ℔ ton 2000 lbs. in 125-lb. bags double, and dry ground, f. o. b., factory, $8.50.

FUSE.—Triple tape, $4.00 per 1000 feet; double tape, $3.55; single tape, $3.10; Hemp, $2.85; Cement No. 2, $3.10; Cement No. 1, $2.75, in lots of 3000 and up.

LITHARGE.—Pure, in 25-lb. bags, 9½@10½c ℔ lb.

MAGNESIUM.—Pure, N. Y., $1.60.

MANGANESE.—Black oxide, ℔ lb., 2¾@4c.

MERCURY.—Bichloride, ℔ lb., 77c.

MOLYBDENUM.—98@99% N. Y., $1.75 ℔ lb.

PHOSPHORUS.—American, ℔ lb., 70c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitroglycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1**, 50%, carload lots, 11⅞c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2**, 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

RED LEAD.—500 lb. and over at one purchase, ℔ lb., 8½c.; less than 500 lb., 8¼c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 54c.

SODIUM.—Metal, ℔ lb., $1.

TUNGSTEN.—Best, ℔ lb., 90c.

URANIUM.—Oxide, ℔ lb., $3.40.

The Carnegie Steel Company, Pittsburg, Pa., recently issued the following:

Schedule of prices which will be paid per ton of 2,240 pounds for domestic manganese ore: Delivered at Lucy Furnaces, Pittsburg, Pa., Edgar Thomson Furnaces, Bessemer, Pa., or South Works, Illinois Steel Company, South Chicago, Ill. Prices are based on ores containing not more than 8% silica and not more than .25% phosphorus and are subject to deductions as follows: For each 1% in excess of 8% silica there shall be a deduction of fifteen (15) cents per ton, fractions in proportion. For each .02% or fraction thereof in excess of .25% phosphorus there shall be a deduction of two (2) cents per unit of manganese per ton.

Metallic Manganese.	Per Cent.	— Prices per Unit — Iron.	Manganese.
Ore containing above	49	6 cents	30 cents
Ore containing above	46 to 49	6 cents	29 cents
Ore containing above	43 to 46	6 cents	28 cents
Ore containing above	40 to 43	6 cents	27 cents

Ore containing less than 40% manganese, or more than 12% silica, or .27% phosphorus subject to acceptance or refusal, buyer's option. Settlements are based on analysis of sample dried at 212° F. The percentage of moisture in the sample as taken being deducted from the weight. Prices subject to change without notice, unless otherwise specially agreed upon.

Trade Treatises.

Bulletin No. 1,019 B, of the Denver Engineering Works Co., illustrates and describes the use of rigid rolls for ore crushing.

The Denver Ore Testing & Sampling Co., 527 Seventeenth street, Denver, Colo., sends a neatly illustrated booklet describing the advantages of preliminary ore testing.

Bulletin No. 1,409, of the Allis-Chalmers Co. of Milwaukee, Wis., contains an excellent illustrated account of the construction and installation of McDougall roasting furnaces.

The Hendrick Manufacturing Co., Carbondale, Pa., have issued their initial catalogue to the general trade on 'Perforated Metals,' a creditable and comprehensive work of 60 pages. Copies will be sent on application.

The Western Gas Engine Co., 908-932 N. Main street, Los Angeles, Cal., have issued a very complete and fully descriptive catalogue, illustrated with numerous half-tone cuts, covering their Western gas engines. These engines are especially designed for Western use and for cheap Western fuel, securing the best results from California distillate No. 2. They range in size from 5 to 500 horsepower.

Books Received.

'Mineral Production of Western Australia,' Bulletin No. 16, by A. G. Maitland and C. F. V. Jackson, contains a summary of mining operations for 1904.

Commercial Paragraphs.

THE American Steel Dredge Works have their complete plant at Logansport, Indiana, in operation.

L. M. WARD, manager Denver office Crocker-Wheeler Co., is in Ampere, N. J., attending the managers' meeting of the company.

THE Denver Engineering Works Co. have opened an office in the Dooly Block, Salt Lake City. Mr. L. G. Bignell will be manager for this district.

THE California Ore Testing Works, of San Farncisco, are adding a tube-mill to their Bay street plant, preparatory to testing a carload of Montana-Tonopah ore, with a view of designing and installing a suitable reduction plant for that property.

L. S. PIERCE, 1653 Welton street, Denver, Colo., manufacturer of the Pierce Amalgamator, reports an order for thirteen 20-ton machines for the Robson & Carter lease on the Smuggler-Union mill at Telluride, Colo. He also reports orders from the Hellan Mining Syndicate, Cleaum, Wash.; Nevada Reduction Co., Dayton, Nev., and Reynolds & Lawson, Grants Pass, Oregon.

THE Allis-Chalmers Co. of Milwaukee, Wis., report having furnished the Granby Consolidated Mining, Smelting & Power Co., Granby, B. C., with a converter stand, complete, with hydraulic cylinder for operating; Frank W. Parker, Quartsburg, Idaho, with a five-foot Huntington mill plant, with steam power, and the Advance Thresher Co., Battle Creek, Mich., with zinc sieving.

Obituary.

R. S. ROBERTSON, who has been in charge of the development of the Annie Laurie claims at Eureka, Utah, was accidentally killed January 2 by falling down a shaft on the Brooklyn-Eureka ground.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market street, San Francisco, has official reports of the following United States patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING JANUARY 16, 1906.

810,365.—PIPE-WRENCH—Henry C. Barlow, Goldendale, Wash.
810,102.—BALING-PRESS BRAKE—Wm S. Bradshaw, San Jose, Cal.
810,260.—FENCE—Sullivan Bugby, Soldiers' Home, Cal.
810,105.—CLEANING COMPOUND—John Callahan, Seattle, Wash.
810,034.—CAN-FILLING APPARATUS—Antonio Cerruti, San Francisco.
810,036.—FOLDING-BED—John E. Chatem, Los Angeles, Cal.
810,045.—WINDOW-LOCK—Elias Etzenhouser and R. L. Morss, San Jose, Cal.
810,331.—STOPPER RETAINING AND EXTRACTING DEVICE—William L. Gallagher, Point Reyes Station, Cal.
809,939.—APPARATUS FOR RECOVERING PRECIOUS METALS—Edward J. Garvin, Portland, Or.
810,146.—COIL SPRING—Eli Hogan, Portland, Or.
810,163.—APPARATUS FOR PRODUCING PERFECT COMBUSTION IN FURNACES—Harry Luckenbach, San Francisco
810,167.—MACHINE FOR AUTOMATICALLY SEGREGATING, MEASURING AND DELIVERING MOLTEN GLASS—Walter D. Morrison, San Francisco.
810,304.—PIPE-WRENCH—Louis V. Remion, San Bernardino, Cal.
810,087.—CARBURETOR—Stephen P. Sanders, Cupertino, Cal.
810,175.—MITER-BOX AND SAW GUIDE—James M. Smith, Wengle, Cal.
810,093.—ENVELOP-SEALER—Lola O. Stassart, Portland, Or.
810,178.—RAILWAY-CROSSING—Richard N. Walton, Los Angeles, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS United States and Foreign Patent Agency the following are worthy of special mention:

INTERNAL-COMBUSTION ENGINE.—No. 809,614. January 9, 1906. Henry C. Holloway, Gilroy, Cal. This invention relates to improvements in that class of engines known as 'explosion' or 'internal-combustion' engines. Its object is to obtain a more perfect control for that class of engines which are known as 'internal-combustion' or 'explosion' engines, and in which the expansion of an ignited gaseous vapor acts to impel a piston within a cylinder, and this control is effected by admitting the medium into an independent chamber, wherein it is ignited, and in providing connection between said chamber and the cylinder, with a means for controlling this connection, and thus regulating the speed and power of the engine. It comprises a cylinder having passages at opposite sides, a piston reciprocating in said cylinder, automatically-controlled outlet and inlet valves through which the impelling medium is transmitted by the movement of the piston, a receiver and a combustion-chamber about the same, with a valve between the two and operating in a plane parallel with the piston, and a valve-controlled opening between the combustion-chamber and the working end of the cylinder.

WINDOW-LOCK.—No. 810,045. January 16, 1906. Elias Etzenhouser and Rosannah L. Morss, San Jose, Cal. This invention relates to a device which is especially designed for locking the sashes of vertically slidable windows to each other and also to the casing, so that the sashes may be locked either closed or one or both of them partially opened and rendered immovable when so locked. The invention consists in the combination and arrangement of parts by which the locking may be effected and in the various and necessary details of construction.

CARBURETOR.—No. 810,087. January 16, 1906. S. P. Sanders, Cupertino, Cal. This device comprises in gas machine construction the combination of a tank, a bell therein, a carburetor, a receiver connected with the carburetor, means to reciprocate the bell, an oil-well connected with the carburetor, and means to deliver a predetermined quantity of liquid into said carburetor, said well being of greater diameter in one direction than in the other, and said means for delivering liquid from said well into the carburetor including an elongated bucket supported intermediate of its ends and suspended from the bell, and trip means in the path of the bucket to effect its discharge.

BALING-PRESS BRAKE.—No. 810,102. January 16, 1906. Wm. S. Bradshaw, San Jose, Cal. This invention relates to a brake which is especially designed for use upon baling-presses, and for the purpose of letting the follower down easily when the power has been released. It comprises in a brake mechanism for baling-presses, a follower, a power sweep, intermediate mechanism through which power is transmitted to raise the follower, and a brake whereby the return movement of the follower is controlled, said brake consisting of a shoe, a swiveled yoke upon which the shoe is mounted, a rim eccentrically mounted upon the sweep column, and means for applying pressure to force the shoe against the rim. There are other details of construction combined and arranged to bring about the desired result.

EDITORIAL.

THE metal markets during the past week have shown a re-actionary tendency, and, while there is a firm undertone, prices have nevertheless drooped, because manufacturers have abstained from making purchases. No serious decline need, however, be anticipated for the present.

WITH this issue we increase our reading matter by two pages, finding that the space hitherto at our disposal prevented the publication of an adequate amount of matter pertaining to the various departments of mining engineering. We hope it will not be necessary further to increase the quantity, but we shall consistently aim to improve the quality, of the matter we publish in these pages.

THAT department of miscellaneous information entitled 'Concentrates' has long been a prominent and much appreciated feature of the MINING AND SCIENTIFIC PRESS. It is our intention to maintain it, and possibly to better it, as everything else worth doing is improved in the course of experience. This week we publish a note on the chemistry of mercuric and lead salts when added to cyanide solutions. It is in response to a query sent to us from one of our readers in Mexico, but it is worthy of the attention of cyanide experts, generally, because it was prepared by one of the best of their own number. Our readers are invited to send questions, especially such as, when answered, would be likely to promote the distribution of useful knowledge.

OUR London correspondent sends us another interesting letter. Among other matters he refers to an amusing example of Jungle finance, for 'jungle' is the name given to the West African department of the mining share market at London. In this case a company with a small capital secures an enormous tract of country and then proceeds to float subsidiary companies with plenty of paper and a minimum of money. These off-shoots of a parent mining company are called 'pups' in Australia, and, like any litter of small dogs, they are exposed to all the dangers of adolescence, some get drowned in watered stock, some get the mange due to a poverty of ore, while others come to violent ends in the course of risky promotions.

MANHATTAN is a good name for anything, whether it be a cocktail or an island inhabited by predatory financiers. It is mentioned often just now because the new gold mining district, which has been christened thus, promises to become important. While the depth of the prospecting shafts is only sixty to eighty feet, the ore is extremely rich—the kind of stuff that carries ounces to the pound. Born late, Manhattan gets the benefit of the experience through which its older brothers, Tonopah and Goldfield, have passed. A real estate boom treads close on the mining excitement, bankers get to work before surveyors have finished and saloons anticipate both, as is proper in a region so arid. It is a poor man's camp; that is, it is the place where poor men, unaided by capital or machinery, may hope to become rich by mere digging, plus intelligent energy. The two Manhattans, one in Nevada and the other sometimes known as New York City, provoke a contrast; we hope the new one will redress the balance of the old, and attain the fame of its namesake, whose inhabitants "see the Atlantic wave their morn restore."

SCRAPPING of machinery is nowhere exemplified better than at Kalgoorlie, in Western Australia. In the course of successive management the bonanza mines have been equipped with a great variety of machines and processes. There has been $4,000,000 spent on machinery at the Lake View Consols, of which there remains the present plant, valued at $600,000. At the Associated Mines there has been expended about $2,500,000, of which $500,000 is represented by the existing equipment. Much of this extravagance was due to the recklessness which accompanies a lavish production, and part of it was due to the refractory character of the ore, inviting new methods of treatment. As there are no foundries in the locality, the accumulation of scrap makes a big showing at Kalgoorlie, and serves as a constant reminder to mine managers that "it is better to be sure than sorry."

A READER of this journal, who sent two mineral specimens for determination to our 'Prospector' department, writes to say that a local assayer of good standing gave him returns of 36 per cent molybdenum in one case and 15 per cent in the other. Both specimens were sent to us and were clearly stibnite, the antimony sulphide, a mineral unlike molybdenite or any other molybdenum mineral. The same assayer found phosphorus, lead and vanadium in the two specimens mentioned. On these results there was a local mining excitement and the owners of the land were besieged with offers, all based on the determinations made by this supposed reputable chemist. It is too often a trick of irresponsible assayers to take advantage of the trust reposed in them by prospectors and to give fictitious results. All of us know of cases where such dishonesty has been eventually detected by sending pulverized brick or barren granite to make-believe assayers, who have found gold and silver where it did not exist. Such men should be exposed, they hurt the real business of mining, and they cast a slur upon an honorable occupation.

Professional Solidarity.

At a recent dinner in New York attended by engineers, the statement was made that the members of this profession were underpaid and would not do better for themselves until they learnt to speak more kindly of one another. This was mainly a reference to the recriminations and jealousies provoked by the conduct of the work on the Isthmus of Panama. There was too much of a tendency to join in aspersing the character of the men who had been attacked by an irresponsible press, and it was the duty of engineers to stand up for those of their own calling; there should be more *esprit de corps.* All of which is true, and we may as well apply it to our own people, the mining engineers, geologists and metallurgists. The characters of engineers are often discussed at clubs, on trains, and in other places where men congregate with the leisure for talking. Occasionally an individual gets rough handling, and less frequently he deserves it, but in the main the biggest harm is done by that faint praise which is the most damnatory and which is most calculated to injure the profession in the eyes of the business community. If a man is dishonest, dishonorable, or flagrantly incapable, the sooner he is labeled rightly, the better; the profession ought to be rid of him, and it usually does shed him sooner or later. But such cases are rare enough; we need more consideration for those who are not altogether successful or abundantly gifted; to these a kind word means a good deal. Most of us have needed encouragement at some time or another; most of us will want it again. Let us be proud of our profession and have a good word for all those who are doing their share in the great work of developing the natural resources of this continent.

Sectional Dredging Machinery.

In our last issue, we endeavored to stimulate a discussion on gold dredging by referring to the methods employed in testing ground by drilling. This week we publish the continuation of an article on this subject. Another important point in connection with dredging is the degree to which it is safe to sectionalize the heavy parts of a dredge. It is obvious that such sub-division must be a last resort. To sectionalize dredging machinery, the chief essential of which is strength, is like dividing a stamp-mill mortar where solidity is the first requisite. The ordinary dredge equipped with 5-ft. buckets employs a shaft and tumbler weighing together about six tons; the shaft, made of nickel steel, is 14 inches in diameter and is 8½ feet long, so that it weighs over a ton—usually about 2,500 pounds. Each bucket-base weighs 1,100 pounds, and even the pins are over a hundred pounds apiece. Obviously, to cut down the parts of such a machinery to the 250 or 350 pounds that a mule can carry, is a difficult matter. The tendency in California is to attain efficiency and economy by building the dredges enormously strong and big. There is a dredge at Folsom—treating 150,000 cubic yards per month—that has close-connected buckets of 13-ft. capacity and another 13-ft. dredge, but of the intermediate or linked bucket type, designed by Julius Baier, has been erected in Montana. Dredges such as these are beyond the transporting capacity of all the mules in creation. The ordinary and, as regarded nowadays, small ma-

chine with 3-ft. close-connected buckets is provided with an 8-inch shaft weighing 1,155 pounds and uses a bucket-base of 475 pounds. Even such a dredge could not be transported over mountainous country. To decrease the burden, the shaft could be worked into the tumbler casting, so that the weight would be distributed into thirds. The bucket-base is difficult to reduce, save by cutting in half, at big expense. This applies to the close-connected type; for a bucket and link dredge of 3-ft. capacity, a six-inch shaft would suffice and the weight would be one-half that given above. By using a built-up bucket-base instead of a solid steel casting each piece can be reduced to 150 pounds; with sacrifice of strength, of course. Such construction will require a pneumatic riveting machinery for assembling the parts. However, these are details beyond our province. We desire merely to stimulate intelligent discussion on the subject and we trust our professional friends will avail themselves of the opportunity.

Fine Grinding.

The contributions of Messrs. Bosqui and Doveton on this interesting subject ought to elicit further useful discussion. A few definitions or, at least, an agreement as to the precise meaning of the terms employed, may prevent confusion. Mr. Henry Louis, professor of mining at the Durham College of Science, has suggested that we use specific terms to describe the various stages of grinding; 'breaking' to be confined to coarse breaking of crude ore; 'crushing' for smaller division by pressure or impact; 'grinding' for comminution by attrition. The idea of technical terms is not to invent new or bigh-sounding words, but to secure precision by giving individual words a particular duty. 'Re-grinding' and 'sliming' are often used interchangeably, but they do not refer to an identical process; re-grinding is an intermediate operation which often precedes the final reduction to slime. Two separate products are made sometimes, as in the cyanidation of silver ores, in the two operations referred to; in other cases, only one product is obtained by a two-stage process. As to 'sand' and 'slime,' we have had a good deal of clever dissection of these terms; the last word of precision was said when slime was defined, by Mr. A. W. Warwick, as a colloid hydrate; but this is the chemist's, not the millman's, point of view. To the millman, 'sand' and 'slime' express a condition and not a theory. Formerly a product of extreme pulverization, so finely comminuted as to be unleachable, was called 'slime.' But we have changed all that; filtering has been so developed that solutions can be forced through material once regarded as impermeable, and slime is wilfully made because the extreme subdivision of particles which it represents is favorable to quick solution in the presence of certain chemicals, such as potassium cyanide.

Slime is no longer an unleachable product. We have returned to the old definition which depended on sizing, and for the moment the arbitrary limit is 150-mesh, simply because that degree of comminution is found by practice to give the best results in the presence of two economic factors, the cost of reducing the size of the particles and the time required for solution of the precious metals. Unless made sufficiently small, the cyanide cannot get at the gold encased in the quartz. Meanwhile 'sand' continues to be the granular product, with sharp edges, readily percolable by solutions. The tendency is to decrease the proportion of this product by re-grinding it to the consistency of slime. Such 'sand' when re-ground to 150-mesh is not 'slime' in the eyes of a microscopist, because the particles are sharp, they are not colloid; but the cyanide expert, who knows all these things, will call this product 'slime' just as much as the clay or mud produced in the first instance from the soft aluminous or feldspathic constituents of the ore. It is 'slime' to him because he gives it the treatment allotted to slime. In other words, 'sand' and 'slime' are two mill products; they are not based on nice chemical or physical distinctions and they serve their present purpose. Anything finer than 150-mesh is slime, anything coarser than 100-mesh is sand, anything between is an accidental by-product. Being based on no true scientific distinction, we expect to see these terms discarded as cyanide practice becomes further developed.

The Debris Problem.

The California Miners' Association is to be congratulated on the effective work done by its president, Mr. Alfonso A. Tregidgo. A copy of the resolutions adopted at the Nevada City convention, in relation to the reclamation of the swamp and overflowed lands by the deposition upon them of the debris made in the course of hydraulic mining, was forwarded to the President, with the request that the Director of the Geological Survey be invited to interest himself in the matter. The response from both has been most cordial and effective. Mr. Tregidgo has received a copy of a report prepared by Mr. C. E. Grunsky, Consulting Engineer of the Reclamation Service. Mr. Grunsky's long experience and thorough acquaintance with the problem in hand gives his views especial weight. His report is strongly endorsed by Mr. Charles D. Walcott, the Director of the Survey, who states that he considers "it would be timely for Congress to adopt a definite general policy of dealing with drainage problems, in order that means may be provided for extending aid where the same is asked for. No satisfactory solution of these problems will be reached unless the work is undertaken by Federal or State Governments." We publish Mr. Grunsky's report in full on another page, for it will prove of great interest to many of our readers, and it marks a great step forward in the solution of a vexatious problem.

The report shows the inadequate results obtained from attempts made on a small scale, by private interests, to reclaim submersible lands along the larger rivers and the impossibility of securing harmonious action among land-owners on a broad scale. It is recommended that the Federal Government show the same consideration for rivers that lie entirely within a single State, such as the Sacramento, as it has shown for those that are inter-State streams, like the Mississippi. The Reclamation Fund is not available for work of this character and special enactment by Congress will be necessary. If then the Federal authorities are put in charge of the work, a comprehensive project would include the delivery of mining debris upon the basin-lands of the Sacramento valley. Furthermore, the California Miners' Association passed a resolution asking the Director of the Survey to prepare a topographic map, to facilitate the selection of localities suitable for the deposition of debris. In return, Mr. Tregidgo has received a map whereon he is asked to mark the portions to be surveyed.

All this is most cheering to those who have a sincere desire to see a settlement of the wasteful feud between the mining and agricultural interests of a State where both mining and agriculture are basic industries, as has been emphasized all along by our best citizens, and notably by Professor S. B. Christy, to whose initiative the present promising conditions are largely due. We do not wonder that Mr. Tregidgo is highly pleased, as shown by the letter which will be found following Mr. Grunsky's report, for he has accomplished a great deal, with the assurance of far-reaching results in the near future. It was the ease with which the Federal authorities were able to condemn land for the purpose of deepening the channel between Vallejo and Mare Island, that suggested the application of similar methods to the impounding of the debris from the mines and the diversion of the slime to the swamp lands. It is obvious that the reclamation work which aims at bringing water to arid regions, possessed of a soil that needs only the beneficent prompting of sufficient moisture, should include the rescue of inundated tracts which need less water and more soil. Meanwhile other good work is being done toward the same end, including an investigation of the agricultural value of the slickens, under the auspices of the Reclamation Department, and at the same time Mr. G. K. Gilbert, of the Geological Survey, is making experiments in the transporting power of waters for the distribution of sediment. All that is needed is the display of public spirit on the part of both miners and farmers, an acceptance of this way out of the wretched tangle that has grown over the quarrels of the last fourteen years and the application of good sense to the solution now offered. Whatever the result, the California Miners' Association is to be congratulated heartily on the service already done to the State.

By the Way.

We continue the observations of Sir William Huggins, on the influence of modern science upon the life and thought of the world. In this part of his address he deals with education, in its broadest sense, as widening the outlook of the individual, and fitting him for citizenship.

Elementary science, taught practically, with the aid of experiment during a boy's early years, cannot fail to develop the faculty of observation. However keen in vision, the eyes see little without training in observation by the subtle exercise of the mind behind them. From the humblest weed to the stars in their courses, all nature is a great object lesson for the acquirement of the power of rapid and accurate noting of minute and quickly changing aspects. Such an early training in the simpler methods of scientific observation confers upon a man for life the possession of an inexhaustible source of interest and delight, and no mean advantage in the keen competitions of the intellectual activities of the present day.

Training in the use of the eyes develops, at the same time, alertness of the intelligence and suppleness of the mind in dealing with new problems, which, in after life, will be of great value in facing unforeseen difficulties of all kinds, which are constantly arising. Science, practically taught, does more, for, under the constant control of his inferential conclusions by the unbending facts of direct experiment, the pupil gradually acquires the habit of reasoning correctly from the observations he makes. In particular, he learns the most precious lesson of great caution in forming his opinions, for he finds how often reasoning, which appeared to him to be flawless, was not really so, for it led him to wrong conclusions. Further, from the constant study of nature, the student comes so to look at things as almost unconsciously to discriminate between those which are essential and those which are only accidental, and so, gradually, to acquire the faculty of classing the facts of experience, and of putting them in their proper places in a consistent system or theory. Are there any other studies, it may be asked, by which, in the same time, a young mind could develop an equally enlarged capacity for correct reasoning and acquire so wide an outlook? Yet, notwithstanding the immense intrinsic value of its teaching, science is but one of the studies which are necessary for a wide and liberal education. Intellectual culture, or, in other words, the whole mind working at its best, requires, besides the training of all its powers harmoniously by the study of nature, an acquaintance with many other kinds of knowledge, especially of human history and the development of human thought, and of the human arts. Humanistic studies and experimental science are equally essential, and, indeed, complement each other. Either alone leaves the mind unequally developed, and its whole attitude one-sided, and so produces a narrow type of mind, which is incapable of taking a wide view of even its own side of thought, and has but little sympathy with any subject outside it.

Improved methods of teaching the classical languages, which would permit of the beginning of the study of them at a later age, would leave ample time for an early training in experimental science, which must soon come to be recognized as an essential part of all education. In future, no grammar or higher schools should be considered as properly provided for unless furnished with the necessary apparatus for teaching experimentally the fundamental principles of mechanics, physics and biology. The pupils should have the use of a small astronomical telescope, and of microscopes for biological work. Such apparatus and instruments can now be purchased at a very small cost. Clearly, it is only by such a widening of the general education common to all who go up to the universities, before specialization is allowed, that the present 'gap between scientific students careless of literary form, and classical students ignorant of scientific method,' can be filled up, and the young men who will in the future take an active part in public affairs, as statesmen and leaders of thought, can be suitably prepared to introduce and encourage in the country that fuller knowledge and appreciation of science which are needed for the complete change of the national attitude on all science questions, which is absolutely necessary if we are to maintain our high position and fulfil our destiny as a great nation.

LODE-FRACTURES.—A late discovery in the Daly-Judge mine affords an illustration of how veins are formed in the depths of the strata, that do not now extend to the surface, as described lately by W. P. Jenney in the MINING AND SCIENTIFIC PRESS. It is related that the manager, John J. Daly, instructed his foreman, by letter, to crosscut south from a certain point on the 1,500 ft. level, in order to develop a known vein. Owing to a mistake, the crosscut was run north into a bar of quartzite at least 500 ft. broad, which in the upper levels of the mine had proved to be barren. After driving a short distance the vein of ore was cut, which was not represented by any fracture worthy of note on the levels above.

CONCENTRATES.

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and to give information dealing with the practice of mining, milling and smelting.

FOR many years the native silver found in the copper mines of the Lake Superior region belonged, by custom, to the miners discovering it, if they were working on tribute (leasing). Now the companies claim the silver, should any be discovered, as well as the copper.

HYDROGEN PEROXIDE is a good antidote for cyanide poisoning, but the remedy must be promptly and repeatedly applied at intervals of three or four minutes by injecting the fluid hypodermically. Use a 2½% solution. It is also advisable to wash out the stomach with a 2% solution of the same antidote. Very few cases of cyanide poisoning are reported. Men engaged in the business all know the danger, and it is only by accident that cases of poisoning occur.

AN inclined shaft sunk at an angle of 45° gains 70.71 ft. vertical depth in each 100 on the incline. Sunk at 60°, it gains 86.6 ft. vertical depth for each 100 sunk. The vertical depth gained by an inclined shaft varies as the sine of the angle at which the shaft is sunk below the horizon, and the departure of the incline from a vertical line falling from the collar of the shaft is as the cosine of the angle of inclination. Thus, an inclined shaft sunk 100 ft. at an angle of 60° gains a vertical depth of 86.6 ft., and departs 50 ft. from the perpendicular.

THE time for re-setting the carbons in diamond-drill bits cannot be pre-determined. The stones must be reset when they need it, whether 200 ft. have been drilled through or only 20 ft. Ordinarily, when the carbons have been properly set and are of good quality, 40 to 50 ft. of hard quartz should be drilled through without re-setting, and from 150 to 200 ft. of slate. A set of carbons for a 2-inch bit will cost at present prices about $1,000. The stones should be chosen with care by an experienced person, as there is considerable difference in them, both in hardness and freedom from cracks, and a consequent tendency to break up.

IRON pipe for mining operations is not a new thing in the West. In 1857 an iron pipe, 40 inches in diameter, was laid in Yuba county, Cal., near Timbuctoo, for hydraulicking. In recent years, where pipe of large diameter is required, that made of wooden staves has found successful application. The pipe line of the noted water system in Western Australia is of steel and 30 inches in diameter. It is nearly 400 miles long and was built by the Government at a cost of $15,000,000 to supply fresh water to the mines in the desert region about Kalgoorlie. The Homestake Company in South Dakota has laid several miles of vitrified pipe for conveying water.

ROUND mine timbers are usually sold in the West at a stated price for logs, or poles, depending on their diameter at the larger end. In some districts the price is 10 or 12c. per inch of diameter for logs over 12 in. thick and 16 ft. in length. In others the price is regulated by the supply and may be higher or lower than the figure first quoted. Green timbers sell for less than those which have been seasoned, and no logs or poles are accepted that have not been peeled, for these latter rot so quickly underground as to render them expensive at any price. Lagging (split) sells at 4 to 10c. apiece, ranging from 5 to 7 ft. in length, averaging 8 in. wide and 2½ in. thick.

TO ascertain the distance through which a body will fall (theoretically) during a given period of time, square the number of seconds of time and multiply by 16.08 ft., the distance through which the body falls during the first second. The acceleration of gravity is 32.16 ft. per second. An object dropped into the No. 5 shaft of the Tamarack mine, near Houghton, Mich., would require about 18 seconds to reach bottom, provided it met with no obstruction on the way. This shaft is nearly 5,000 ft. deep. In calculating such problems, due consideration must be given the resistance of the atmosphere, which will have a greater or less effect according to the form and specific gravity of the falling object.

A CONCRETE WALL may be built of good materials, and the concrete may be properly mixed and placed in the wall, but if the foundation or earth beneath is soft and yielding, the wall may not prove satisfactory, as, when any weight is placed on the wall, unequal subsidence is almost certain to result, with consequent cracks of the wall and displacement of machinery on structure placed on the wall. Where the underlying earth affords an insecure base the foundation should be broad and well made. It is often a good idea to lay a broad base of large broken rocks, finishing with smaller rock as a floor or base for the concrete, which will aid materially in giving a solid footing to the wall or foundation.

THE Supreme Court of California has held (Hooper *vs.* California, 155 U. S., 648-654) the following: "The right of the Legislature to regulate the transaction of business by foreign corporations in this commonwealth, or to forbid it altogether, is beyond question." It is the policy of the State to merely hold this power in reserve for the purpose of dealing at any time with objectionable foreign corporations, as there is no disposition to bar aliens who conduct a legitimate business within the State. In some instances foreign corporations lease their property to a local company organized for this purpose under the laws of California. Such local concerns are merely dummies, the original company deriving all the benefits, if any accrue.

IN the case of a location notice posted January 1, 1906, on a blacksmith shop situated on the dump of a crosscut tunnel, there is a reasonable doubt in favor of the locator, as he may yet begin work. Evidently this is a re-location, but whether by the original owner or by a stranger the information does not state. The locator (or re-locator) should post his discovery notice on the outcrop of the vein and not 200 ft. away on the blacksmith shop. He should also properly stake (or monument) his location, and it may be his intention to yet fully comply with the law. In some of the States the law requires stated work within 90 days of the date of location; but this, unfortunately, is not the law of California. If within three or four months this locator does not comply with the law as to staking of his claim, etc., the mine itself will then be subject to re-location, as it will then be evident it is not a *bona fide* location. Neither the State law of California nor the Federal law requires any other work than that of staking the claim during the year in which the claim is located.

THE so-called Steamboat Springs of Nevada are about six miles west of Virginia City and at the eastern base of the Sierra Nevada mountains, in a granite region. These springs come up through fissures in the rocks and all the waters are hot, some of them boiling, and clouds of steam may be seen issuing from them at any time, which gave the springs their name. Some of the springs deposit chalcedonic silica, others deposit carbonates of lime, iron, etc., and some deposit sulphur and cinnabar. Several attempts have been made to open a mine on the cinnabar deposit, but it has been found impracticable, owing to the heat generated by the scalding water. The Steamboat Springs have been regarded by some eminent geologists as affording an excellent illustration of how ore deposits generally are formed; but while this is doubtless true of that particular type of deposit, it is unfortunate that investigations have only been possible at comparatively shallow depth. Some years ago considerable cinnabar was mined in a superficial way at these springs and the ore reduced. Gold as well as cinnabar is being deposited by these springs.

THE attempt of miners to identify rocks in the field without knowledge of petrography is almost useless. Only typical rocks can be thus readily determined. Granite and syenite may look much alike. Rocks are classified according to the minerals of which they are composed, and the student must first learn to identify these several minerals unmistakably, and then learn the names of their association. Thus, granite is composed of orthoclase, mica and quartz. Should hornblende replace the mica, it becomes syenite, and the quartz is not essential. Should the feldspar be plagioclase, instead of orthoclase, the rock becomes diorite, and the mica is not necessary; and so on through an almost endless number of minerals, and differentiation in the names, depending on the addition or absence of certain minerals. Structure is also important in the determination of rocks—whether the groundmass is crystalline; coarse or fine-grained; composed of glass or not; showing fluidal structure, and whether containing good-sized crystals of certain minerals. The study of rocks is a branch by itself, a knowledge of which is not indispensable to the prospector, who must search for minerals regardless of their associations and environment.

THE Grand Canyon of the Colorado river is in Arizona, about 70 miles north of Williams, a station on the Santa Fe Railroad. It is about 6,000 ft. deep on the north side and about 4,700 ft. on the south side, the difference being due to the southerly dip of the sedimentary rocks which form the greater portion of the walls of the vast chasm. It is from 12 to 20 miles in width. The topmost stratum is of Carboniferous limestone. The bottom of the greater portion of the canyon is cut down into pre-Cambrian crystalline rocks. In some places lava flows ejected from vents on the Carboniferous platform, or in still later rocks, have flowed to the edge of the gorge and poured over the side into the abyss, a cataract of molten rock, which filled the canyon to a depth of about 400 ft. Through this accumulation of debris the sand-laden waters of the Colorado river has again scoured its way, cutting down once more into the underlying rocks. Ores of copper and gold are known to occur in the crystalline rocks at the bottom of the canyon, and in the limestone and quartzite near the bottom of the sedimentary series, lead-silver ores are found, but the topographic conditions are such that, as yet, little success has attended the efforts to mine in the Grand Canyon.

A DISTINCTION has been made by the courts between the right to enter openly and peaceably within the boundary lines of a previously located placer claim for the purpose of perfecting the location of a previously discovered lode, and the privilege of going upon the surface of the placer for the purpose of prospecting or searching for an undiscovered lode. The Supreme Court of Colorado says that while a stranger may enter a placer location for the purpose of locating a lode known to exist therein, he may not enter for the purpose of searching for a lode which he believes to exist therein, but the existence of which has not actually been proven. —Clipper M. Co. *vs.* Eli M. Co. (Colo.), 68 Pac. 289. Unless the lode be discovered before patent to the placer has been applied for, the lode is supposed to have been unknown. Where a lode claim adjoins a placer, and the owner of the lode desires to take up that portion of the lode which he believes to exist within the placer, in order to make a valid discovery, he should sink a shaft at the line separating the lode claim from the placer claim. If the lode exist at the line it is reasonable to call this a bona fide discovery of the lode within the placer, and if the owner of the placer claim has not yet applied for a patent to the claim the lode locator may stake his discovery of a lode within the placer.

MERCURIC SALTS re-act with KCy to form a soluble double cyanide:

$$HgCl_2 + 4KCy = K_2HgCy_4 + 2KCl.$$

Lead salts, added in excess to cyanide solutions, give a precipitate of basic lead cyanide, but when in small proportion the lead remains in solution, presumably owing to the formation of an alkaline plumbite (K_2PbO_2), by re-action with the caustic alkali present:

$$PbAc_2 + 4KOH = K_2PbO_2 + 2KAc + 4H_2O.$$

The most useful effect of these soluble lead and mercury compounds is the removal, in the form of insoluble HgS and PbS, of any soluble sulphides which would otherwise retard the solution of gold and silver, and which may even re-precipitate silver already dissolved:

$$K_2S + K_2HgCy_4 = HgS + 4KCy$$
$$K_2S + K_2PbO_2 + 2H_2O = PbS + 4KOH.$$

The double mercuric-potassium cyanide also acts as a solvent, attacking gold more readily than simple KCy; and this action is independent of the presence of oxygen, gold replacing mercury:

$$K_2HgCy_4 + 2Au = 2KAuCy_4 + Hg.$$

Silver is similarly dissolved. These re-actions have been amply verified. The action of mercuric-potassium cyanide on gold is the basis of patents secured by Keith and Hood; the latter also claims the use of lead as facilitating the solvent effect of cyanide solutions. De Wilde has a patent involving addition of lead oxide to cyanide solution. These compounds also influence precipitation beneficially if they remain in the solution up to the point of entering the zinc box, as in that case the lead and mercury are precipitated on the zinc, forming zinc-lead and zinc-mercury couples of high electromotive force. In this precipitation the zinc simply changes place with the mercury or lead, as is also the case when the zinc shavings are dipped in lead acetate solution.

THE Homestake mortar has become famous because it embodies special features, the chief of which is rapid discharge. This type of mortar is well adapted to Homestake ores, but of less value with some others. The original Homestake mortar weighed 5,400 lb., was 54¾ in. long, 54½ in. high; feed opening at the back, beginning 6½ in. below the top, was 24 in. long, 4½ in. wide and 7 in. deep. On entering the mortar it remained 24 in. long. At the bottom of the feed forming the continuation of the incline over which the ore fell into the mortar, was a lip 4¾ in. wide and 1½ in. thick, the purpose of which was to discharge the ore against the upper half of the stamp head. The lower edge of this lip was 15½ in. above the bottom of the inside of the mortar. The discharge opening was 15⅞ in. from the bottom of the mortar, outside measurement. It was 48½ in. long and 21¾ in. high, to admit of easy access to the interior of the mortar for placing and removal of shoes, dies, etc., and for cleaning out the mortar. The slot for the screen frame inclined outward at about 10° from the vertical. On the short sides of the discharge opening were channels to receive the screen frame, and the wedges to secure it in place. In all mortars it is important these side grooves should be cast flush with the discharge opening of the mortar. In many mortars the outer edge of this screen groove or channel project inwardly and thus reduce the size of the discharge opening from 1½ to 2 in. on each side, a material loss of efficiency, or capacity, in the mortar to discharge the crushed ore. The bottom, or bed, of the Homestake mortar was cast 7½ in. thick, the sides at the bottom of the inside were 3½ in. thick, the inside length was 50 in. and its width 10½ in. Discharge opening 8 in. above bottom and at that level the mortar had a width of 13½ in. The upper portion of the mortar was but three-quarters of an inch thick. The new Homestake mortars are heavier than that here described and somewhat larger in all dimensions, but the inside measurements are reduced to about the same as those above given by the insertion of steel plates, or liners, on all sides, to prevent the wearing out of the mortar. The advantage of these liners was early recognized and all well-planned mortars now have them, as they give a life of many additional years to a mortar, whereas, formerly mortars would frequently wear out in about five years with constant use. The placing of heavy cast-iron blocks beneath mortars is a new idea, not as yet generally in favor. It affords extreme rigidity, but is also said to be responsible for many broken stems.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy.

MINING ENGINEERS AND GEOLOGISTS.

The Editor:

Sir—The opinions expressed by Mr. W. H. Storms in the issue of January 20 deal to some extent with the function of the economic geologist in the matter of mining litigation. Mine owners are, unfortunately, occasionally subject to the expense and annoyance of litigation, especially under the extraordinary laws which govern the tenure of mining property in the western United States. The contestants sometimes deem it wise to employ geologists for the preparation of evidence. Fully recognizing the limitations of the geologist in mining practice, limitations to which I have previously had occasion to refer, I would nevertheless protest against the slur on the geologist implied in some of Mr. Storms' statements. The "famous" lawsuit referred to by him in which the occurrence of wulfenite crystals was urged to influence judgment on the case, would seem to be better described as "infamous" than "famous", if the character of the "noted geologist" may be taken as any index of the character of the suit. No reputable geologist would hold such an opinion as he outlines and no man of sense, geologist or not, would attempt to maintain it. Whoever did so would have little regard to his future, either as an honorable man or as a geologist.

One man may be limited by his experience and calibre to the position of the shift-boss; another by his temperament to the career of the geologist. All discussion of the subject, however, must assume that we do not pursue our vocations in defiance of the Ninth Commandment. If we do, our elimination, soon or late, from the fields either of commercial or scientific activity is certain.

What does Mr. Storms mean by the mining geologist? If he indicates by this term a man who is willing to serve a mining company in the way that many criminal lawyers take cases, formulating an opinion arbitrarily which shall be favorable to his clients irrespective of the merits of their case, I must protest that the conception is erroneous, for such a man is not a geologist, mining or otherwise, and could have no standing except in a community lost to venality. The economic geologist enters the employ of the contending party only when conscientiously satisfied that he can establish evidence for his employer in accordance with the tenets of his geological faith, and then fights valiantly to maintain and exhibit his belief. He is worthy of his hire, and whether his efforts result in victory or defeat, he oversteps the bounds neither of his privilege nor his integrity.

C. W. PURINGTON.

Denver, January 29, 1906.

ELECTRICITY VS. COMPRESSED AIR FOR MINE OPERATIONS.

The Editor:

Sir—I have read with much interest the letter of Mr. Edward A. Rix, stating the compressed air side of the above controversy, and I am glad indeed to have such a well recognized authority as Mr. Rix interest himself in this question. I regret, however, that my residence is at such a distance from San Francisco that this letter will probably not appear until several weeks after Mr. Rix's article, thereby putting me at a slight disadvantage and creating the inference that the delay was caused by my having to look up new data on the subject. Such is not the case, however, as it is only necessary to take Mr. Rix's article paragraph by paragraph in order to accumulate all the data that is needed for an adequate reply.

In the second paragraph of Mr. Rix's letter, one is led to believe that an electric rock-drill is some sort of toy, and can only be used in the same way that a 'baby air-drill' would be used. As a matter of fact, there are electric drills now on the market which have demonstrated beyond a doubt their ability to drill at the rate of from 2½ to 3 in. per minute in hard granite, such as is found throughout Colorado. These drills are designed to do the same work, in regard to diameter and depth of hole, that would be accomplished by an air-drill, using a 3-in. cylinder. Such an air-drill, however, would require at least 15 h.p. to operate it, while the electric drill will operate on not more than 2 h.p., or approximately one-seventh the power required for the air-drill. It is, therefore, evident that both are commercially economical, and it is now only a question of which will do the most work continuously for the least money.

The writer has before him a copy of a report, signed by the superintendent of a wellknown mining company, from which he quotes as follows in regard to the work accomplished by the electric drills used exclusively in his mine: "Twenty-five stands were made with the drill, drilling 1,258 ft. in 290 holes, breaking 1,056 cars of rock, making 143 ft. of headway in the main tunnel, at an average cost of $9.74 per foot."

The above amount includes absolutely everything that could go to make up the cost of driving a tunnel, including haulage, repairs, pay-roll, fuel, assaying, powder, and, in fact, all incidental expenses.

Another case which has come to my attention is that of a quarry using both electric and compressed-air drills. In this case an electric drill was working alongside of a 3½-in. compressed-air drill of standard manufacture. The air-drill made an average of 30 ft. per day, requiring from 15 to 20 h.p.; the electric drill made 27 ft. per day, requiring about 2 horsepower.

It is possible to cite numerous other cases of a like nature if space would permit, but I believe that these two are sufficient to demonstrate my contention that a modern electric rock-drill will do practically the same amount of work as a compressed-air drill, while requiring but one-seventh the power. Of course, I am not at liberty to publish here the names of the mine and quarry in which the above records were made, but I shall be glad to convey such information to anyone taking the trouble to communicate with me.

It seems to be exceedingly difficult for compressed-air men to stick to the subject under consideration. You published an article by E. F. Schaefer, giving another view of the matter from the compressed-air standpoint. In this article one is given the impression that it is always necessary to generate electricity at a long distance from the mine. Mr. Schaefer then goes on to show the increased cost in installing dynamos, rotary converters, static transformers, etc., for the handling of high-tension current, and compares this with the cost of installing a compressed-air outfit in the mine itself. He does not say how much it would cost to transmit compressed air to the same distance as the high-tension current.

In order to make a fair comparison, I have prepared the following figures:

COMPRESSED-AIR PLANT. FIVE DRILLS.

Air required = 542 cu. ft. per min.
Horsepower required to compress this air to 80 lb. = 98.

Cost of a straight-line steam-driven air compressor of 600 ft. capacity	$2,000
Five 3½-in. drills and accessories	1,450
Air-receiver, 42 in. by 10 ft.	130
Incidental fixtures	50
1,000 ft. of 4-in. wrought-iron pipe	280
125 h.p. portable boiler	1,200
	$5,110
In case a two-stage compressor were used, at least $500 should be added	500
Making a total of	$5,610

The water rate of the above compressor would be 45 lb. per i.h.p. hour, approximately.

Allowing 9 lb. water evaporated per pound of coal, the coal used per hour would be 490 lb., or, for 8 hours, 4,020 lb. With coal at $4 per ton, the fuel cost of running this compressor 8 hours would be $8, approximately.

In the case of an electric-drill plant, I am informed by a wellknown manufacturer that the following apparatus would be installed for operating five drills:

One 15-h.p. gasoline engine, dynamo and belting	$1,200
Incidental fixtures	50
Switch-board	70
Insulated weather-proof electric wire, No. 00, 2,000 ft.	200
Cost of five drills	3,120
Total	$4,640

The cost of fuel for this plant of five drills, with gasoline at 16c. per gal., is guaranteed not to exceed $2.50 per 8-hour shift.

By comparing the above figures it will be seen that the electric plant is of but one-sixth the power and operates at about one-third the cost, using a more expensive fuel. It must be remembered in this connection, however, that the electric plant provides for enough excess power to light the buildings and headings and to ventilate 1,000 ft. of workings. The installation cost is considerably in favor of the electrical equipment.

Mr. Rix states that compressed air is better adapted to intermittent loads than electricity, and cites the case of a hoist requiring 75 h.p. at the peak, and which does not aggregate for the 24 hours 10 h.p. Mr. Rix contends that if the hoist was operated by compressed air, the compressor would be driven by a 40 h.p. electric motor, the air being stored in proper receivers during hoisting intervals, and the management paying for 40 h.p. instead of 75. This is certainly true; but I think that if an adequate electric-power plant be installed, the hoist could be operated by a single 75-h.p. electric motor, which would only be using power when operating, and that the whole outfit would be less expensive to instal than the apparatus advocated by Mr. Rix, that is, adequate electric-power plant, 40-h.p. electric motor, 35-h.p. air compressor, proper receiver, fittings and a 75-h.p. air motor.

In regard to what Mr. Rix says about the use of good lubricating oil in air compressors, I recently visited a shop in Ohio, where the management was using a low-grade oil for lubricating the cylinders on their air compressor, and they did not know that they were doing anything wrong. It could hardly, therefore, be termed 'criminal' of them, as they did not know any better, and from my experience I am convinced that there is hardly a subject in the mechanical field upon which the average engineer or superintendent possesses so little knowledge as the proper care and management of air-compressing machinery. It would seem to be far more 'criminal' to run even a slight risk of supplying impure air to mine operators when, by the installation of electrical drills and electrically operated blowers, pure and fresh air could be supplied, leakage losses obviated, and the mine operated at a minimum cost.

I must take exception to a statement of Mr. Rix that electricity is more dependent than compressed air upon the courtesy of steam. I believe that any power which can be used for compressing air can also be applied to the generation of electricity, be it Pelton wheel, steam or gasoline engine; in fcta, for mine installations a producer-gas plant, with electrical units driven by a direct-connected gas-engine, forms the most economical motive power which may be obtained. Requiring but one-third the power needed for an air plant, such an equipment can be transported anywhere, as a much lighter engine can be used.

I recognize, of course, that compressed air is adapted to many purposes where electricity can not now be used, such as operating hammers, riveters, and other shop conveniences, but I am convinced that in mines, quarries, etc., electricity will make tremendous strides within the next few years.

W. R. HULBERT.

New York, January 27, 1906.

Mr. Hulbert's quotation of work done by a certain mining company would be more effective if the name, place, and character of rock were given. Nine dollars and seventy-four cents per foot is nothing to boast of, unless the ground was exceptionally difficult. We have had charge of mines where drifts and crosscuts were run for months at a time for $3 to $3.50 per running foot. All quotations of specific performances are strengthened by giving details of name and place; the quarry work described by Mr. Hulbert is interesting, but it is of little value in an argument until someone accepts definite responsibility for the statements. If Mr. Hulbert is not at liberty to publish the names, how is he justified in giving them to anyone who writes to him? It is a discourtesy to the readers of this paper, before whom he is carrying on this debate with Mr. Rix and Mr. Schaefer. As to the criminality of using bad lubricating oil, we engineers have agreed long ago that ignorance of rudimentary facts does not excuse bad work; managers are supposed to know how to safeguard the lives and health of the men in their employ, and if they do not know such an elementary fact as the danger of using low-grade oil in air-compressors, they are unfit for a responsible position.—Editor.

FINE GRINDING.

The Editor:

Sir—I have carefully read the articles of Mr. Voyle and Mr. Doveton in response to my invitation to a discussion, and, judging from the manner in which they have treated the subject, neither gentleman seems to have grasped or realized the conditions obtaining in this branch of ore reduction. Both gentlemen are, apparently, wedded to present standards and not disposed to admit the possibility of further improvement.

As Mr. Doveton speaks authoritatively on the subject under discussion, I assume that he will agree to the following propositions:

1. That coarse gold will take care of itself during its passage through the mill, either by amalgamation or other mechanical concentration, and, as these are the cheapest known methods for the recovery of that character of gold in low-grade ore, there is no necessity to devote further attention to it than is required to free it from its encasing rock and give it an opportunity to concentrate, either in quicksilver or in water.

2. That any gold, coarse or fine, still encased in rock, if not saved by either of the above methods, stands a pretty strong show of landing on the tailing dump unless subjected to further crushing to free it from its covering or, at least, expose some portion of each metallic particle to the action of whatever agent is to be utilized to accomplish its salvation—whether it be quicksilver, or some chemical or combination of chemicals.

3. That in order to totally separate the metal from its casing of rock, unless that casing is permeable by solvents, it must all be reduced in size to that of the most minute particle of metal.

4. That except in extremely rare instances where all conditions are favorable—that is, the ore itself penetrable by solvents; the gold easily dissolved; no appreciable silver content; and no contaminating or deleterious metallic accompaniment — there is no foundation of fact for any such average percentages of extraction as 95% to 97%, which some boast of accomplishing.

5. That, while there is yet, and always will be, room for improvement in the chemical sphere of ore milling, it is, all the same, far in advance of the mechanical branch, as regards efficiency. Perhaps I had better put it this way: That, we can, chemically, dissolve the gold in ore in a very few minutes when ore and gold are finely pulverized—all the gold, if all is liberated from the ore—but we cannot, completely, separate that same chemical solution at all, and only an insignificant portion of it as compared to the whole, in the same time it takes to dissolve the fine gold — a mechanical deficiency, pure and simple.

Mr. Doveton has stated that: "Of the number of

varying classes of ore I have had occasion to examine during my six or seven years' residence in the West, I have met but two or three instances where fine grinding gave an increased commercial extraction of the gold and silver content." Now, as we are after all the facts, or, at least, supporting evidence, and care nothing for assertions that have no foundation whatever, I wish to ask Mr. Doveton (1), what is meant by the term "examine," as used by him in above quotation? Does he mean that he subjected all or even a majority of the gold ores coming under his observation, during that time, to actual and exhaustive milling tests with both methods (fine and coarse sizing)? Or did he "examine" them only by laboratory methods? (2) Whether the ores in question, in a majority of instances, were what are termed gold ores in the sense that most mining men understand that term—eight or ten dollars in gold (if not all gold) to one or two dollars in silver? (3) Why does he hedge himself around with that glib term, "commercial extraction," instead of giving percentages of extraction and actual costs, so we can judge for ourselves regarding the commercial aspect of his operations? (4) From how many different mines did he take those "varying classes of ore?" (5) He says: "In most cases," etc., and it is our right to ask him, how many cases were there in all, approximately? (6) Quoting further, he informs us that: "It may be generally stated that, wherever careful classification is carried out, and absolutely free sharp sand is dealt with by percolation, results equally as commercially good will be attained from the sand as from the slime, though, of course, the treatment of the sand will require probably four to ten times as long as the slime." And it is pertinent to ask him, when did time cease to be a factor—a commercial factor, to use his own ammunition—in ore reduction? (7) If results from the sand will only be "equally as commercially good" as from the slime, are we not to infer that he means "as *profitably*," with present methods of sizing and filtering (by sizing, I mean fineness of division and not classification); and if some quick, cheap method of fine sizing can be devised, would there not be remarkable difference in favor of the fine and slime—in the profit sense? (8) Just as a common-sense, business proposition, would it not be more profitable—ignoring the question of tankage, etc., costs—if, instead of holding the sand in pickle four to ten times as long as is necessary to hold the slime, we were able cheaply to put the sand in condition to respond to the same treatment given the slime, and chuck them out as tailing at the same time? And does he assume that this can never be done? If so, why does he draw a limit to possibilities? (9) Coming down the line, I quote him further, in part, where he says: "In the somewhat rare cases in America in which fine grinding will show a greater profit than average crushing, sand and slime treatment, I am strongly in favor of the grinding pan as a comminutor." Now, regarding these "somewhat rare cases," how did he ascertain the fact of this rarity? Did he test all, or, at least a major part of all the gold ores in America, or know of their having been tested, or does he know that anyone else has?

(10) I shall quote but part of his reference to certain "excavating distributing and conveying" apparatus: "In a skilfully designed plant, sand may be moved from one vat to another, using the above machinery, for approximately one cent per ton, and the extraction and profits enormously increased." This is a most interesting fact, but let me ask him, upon what unit of daily output or capacity did he base such an estimate of per ton expense—was it 10 tons, 100 tons, or 1,000 tons? If upon the first number (10 tons), then on an output of the last number (1,000 tons) he should be able to cut down that one cent several small fractions and, like the Dutchman's bonanza, "split him in two in der middle again," so that the actual cost of handling the latter tonnage would not be worth charging up to expense account at all.

We have now reached the closing paragraph of Mr. Doveton's instructive and authoritative article, and I must quote it in full, because here is where he "puts us back where we belong," by making it plain enough for a basswood man to understand that a great majority of the gold ores of the world require a special process for every mining district, if not for every individual mine, and just how the right kind of a man goes about to reach a just verdict in such a case. He says: "As an instance of the fallacy of attempting to fit the methods of one country to the ores of another may be mentioned the case of Western Australian ores and those of Cripple Creek, Colorado. In the former case, fine grinding is distinctly necessary, to fit the raw ore for the highest commercial extraction, while at Cripple Creek an almost equally good extraction may be obtained at 30-mesh as at 200-mesh, either by bromo-cyanide treatment of raw ore, or by simple cyanidation of the roasted ore. As a matter of fact, a considerably higher extraction may be obtained on the roasted ore at 30-mesh than upon the raw ore, using bromo-cyanide at 200-mesh and finer. The ore in both the above-mentioned districts has points in common, that is, that much of the gold in the material from the lower levels of the mines is combined with tellurium." How deftly and tightly he clinches his points—an artist—in his way. But close inspection reveals the fact that, on this subject, Mr. Doveton lacks a stave or two of being a barrel. I desire to speak directly to Mr. Doveton from now on.

Mr. Doveton, does your illustration contemplate and comprehend and include *all* the *gold* ores of Western Australia and *all* the gold ores of Cripple Creek district? At a rough guess—judging from what I have read and heard in other ways regarding the mining area of Western Australia—I would compare it with the Cripple Creek area in the ratio of about 1,000 to 1.

Now, you are (as you intimate) familiar with all the ores in question and should not hesitate to describe to us the average character of gold ores of both regions and tell us why they are not responsive to the same methods of treatment.

In all your "experience gained in this country, the Australian colonies and Mexico," did you ever, by any possible chance, see two different gold-bearing ores that had *no* "points in common?" That some of the ores of Western Australia (judging from such descriptions as have come to my notice) do contain tellurides in slight proportions, is admitted, but that they are at all comparable, in that respect, I most emphatically deny.

Further, Mr. Doveton, did you ever, in the countries spoken of, see ores *identical* with the sylvanite ores of Cripple Creek, in all constituents, and in a geological or mineralogical sense?

Assuming experiments to have been made as you show them, why did not you, or the other Cripple Creek talent, give the 200-mesh stuff an equal show in a roasted condition?

Mr. Doveton, I, for one, will gladly welcome any suggestion from you that comes inspired by your desire to aid in the betterment of milling facilities, but I protest against the kind of aid you have offered. If you are in lack of a basic principle for study, with a view to accelerating and economizing in ore milling, why not take up the revolving-tube idea which Mr. Voyle has recalled? Or, as you evince a strong liking for the muller grinding principle in ore pulverization, you will find room for the exercise of your mechanical genius. Did it ever occur to you that the ordinary 'combination' pan has about 15 sq. ft. of grinding surface, yet at 70 rev. per min. it cannot, properly, grind to *any* size without screening and returning oversize? Surely it is susceptible of improvement, both as to character of work and capacity. Perhaps, though, you really do think fine grinding a mistake—except "in a few rare instances"—but I am still skeptical concerning the grounds of your unbelief—as expressed.

E. E. WANN.

Los Angeles, January 28, 1906.

ARTIFICIAL PUMICE STONE.—Consul-General Guenther, of Frankfort, reports a German invention by which artificial pumice stone is produced by a mixture of sand and clay. Pumice stone, aside from its use as a cleaning agent, belongs to the most important polishing substances. While emery is used for polishing tools, polishing paper for stone and glass, oxide of iron for fine glassware, and lime for metals, pumice stone is employed for polishing softer articles. Pumice stone as found in nature is, according to its composition, nothing but lava which has received its foam like porosity through the fact that the volcanic stone substance was cooled very rapidly under strong development of gases. Natural pumice stone, which, for industrial purposes, comes almost exclusively from the island of Lipari, is of little firmness, and for that reason experiments have been made for some time to find an artificial substitute of greater durability. This seems now to have been accomplished through a German invention under which artificial pumice stone is made by mixing sand and clay. This artificial pumice stone is made in five different kinds. The first is either hard or soft with a coarse grain and used for leather, waterproof garments, and for the felt and woolen industry. The second can also be supplied hard or soft. It has a medium grain and is mainly used for stucco and sculptural work, as also for rubbing wood before painting. The third is soft, of fine grain, and is recommended for polishing wood and tin. The fourth is of medium hardness and fine grain and gives to wood the right polish before being finished with oil. The fifth is hard and of fine grain and used for polishing stone, especially lithographic stone. The manner of using is the same as for natural pumice stone. For wood it is first used dry, afterward mixed with oil.

THE general composition of the crust of the earth has been calculated as closely as possible on the basis of known chemical analyses; among the elements given, only the following appear which are metals of importance as such in every-day life: aluminum 8.13, iron 4 71, manganese .07, chromium .01 and nickel .01. They rank, respectively, in the table, third, fourth, thirteenth, sixteenth and seventeenth. Of the five, iron is the only one of marked prominence. No one of the remaining four is comparable for usefulness with at least five other metals which are not mentioned, namely, copper, lead, zinc, silver and gold.

Mine Drainage at Joplin.

Written for the MINING AND SCIENTIFIC PRESS by W. R. CRANE.

The drainage of mines is not seriously considered until much water is encountered at considerable depth, and even then the influx of water must be excessive, or the mineral of low grade, to prohibit its ejection, with modern equipment, readily and at comparatively small cost. The drainage, for example, of the shallow workings of the Joplin lead and zinc region, would be a simple problem, were it not for several exceptional conditions, namely, the highly fissured condition of the formations and the extreme acidity of the mine waters.

The highly fissured condition of the quartz and limestone formations permits free ingress of surface water and an even more ready passage of underground waters, which may be set in motion by depressions in the surface of the water-level by an individual pumping plant or the combined pumping of a group of mines. The ease with which surface water can enter the mines is readily demonstrated by the rapid rise in level of the water in shafts and workings after a heavy and especially protracted rain-storm; also, a visit to a mine, the workings of which lie directly beneath the tailing pile of a concentrating mill, still further demonstrates, by the constant drip and drizzle, the ease with which the water can find its way to considerable depths and in a surprisingly short period of time. Careful estimates of the amount of water that enters the mine, from the concentrating mills alone, have been placed at fully one-third of the total amount there employed, and as, in many instances, the source of the mill-water is in the mine, it means an endless round of operations—pump to the surface, run back again and so on *ad infinitum*.

Further, mines situated along the valleys of rivers and creeks are usually dry until a rise in the stream carries it over the level of the sand-packed bed, when a general flooding of the mines results. It is a common occurrence to discharge the water pumped from a mine into a stream, only to raise the level of the water in an adjoining mine and ultimately have a good share return to the former mine. So thoroughly is this condition of underground circulation understood that it is customary, in those parts of the district where mines are closely grouped together, to install a pumping plant, the operator of which receives a royalty on every ton of ore mined. Centralized pumping plants are of common occurrence in the district.

As an instance of the flooding of mines situated in the valleys, or bottom of rivers and creeks, the condition of affairs on Short creek, at Galena, may be cited. Here many rich pockets of ore were discovered during the early days, but mining operations never extended deeper than 50 or 60 ft.; they were really little more than surface workings, owing to the periodic flooding occasioned by the creek overflowing its banks. There is little doubt but that much valuable mineral still remains in this locality, and close to the surface at that. Many attempts have been made to carry the water of the creek past certain properties in wooden flumes, but with temporary success only. Some years ago a flume was erected and was doing good service, when a railroad pile-bridge was built just above its mouth and diagonally across the waterway, which so obstructed the stream that when the first high water came, the bottom was flooded and the flume partly destroyed. Damage suits were instituted, but a compromise was made—the railroad reconstructing the flume, which is now in excellent condition, although the mines have not as yet been freed from water. See Fig. 1.

The presence of much pyrite in the ore, and often in considerable quantities outside the orebodies, is responsible, by dissociation and solution, for the acidity of the mine-waters. So extremely acid is the water of many localities that no metal or alloy can resist its ravages for any great length of time. Metal pumps, with copper, brass, bronze, and similar linings, have, at best, a life of only a few weeks or months, while the wire and perforated metal screens of jigs and trommels often last but a few days. Recently opened mines and new localities are, as a rule, not seriously troubled with acid water, but such a condition soon develops.

As indicated, the question of drainage is not simply one of removing the water from the mine, but also of removal to such a distance as to insure its not returning by an underground route to the mine. To conduct the water away from the immediate vicinity of the mines, pipes, launders and flumes have been tried, and in a few instances tank-cars have been employed. The question of a systematic and united attempt to put into effect a system of drainage has been seriously considered, but has not materialized.

Aside from the use of buckets and tanks, the Cornish pump was first employed to free the mines from water, and it may be considered as an important factor in establishing the operations upon a profitable basis. The low first cost of the Cornish

pumps, combined with their simplicity of construction, ease of installation, and adaptability, have been largely responsible for their wide and universal use. They are still the standard pumps of the district and will probably continue to be employed for depths not exceeding 300 feet.

The comparatively recent activity in deeper mining has shown the existence of much larger quantities of water than were encountered in the shallower workings, and, after increasing the size of the Cornish pump to what was considered the economic limit (16 in.) without getting the capacity required, the more modern steam-pumps were installed. Pumps of the Snow, Worthington, Gardner and Emerson types are now employed in the district, and, where the water is not too acid, they are giving excellent service at low running cost. Steam-pumps with 5 to 7-in. discharge pipes are common, while a 16-in. pump will shortly be installed on a property near Webb City. The capacity of steam-pumps ranges from 500 to 3,500 gal. per minute.

Centrifugal, belt, and various forms of rotary pumps are employed in shallow workings, and especially in maintaining the water supply of the mills. These pumps are especially subject to corrosion by acid water, owing to the gradual concentration of the acidity, due to evaporation in the impounding ponds, and, in spite of the employment of various kinds of metal linings for casings and rotary parts, they are of extremely short life, seldom more than 30 to 45 days, and often less. As a last resort, wooden casings were employed, the only portions of the pumps that are metal being the rotary parts and the stuffing-box bearings. Wooden column pipes are occasionally used, but have not proved a success, especially the metal-bound stave pipes, owing to the corrosion and breakage of the binding wires and bands.

Notwithstanding the drift in practice toward the more economically operated types of pumps, the Cornish pump must still be considered the standard pumping mechanism of the district, and although the surface arrangements, that is, the methods of driving, may be changed, it still remains the old Cornish pump of our forefathers.

Owing to the shallowness of the workings, only the single-stage or bucket form has been employed. That portion of the pump in the shaft consists only of a pipe which can readily be set in one corner or to one side, and thus occupy a small space. The pump proper is simply an extension of the column pipe and is commonly known as the 'working-barrel.' The separate parts of the pumping mechanism, from the extreme lower end of the system upward, are: The suction, which consists of the screen and sleeve (for extending the suction); the clock valve, at the top of suction pipe; the working-barrel, which is a section of pipe (usually of cast iron) carefully dressed within, or lined with a bushing, to insure a close fit for the lift-valve operating within; and the column pipe, usually cast iron, and in lengths of 5, 10, 15 and 20 ft. All joints are provided with gaskets and well bolted together, the whole being placed in the shaft and rigidly supported at the surface, and at as many other points as is deemed necessary. It is not uncommon to see as great a length as 150 ft. of pipe supported from the surface, the upper end of the pipe being supported by clamps and beams (See Fig. 3), while the lower end has a chain attached to it, which in turn is secured at the surface. The top of the column pipe is often expanded into a funnel, which flares out around the rod; large quantities of water can thus be introduced into the pump quickly for the purpose of priming.

Operating within the column pipe is a wooden rod, which is made up of lengths of pine timber, 4 by 4 in. or 6 by 6 in., usually the former. Connection is made between the ends of the sections of rods, as shown at A and B, Fig. 3, while connection is made with the lift-valve through the rod, C, which is commonly known as the 'spear' or 'snake.'

The rods are actuated by means of walking-beams, angle-bobs and cross-heads, all of which are in common use, although the walking-beam and cross-heads are preferred, especially the latter. Single pumps, actuated by a walking-beam, are widely used, and, where excessive quantities of water are encountered, double-beam or bob-pumps are often installed side by side, as shown in Fig. 2. The walking-beams of these two pumps are driven by the same engine, through a train of gears and belt. These pumps have been in service six or eight years, and, although the driving mechanism is considerably the worse for wear, they are still in commission and are doing satisfactory work, which is rather remarkable, seeing the scant attention that is accorded them. Working data for these pumps are as follows: Size of column pipe, 12 in.; length of stroke, 6 ft.; number of strokes per minute, for single pump, 12. The volume of water discharged by the two pumps filled a launder, 24 in. wide, 3 in. deep. The walking-beams are provided with counter-weights and are supposed to be balanced, but a casual observation of their working makes it apparent that, in most cases, the greatest expenditure of power is on the up-stroke, or when the pump is raising water, the engine racing between strokes.

Fig. 2. Double Walking-Beam Cornish Pump.

Within the past four or five years, the cross-head form of Cornish pump, sometimes known as the 'Neosho cross-head,' has been introduced, and is extensively employed at the present time. The advantages claimed for this form of rod-drive are: The rod is given, and maintains, an upright position and does not sway back and forth as in the walking-beam forms, thus necessitating long arms for the rod-supports, in order that the rods shall not rub against the column pipe; the reversal of the rod is quicker, thus permitting a larger number of strokes, which may, however, be a positive disadvantage if carried too far, a breakage of rods and spears will result, if the reversal is too quick; the small amount of space occupied, allowing one or more pumps to be readily placed side by side in the same shaft or compartment, and conveniently attached and supported by the members of the head-frame; and, lastly, ease of operation.

The balancing of a single pump is easily accomplished and, when two pumps are employed, they may be so connected as to counterbalance each other. The following is a brief description of a single counterbalanced, cross-head pump, and illustrates present practice in construction and method of operating such a pump in this district. See Fig. 3. The column pipe, with discharge head N, is supported at the top of shaft, on the shaft-collar, as shown at E; the rod R has the working-valve attached to it and is then lowered into the pipe until the valve enters the working-barrel, when it is set at the proper position with respect to the same. The upper end of the rod R is then clamped into the cross-head H, which slides up and down on the guide rods Z, which in turn are rigidly fastened to heavy cross-timbers, as shown at G. Attached to the cross-head, but on the side opposite the rod, is pivoted the pitman J, the lower end of which is connected to the crank L. The crank-arm has three holes spaced 6 in. apart, thus permitting an adjustment of strokes from 4 to 6 ft. Fastened to the upper end of the pitman J, by means of a wrought-iron strap S, bolted securely to the casting I, is a $\frac{5}{8}$-in. wire rope, which passes upward and over an 18-in. sheave F, thence downward to the weight M. The weight M acts as a counter-weight for the rod and friction of the moving parts of rod, cross-head, valve, etc. Three views of the cross-head (top, side and front) are shown at H, H_1 and H_2. The crank D is mounted upon a journal bearing a large spur wheel, often made 6 and 8 ft. in diameter, which is driven by a small pinion of 12 to 14 in. diameter, which in turn is driven by a belt from the driving engine. The train of gearing, which is known as the 'gear,' is mounted upon a heavy frame of timber and securely fastened to the same, and may be attached to the cross-head guide-support.

It is claimed that, when properly balanced, the pumps will run smoothly on 10 lb. of steam, although a pressure of 80 lb. is usually maintained, owing to the fact that the same boiler furnishes steam to both pump and hoisting engines. The cost of operating such a pump is rather uncertain, owing to the overlapping of different operations, as hoisting, pumping, tramming, etc. Further, it may be operated only a few hours a day and seldom requires the constant attention of an attendant. The operating expense is moderate, although not as low as for a steam-pump under similar circumstances. These pumps are readily dismantled and as readily assembled again, which is an important point, when we consider the uncertainty of the character of labor that must be depended upon. The cost of the pumps is slight, that of the metal parts seldom exceeding $50 to $75, and, as the timber-work is extremely simple, the total first cost is almost negligible when compared with steam pumps for the same service.

It is probable that the single lift, or bucket Cornish pump, will still continue to be standard in the Joplin region, especially where acid waters are found. It is interesting to note the modifications and improvements made to render these pumps more serviceable and efficient for the work in hand. Under existing conditions, it is doubtful whether a more inexpensive, simple and easily operated pump can be found to take its place.

Fig. 1. Flume at Galena, Kansas.

THE PROSPECTOR.

The mineral sample from Iowa Hill is calcium sulphate (gypsum).

The rock from Coffee, Cal., is apparently a much altered grano-diorite.

The ore from Seattle, Wash., marked H. A. I., is stibnite (antimony sulphide).

'The Prospector' cannot make determination of the sample from Paris, Kern county, Cal. It is simply pulverized quartz containing sulphides. 'The Prospector' makes no assays.

The mineral specimens from Leete, Nev., are: No. 1 is a silicious hematite, incrusted with the potassium iron silicate glauconite. No. 2 is a granular mixture of kaolinized feldspar and scales of chlorite.

The peculiar mineral from El Dorado, Cal., said to ooze from the rocks, and supposed by the owner to interfere with amalgamation, is a soluble sulphate of alumina and sodium.

The rock sample from San Francisco, marked 1,000, is rhyolite tuff, of no value, except possibly locally it might be used as building stone in structures of moderate height.

The rock from Waldo, Or., is an altered pyroxenite. The metallic-appearing mineral is pyrrhotite.

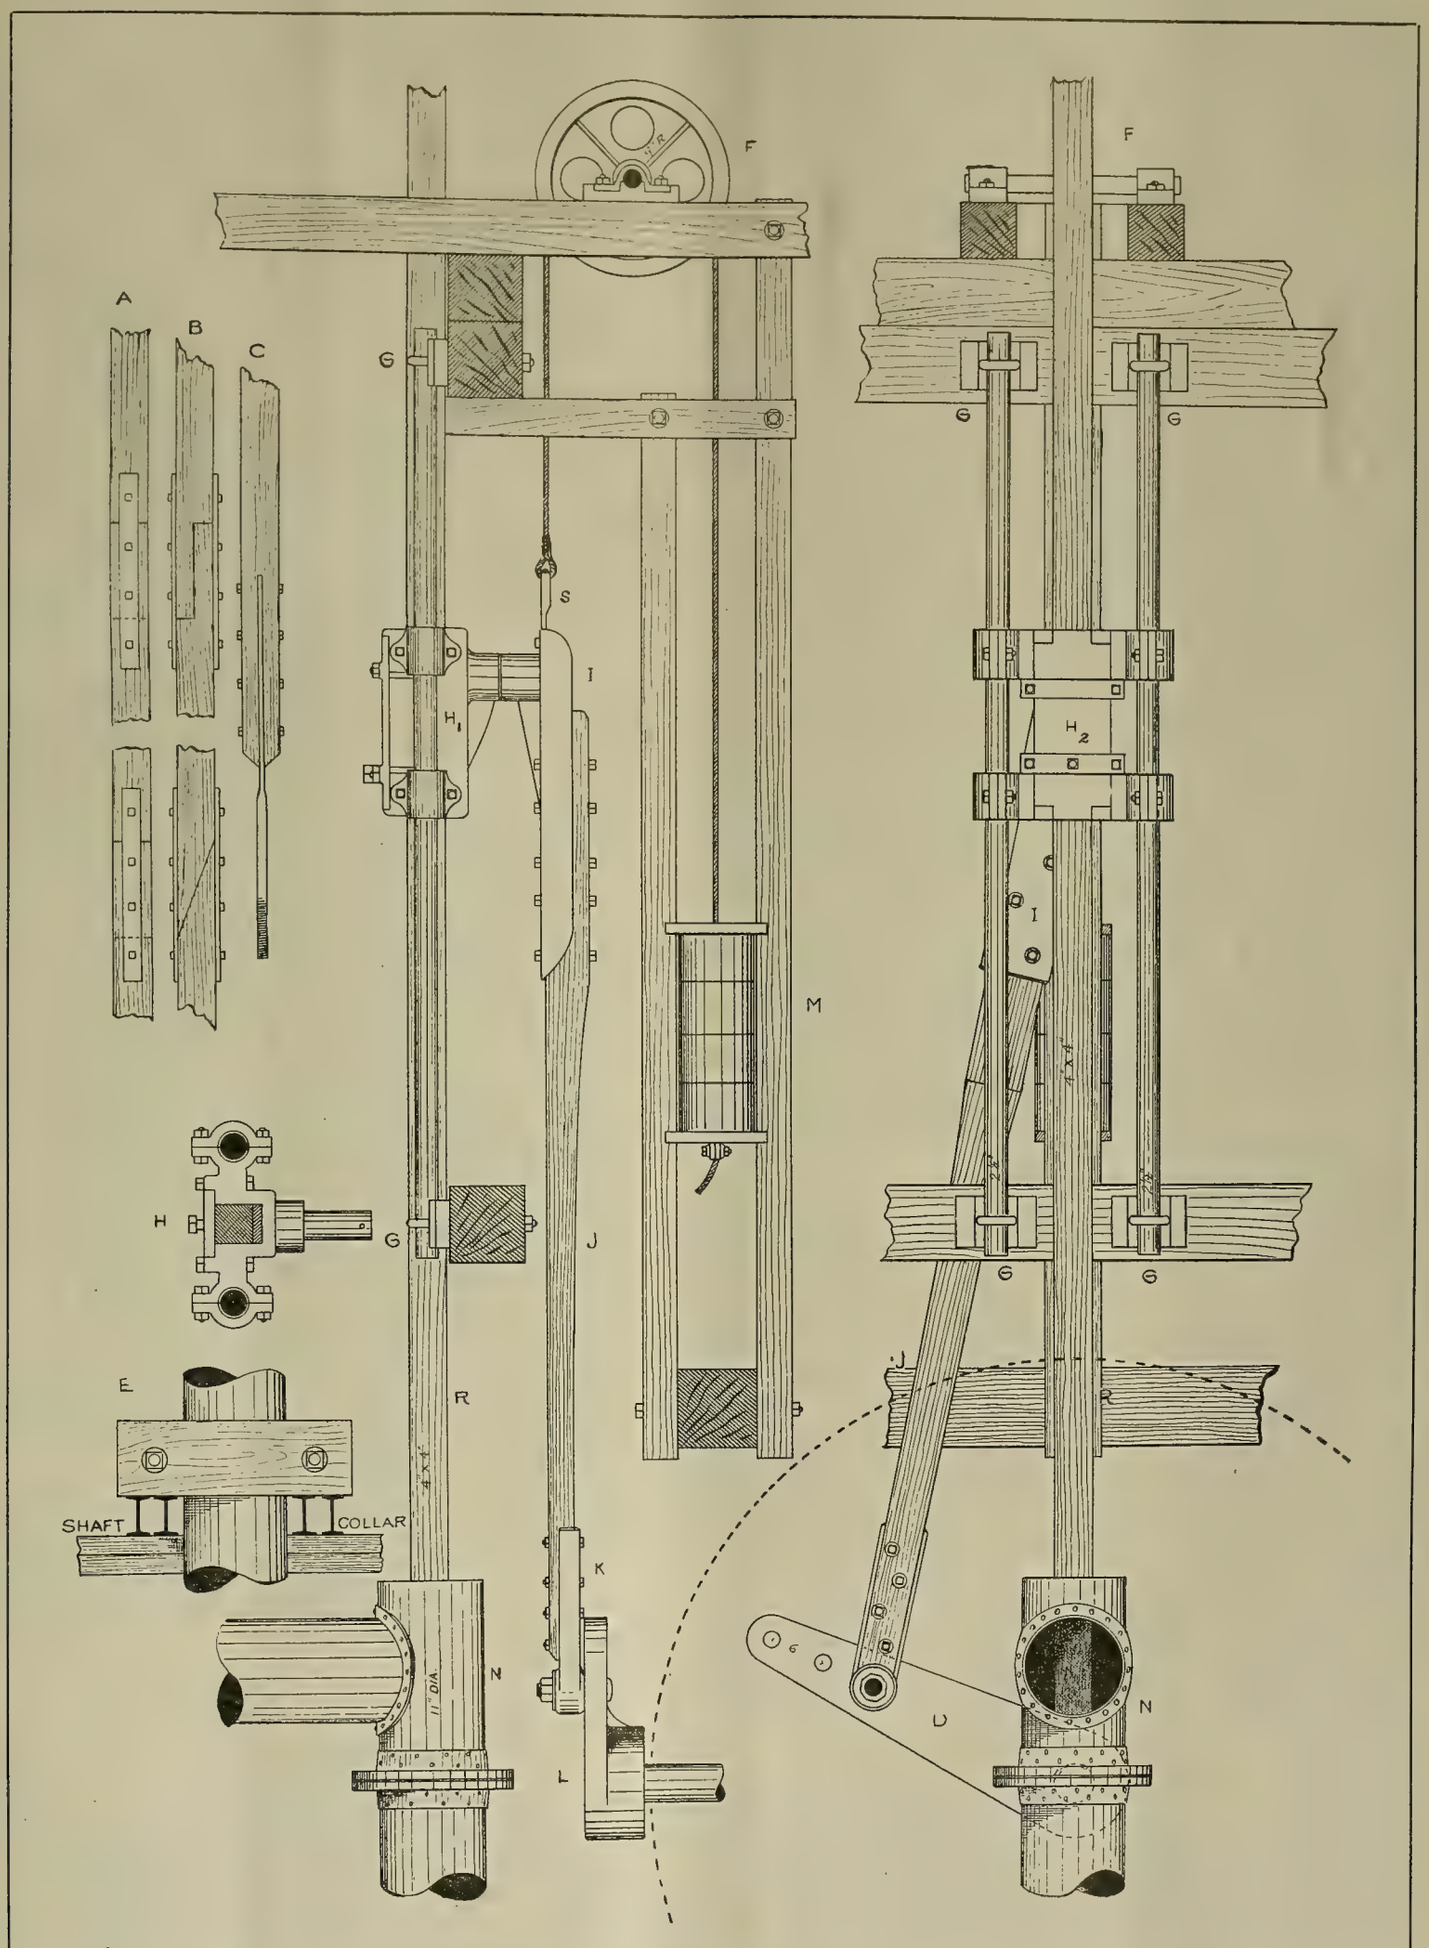

FIG. 3.—A CROSS-HEAD CORNISH PUMP.

The Debris Problem.

On our editorial page will be found a statement of the steps proposed to be taken to advance the settlement of this old trouble in California. Expectation of success is founded upon the goodwill of the President and the Director of the United States Geological Survey, with the co-operation of the Reclamation Service of the Government. The following is an important letter elicited by the President of the California Miners' Association, whose comment is subjoined.

DEPARTMENT OF THE INTERIOR,
UNITED STATES GEOLOGICAL SURVEY,
RECLAMATION SERVICE,
WASHINGTON, D. C., January 16, 1906.

To the Honorable Chas. D. Walcott, Director of the Geological Survey:

Sir — In response to your request for my views on the resolutions adopted by the California Miners' Association at its annual convention recently held at Nevada City, California, I desire to say that the swamp and overflow lands of the State of California were ceded to that State by the United States in 1850 for the purpose of reclamation. These lands in California, as in other States, were disposed of by private parties under laws intended to encourage their drainage and reclamation either by individual owners or by co-operation of owners under district organization when a number of tracts owned severally appeared susceptible of reclamation by one system of works.

Under these laws, attempts to reclaim lands along the larger rivers have been mainly directed to the construction of embankments or levees, which serve as barriers to the spread of the water. Protection work of this character has generally been constructed at the sole expense of land owners. Some State aid has been extended as in California, and in some cases, as along the Mississippi river, the work done by the United States has been a material feature of the land protection work. The measures thus far provided have led to only partial success. Proper attention has rarely been given to the drainage problems. The works for local benefit have gradually restricted the natural water-ways and submersible areas, and this reduction of water-way, which has in some cases been aggravated by other causes, has forced the flood plain above its original height and has added to the difficulty and expense of further land protection. This is the situation in California at the present time. The natural main drainage lines, though re-enforced by levees, are inadequate to carry the floods to the sea. Hundreds of thousands of acres are still submersible at ordinary flood stages, and other hundreds of thousands of acres, though in a measure protected, are subjected to dangers which make their cultivation possible only at a great risk. These lands are all privately owned. It is not a question of improving a part of the public domain.

Harmonious action by the land owners has in the past been out of the question, mainly due to the vastness of the areas which should be included in single drainage projects. Those who believe themselves favorably located prefer a partial protection, according to their own ideas and at their own expense, to a participation in one comprehensive project. Disasters have been so frequent under this system that efforts are being constantly put forth for relief. One project after another has been suggested, but thus far without satisfactory result. There seems to be no general agreement that the main difficulty lies in harmonizing conflicting ideas relating to the best course of action.

It seems reasonable that rivers, such as the Sacramento river, which lie entirely within a single State, should be entitled to the same consideration by the Federal Government, as the rivers, such as the Mississippi, which are inter-State streams, and it would be eminently appropriate and proper for Congress to adopt the same general plan of treatment for rivers of the former class, thereby aiding and facilitating the work of land reclamation.

The impression seems to prevail among the interested parties in the Sacramento valley that the United States may upon a further investigation undertake a plan of river rectification on a larger scale than contemplated in the past, which, while improving the navigability of the water ways in the Sacramento valley, will at the same time fit in with a general drainage product and materially reduce the cost thereof.

The view that further investigation, looking to a broader treatment of the question, is justified, led Congress to include in an Act approved March 3, 1905, the following:

"The Secretary of War is hereby authorized and directed to appoint a board consisting of three engineers of the United States army (one of whom shall have had experience on the Sacramento river and two on the Mississippi river) for the purpose of making a general examination of the Sacramento, San Joaquin and Feather rivers, California, and their tributaries, and of consulting with any engineers, commissioners or officers who have been appointed by the State of California to determine the method of controlling the overflow of said rivers and their tributaries, with a view of considering what, if anything, the United States can or should do in conjunction with said State to improve the navigation of said rivers and their tributaries, and the probable cost to the United States of such improvement."

The Sacramento Drainage district has been formed by legislative enactment, approved March 20, 1905. The law creating this district, in making provision for the assessment of the property in the district to meet the cost of works, proportioned by benefits conferred, conditions this assessment upon a contribution by either the State of California or the United States, or by both. By suitable authority "the proportion to be borne by said district and the State respectively of the cost of constructing and completing the works" is to be determined. No part of the district assessment "shall be called or collected until the State of California and the Government of the United States, or one of them, shall have made an appropriation or other legal provision for the payment of the balance of the sum to be expended jointly with said district in performing the work according to the plans recommended by said report of said engineers, or such supplemental, amended or other plan as may be approved by the State Board of Examiners." The report here referred to is the report of Engineers T. G. Dabney, H. B. Richardson, H. M. Chittenden and M. A. Nurse, filed with the Commissioner of Public Works of California on December 15, 1904.

Whatever is done by the United States or by the State for the amelioration of conditions as now prevail in the submersible areas adjacent to such rivers as the Sacramento river will result primarily in direct and material benefit to the owners of the land. It will result in indirect financial benefit to the State and to the United States, and in general benefit to the Nation, by adding to the resources of the country.

The report of the Board of Engineers which has been authorized as above stated may lead to an appropriation by Congress, which can be used in the construction of works for the improvement of drainage and navigation in Sacramento valley. If it does, and if by such means the drainage district is enabled to make progress along the lines marked out by the State law, there will be no call for Sacramento valley for such assistance in the matter of drainage as it is believed could, with benefit to all concerned, be extended, if Congress should pass laws for reclamation by drainage similar in their scope to the Reclamation Act.

But in the other event further aid from the United States will be sought—and the time will soon be at hand when a course of action in such cases must be definitely marked out.

A wise, sound and safe policy to be adopted by the United States in cases where land is to be reclaimed by drainage would be to assist:

First, by outlining drainage projects and supervising their execution.

Second, by advancing the funds required for the execution of each approved project, all money thus advanced to be returned to the United States Treasury in a series of years upon completion of the project.

Third, by waiving interest on money invested by the United States in such reclamation work.

The fundamental principle should be that the cost of reclaiming lands and protecting property from damage by floods should fall upon the land reclaimed and upon the property protected in proportion to the benefits conferred.

Action by the United States in any special case, if such a policy be adopted by Congress, pre-supposes request by the land owners for such action. No project should be carried out without a satisfactory pledge that the cost of the work will be returned to the United States within 20 years. Under such conditions as prevail in the Sacramento valley, the reclamation work by irrigation might well be united with that of drainage, but the work there would be of such magnitude and should be carried forward with such energy that the utilization of the reclamation fund for this purpose is entirely out of the question. This fund has already been allotted practically to its limits.

The attention of Congress might, therefore, with propriety at this time be called to the benefits which would result from a law substantially on the lines of the Reclamation Act, authorizing drainage projects to be examined and works for drainage to be constructed. Suitable provision should be made in such law for combining irrigation work with drainage so that comprehensive drainage and irrigation projects, similar to that for Sacramento valley, would come within the scope of the law.

It will then be for the property owners of Sacramento valley to determine whether, all circumstances considered, they should rely upon the district system for an amelioration of the drainage conditions, or whether they should conform to the prescribed regulations and requirements and let the work be carried out by the United States Government.

The Reclamation Fund, as above stated, is not available for work of this character, not even for preliminary examinations and surveys which must precede the approval of any project. In any law which Congress may pass to facilitate land reclamation by drainage, provision should, therefore, be made for setting apart a special fund to meet the cost of the reclamation works of approved projects.

If such a law be enacted, it should authorize the Secretary of the Interior to make necessary examinations and surveys, and should place at his disposal and make immediately available not less than $200,000 for this purpose.

If drainage works are to be carried out in Sacramento valley on the lines now approved by State authority under co-operation of the United States, the State and the drainage district, then at the proper time the problem of disposing of mining debris on some of the overflowed lands of the valley may properly be called to the attention of the engineers who pass upon the final plans of the required works.

If, on the other hand, Federal authorities are put in sole charge of the work, then the examination of any comprehensive Sacramento valley project would necessarily be extended to and would include all such features as the delivery of mining debris upon the basin lands of the valley. Very respectfully,

C. E. GRUNSKY, Consulting Engineer.

The President of the California Miners' Association sends us the following letter, commenting upon the above report:

Now, my mining and agricultural friends, it is evident that the one and only thing for us to do is to have a number of representative men from the valleys of the Sacramento, San Joaquin and Feather rivers, meet a joint number from our Association and settle on a united plan of action, so that our Senators and Congressmen at Washington may be able to act in conjunction with each other for the benefit of us all. It is further evident that the President is heart and soul with us in California, and it is for us to settle our difficulties at home, and then to ask the Federal Government for what appropriations we need, and he will assist us.

Further, that my humble opinion is that the Federal Government, having sold to the farmer his land, and to the miner his mine, should take care of *both* industries for the benefit of the miners and farmers directly and the State and Nation indirectly. And as certain overflowed lands, known as the Vallejo Water Front, owned by private individuals, have been condemned and purchased by the Federal Government for the purpose of deepening the channel between Vallejo and Mare Island—so should the Federal Authorities be put in *sole* charge of the drainage works of the Sacramento, San Joaquin and Feather River districts, and condemn and purchase such lands as their engineers recommend for a dumping ground for the mining debris from the mountains. The barrier is all right and will become stronger as it progresses toward completion. This will hold back the coarser debris from the gravel mines that deposit into the Yuba. It is in the watershed of this river that the most valuable gravel deposits at present known to exist are situated. It would be an easy matter to construct a canal capable of carrying the finer debris, such a canal to be taken out at a suitable point above the barrier, and depositing the debris on that portion of overflowed land recommended by the Government engineers for condemnation and purchase; at the same time, this canal could be paved with blocks, similar to those formerly used in hydraulic mine bedrock tunnels, and by the introduction between these blocks of sufficient quicksilver, the amount of gold saved would pay the biggest kind of interest on the money appropriated for the entire work of reclamation, drainage and barriers—no matter what the amount should be. Let the United States do this, and capital from all over the United States—aye, the whole world—will be forthcoming to enable the miners to repair the damage done by the enforced idleness of the hydraulic mines. California will soon double her gold output. The worthless overflowed lands will become fertile, and the Sacramento river will have ocean steamers running to Red Bluff.

Let us come together as soon as possible, and talk this matter over, say at Marysville. I ask for a committee to be appointed by the Valley to represent their interests and promise that our executive committee will immediately appoint a like number to meet them there to represent the mining interests. We will leave the number to the discretion of each side, the convention to be held not later than February 20.

ALFONSO A. TREGIDGO,
President California Miners' Ass'n.

San Francisco, February 5, 1906.

THE production of aluminum in the United States has increased nearly tenfold in as many years. Two reasons explain this phenomenal growth—economic production, which has initiated low prices, and increased consumption, especially in the electrical industry. The output in 1904 was 8,600,000 lb. When it is remembered that the industry dates its beginning from 1883, in which year the production was 83 lb. only, its rapid development will be appreciated. It was not until 1891 that the output reached 100,000 lb., but from that date the output has been phenomenal. Aside from the electrical industry, in which aluminum is gaining favor as a substitute for copper conductors for the electric transmission of light and power, there has been expansion in other directions. The steel industry has become an important consumer of aluminum.

Mining Methods—I.

Written for the Mining and Scientific Press by W. H. Storms.

One of the things that is noticeably characteristic of the successful mining engineer is his ability to adapt his methods to new and unexpected conditions. The methods by which mineral is extracted vary greatly, depending upon the character and size of the deposit; its position—whether vertical, flat or inclined; the topographical situation, and upon many other conditions, each of which has a bearing upon the economy of mining operations.

It is not my purpose at this time to enter upon an exhaustive dissertation of mining methods, but to refer briefly to mining practice in California.

In those districts where the veins are comparatively small, and the wall-rocks hard, as, for instance, at Grass Valley and Nevada City, the mining methods are like those used elsewhere under similar conditions, but in the Mother Lode region, and more particularly in that portion of it where the walls are slate—either one or both walls—peculiar structural conditions exist which require special methods.

On the Mother Lode of California—where the veins occur between walls of clay slate, or where one wall is of this character of rock—upon the removal of the vein, in shaft, or drift, or other cutting, the slate usually begins to exfoliate, as it were, and to swell, and if the encroachment of this swelling mass of rock is not relieved by cutting it away and removing the debris in cars, it will in time, and often in a surprisingly short time, fill the cutting completely. In some instances the slate is hard and apparently firm when the cutting is first made, but in from one to three weeks it begins to slowly thrust itself against the posts and lagging of the timber sets, and slabs scale off where not prevented by timbers, and fall into the drift. Nor can timbers, or any method of placing them, yet devised, hold this swelling ground in place. In some places the vein quartz is accompanied by slate which has been reduced by pressure and movement to a mass of fine foliated on pulverized material, commonly called 'gouge' by the miners. In character, this gouge ranges from a scaly, half-coherent mass to the consistency of putty or clay. Often the sides are clay-like and leathery, while the center consists of foliated scales, mingled with fragments of quartz and calcite, and occasionally with pyrite. Not infrequently, the entire fissure is found filled with this gouge material, the quartz being absent; but this portion of the fissure must be passed through, for the purpose of exploration or to reach orebodies known to exist beyond. In passing through such heavy ground, it is the practice to timber heavily, but it has been learned by costly experience that it is useless to lag the sets tightly, it being the better plan to allow ample space between the lagging, that the swelling ground may work through these open spaces and be picked away by miners detailed to look after this work. It has been found less expensive thus to relieve the pressure upon the timbers, preserving the main sets in alignment and preventing the breaking or crushing of the main members of the set. In this manner the expense of maintaining drifts, and other openings, is reduced. The method is applicable to both the sides and top of the drift, but where the bottom of the drift swells, raising the track from a few inches to several feet, as it frequently does, the only way the grade can be maintained is by cutting away the bottom of the drift and lowering the track to grade. In many instances this has to be done repeatedly, and it is not known to the writer that any limitation of this "continuous performance" has yet been reached on the Mother Lode in California.

Not infrequently the methods at present in vogue in this region appear not altogether the best that could be adopted. There is noticeably a constant conflict between the conservative policy of having development advanced sufficiently to insure abundant 'ore in sight,' and thereby assure continuous milling operations for a considerable period (ordinarily a wise and commendable policy), and the expense necessary to keep open a great length of drift, raise and stope, in this heavy swelling ground. Between these two elements in the economy of mining, the superintendents of some of the most important mines on the lode have fought the battle for years, but, even yet, there appears to be no general agreement as to what method is best adapted to existing conditions, and each manager attempts to "work out his own salvation" along the lines which his experience suggests is the most expedient under the circumstances.

The miners of the Mother Lode are not unprogressive; on the contrary, they are constantly on the outlook for that which will aid in their work, cheapen costs, and produce better economic results. Still, it seems possible that in some matters a change might be made in mining methods for the better—better, in that it would accomplish all that is at present being done, and in that it would probably lessen cost and also reduce the element of danger to the workmen.

How necessary it is to adopt some system of mining which will in the end be less expensive may be suggested by the knowledge, that in a prominent mine on the Lode a contract was let to drive a drift 200 ft. Experienced miners took this contract at what they considered a good price for breaking the ground and removing it, substantially timbering the excavation. They drove about five feet daily, but before two-thirds of their contract had been finished they were obliged to re-timber a considerable portion of that first completed, and the result was that they scarcely made day's pay, where they had anticipated not less than $6 per day. They knew what they could accomplish in a shift, and figured liberally, but entirely overlooked the probable necessity of re-timbering a goodly portion of their contract before it could be finished. They had never before assumed a share of the responsibilities of the superintendent.

In another instance a shaft sunk on the fissure, within three years from the time work began, had to be almost wholly re-timbered, and from four to six men are now constantly employed in relieving ground, wedging timbers into line, or replacing them, in this shaft; and, in nearly all the shafts sunk in the fissure, when in slate, on the Mother Lode, the superintendents have a similar experience. The two instances cited will render more clear the necessity for some change in mining methods, which will reduce the ultimate cost of mining on the lode.

Most of the difficulties of the managers in this region arise from the demand for prompt returns, on the part of stockholders, and an apparent abhorrence to pay for dead work—work performed in the mine not immediately productive of profitable results. This has led to the short-sighted economy of the present system of mine development and operation. It is only within recent years that shafts have been sunk in the country rock, instead of on the fissure, of the Mother Lode. The first large shaft to be sunk in the wall was that of the Argonaut, an incline now about 2,000 ft. deep. This shaft was started in the hanging wall, but at about 300 ft. cut the vein and continued in the foot-wall for nearly 1,000 ft., when the vein, in its changing dip, again intersected the shaft. The Oneida, the Kennedy, and the Gwin mine each have vertical shafts started in the hanging wall, and each of them, except that of the Kennedy, has intersected the vein in depth. The wisdom and ultimate economy of shafts sunk in the country rock on this lode had long since been demonstrated in the case of each of the several shafts above mentioned. In a few instances lateral drifts have been run in the foot-wall of the vein in some of these Mother Lode mines to avoid the expense of maintaining a gangway in the fissure, and in these instances also the economic advantage of driving drifts in barren country rock has been shown.

The several exceptions to customary mining practice have suggested the advisability of making a systematic change in the development of these mines, with a view to ultimate economy, although accomplished at somewhat greater initial cost.

Cyanide Sores.—These painful affections may arise from two principal causes; first, from dipping the hands or arms into cyanide baths to recover articles which have dropped into them—a very common practice and much to be condemned; and, second, from the accidental contact of the fingers or other parts of the hand, on which a recent cut or scratch has been inflicted, with cyanide solutions. In the former case, independent of the constitutional mischief which may arise from the absorption by the skin of the cyanide salts, the caustic liquid acts very freely upon the delicate tissue of the skin, but more especially upon the parts under the finger nails. We have known instances in which purulent matter has formed under the nails of both hands from this cause, necessitating the use of the lancet and poulticing. Again, when cyanide solutions came in contact with recent wounds—even very slight cuts or abrasions of the skin—a troublesome and exceedingly painful sore is sure to result, unless the part be at once soaked in warm water; indeed it is a very good plan, after rinsing the part in cold water, to give it a momentary dip in a weak acid pickle, then soak it for a few moments in warm water, and after wiping the part dry with a clean rag or towel, apply a drop of olive oil and cover up with a strip of thin sheet of gutta-percha. —A. Watt in *Electro-Deposition*.

Electric Furnace.—The future development of the electric furnace requires marked additions to our knowledge of refractory materials. The success of various existing furnaces and the failure of many others may be attributed to the quality of the linings, and the secrets which certain manufacturers guard are those which relate to the refractory construction. Much attention is, therefore, being directed to the study of materials capable of withstanding the highest temperatures without decomposition or fusion. Magnesia, which, where suitably shrunk, is perhaps the most refractory compound known, has received much attention, and we have been informed recently that magnesia in the form of tubes and other shapes may now be obtained.—Chas. F. Burgess in *Electrical Review*.

Origin of Klondike Gold.

There is little doubt that the Klondike gold is detrital in origin, and has been derived from auriferous quartz veins cutting the schists of the Klondike series. The veins are small and the number destroyed and concentrated as pebbles and boulders in the valley-bottoms is almost incalculable. The high-level 'white channel' gravels have a volume, on Bonanza and Bunker creeks alone, of nearly 500,000,000 cu. yd., and nearly half the deposit consists of quartz grains, pebbles and boulders derived from veins. This figure, large as it is, represents only a fraction of the vein material destroyed, as the volume of the gravels was originally at least a third greater, and a further allowance must be made for the large percentage of quartz ground up and carried away. The total production of the camp will probably approach $200,000,000; the average gold tenor of the quartz, therefore, did not exceed a few cents to the ton.

The derivation of the placer gold from quartz veins, as pointed out by Spurr in regard to the Fortymile district, is evident from the character of the grains. The greater part of the gold occurs in irregular flattened discs and bulbs similar to those in the veins. Many of the grains and most of the nuggets enclose quartz, and a few are themselves enclosed in quartz. Pebbles and boulders specked with gold are also occasionally found. A boulder from Bonanza creek, near Discovery, weighing 60 oz., contained 20 oz. gold. Additional evidence of the detrital origin of the gold is afforded by its worn character in the creeks, while the younger grains and nuggets found in the gulches are always rough and angular. The richest quartz, so far discovered, occurs near the head of Victoria gulch, a tributary of Bonanza creek. The partially decomposed slide-rock, which covers the surface of the hillside below the quartz outcroppings, contains colors of gold, and it is significant that Bonanza creek is rich below the mouth of Victoria gulch, and practically barren above. Victoria gulch is itself gold-bearing, and the gold obtained from near its head is sharply angular. It is not inferred from this that all the gold in Bonanza creek came from Victoria gulch, as none of the heavy gold has traveled far, and the valley was probably repeatedly enriched from veins along its course and from the older gravels; but that some of it was so derived seems certain.

While the greater part of the placer gold has been derived from broken quartz veins, a small percentage may have been precipitated from water carrying gold in solution. A boulder was found in one of the workings on Miller creek, the upper surface of which was partially covered with thin specks and scales of crystalline gold. The crystals were arranged in a dendritic manner. Some of them were firmly attached to the rock and others separated easily from it. The angles of the crystals were sharp and showed no wear of any kind, while the boulder itself, quartz-mica schist, was well-rounded. The gold evidently did not belong to the rock originally, and the only explanation of its occurrence seems to be that it was taken up by some solvent and re-deposited on the surface of the boulder. A number of thin specimens of nearly unworn crystalline gold, often dendritic in structure, have been found on Eldorado and other Klondike creeks, and they may have originated in this manner. The bulky, octahedral crystals (the common crystalline variety) were probably derived, like the nuggets, from veins. Several specimens of these have been obtained from the Victoria gulch quartz.

Quartz veins are exceedingly abundant in the schist of the Klondike series, and also occur, but more sparingly, in the Nasina schists and in the Moosehide diabase. The veins, as a rule, are small and non-persistent, varying in size from mere threads up to masses of quartz 100 to 200 ft. in length and from four to six feet in width. Large veins occur occasionally, one on the Yukon river, below the mouth of Cariboo creek, measuring over 30 ft. in width.

The common vein of the district is generally lenticular in outline, the lenticles, in the majority of cases, measuring only a few inches in width and a few feet in length. The larger veins swell out, in places, to five or six feet, but are seldom traceable for any distance. They follow the planes of schistosity, or cut them at a small angle. In some instances, while the strikes of the vein and the enclosing schist nearly coincided, the dips proved to be in opposite directions. Branching veins are not uncommon, the branches often cutting directly across the schists.

The metallic contents of the quartz veins present little variety. Iron is usually present in the form of pyrite and, less frequently, magnetite, often in sufficient quantities to give the vein a rusty color when weathered. Copper pyrite and galena, the latter sometimes argentiferous, occur less frequently, and free gold has been found in a number of veins, occasionally in considerable quantities. A short lens of quartz found near the head of Victoria gulch was studded at one end with numerous grains and small nuggets of gold, some of them well crystallized. The gold occurred mostly at or near the surface, very little being found in the interior of the vein. Small veins carrying grains of gold have been discovered on nearly all the producing creeks.—R. G. McConnell, *Geological Survey of Canada*.

The Prospecting and Valuing of Dredging Ground.

Written for the MINING AND SCIENTIFIC PRESS by NORMAN C. STINES.

(*Continued from page 70.*)

The Log-Book.—It is in the records that the engineer finds his data for valuing ground. The log-book as kept by different men varies, but for practical utility I have found the accompanying to be best; Table 1 is a page from a log-book as kept by a panner. All linear dimensions are in feet and tenths. At the head of the page is placed the number of the hole as drilled and the number as recorded in the transit-book. Following this is the name of the tract on which the hole was drilled. In column 'A' we have recorded the depth to which the casing has been driven. Everything on the same horizontal line as that refers to that foot in the section of the ground. This is measured by the machine-man and recorded by the panner. In column 'B' we have the depth of core after driving. This is a measure of the amount of material which has been forced into the pipe by the last drive *plus* the core left in the pipe before driving. It gives the panner an idea of the kind of ground to expect and occasionally it indicates the character of bedrock. In drilling ground in which the bedrock is volcanic ash (such as that at Oroville), a large core after a hard drive is a very good sign of bedrock. Its importance, however, lies in the fact that it acts as a check on the amount of material coming into the pipe. Column 'C' is also important. In it we can see if the bit has been below the casing and at what point. If we see that it has been below and has found an abnormal amount of gold for that pumping we can be sure that something was wrong—some gold has run into the pipe. In this hole the bit is never below the casing except after the casing has been driven 0.5 ft. into bedrock. The reason for this is that the machine-man is under orders to cease drilling while there is yet 0.3 ft. of core in the casing. There is only one reason for the bit to be below the casing; the ground is so *tight* or so coarse that the casing will not drive unless the ground is loosened below the casing. And in no case where the ground is drilled below the casing should the material be pumped before the casing is again driven deeper. This core is to act as a plug to prevent any material from outside the limits of the shoe from running into the casing. Its length will depend on the ease with which the ground runs. In sand a larger core is required than in gravel. The proper length of core to leave can only be determined in the ground itself and will vary not only for different holes but for different depths in the same hole. This must be regulated by the man in charge.

The length of core left in the pipe before driving should always be such that only the right volume of material will be forced into the casing. By the right amount is meant that amount which corresponds to the volume of a cylinder one foot long and 7½ in. diameter at the base. This amount, when forced into the pipe, should be somewhat longer than one foot, as it has been reduced at the base to a circle only six inches in diameter. This cylinder, to have the same volume as the one of larger cross-section, not allowing for the expansion due to the loosening of the gravel, would be 18.7 in. long, or 1.555 ft. But only in those cases where the ground is classed as 'very firm' does the length of core approach this value. (See column 'B' for the following feet: 15–19 and 27–30.)

In column 'D' is placed the core after pumping, and its importance in one way has been shown. Its further importance will be indicated later. In column 'E' is placed the depth of the hole. It is obtained by subtracting the core in 'D' from the depth of the casing as seen in 'A.' It is the least important of all, and is only retained as a convenience.

In column 'F' are recorded the estimated amounts of gold, which are classified as explained above and are reported by weight, not by number of colors. For example: 3^7 means that seven milligrams of No. 3 gold was found in that pan; 2^9 means nine milligrams of No. 2 gold and 1^{18} indicates 18 milligrams of the largest size were in the pan. This estimating of weights tells a great deal more than the mere number of colors. It is remarkable how expert a man will become in estimating the gold, especially in the smaller sizes. In looking at the log-book one can immediately tell how the ground is running and how many cents it will pan per cubic yard. Each milligram of gold per running foot means that that foot corresponds to ground of a value of 6c. per cu. yd. For example, in the 15th foot the panner recorded two milligrams of gold and one immediately knows that that corresponds to 12-cent ground; in the 17th foot there were 11 mg. or that ground was 66-cent ground.

This value is obtained thus: Each running foot means 0.01 cu. yd. Therefore if we get one milligram from 0.01 cu. yd., from a yard we should get 100 mg. and as a gram of gold (as ordinarily found in the gravels of the San Joaquin and Sacramento valleys) is worth about 60c., 100 mg. is worth six cents. This method of recording weights emphasizes the occurrence of pay-streaks much better than that of recording colors only.

Fig. 1.

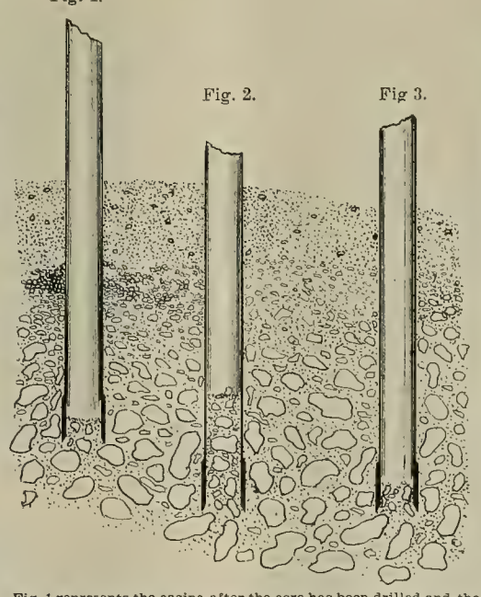

Fig. 2.

Fig 3.

Fig. 1 represents the casing after the core has been drilled and the drillings pumped out. The blocks are then put on and the casing driven one foot.

Fig. 2 represents the pipe with the core in it just after driving, and before drilling.

Fig. 3 is the same after the core has been drilled and dumped, and the casing made ready for the next drive.

In column 'G' is recorded the amount of material obtained by pumping, as measured in the pan. It is a rough check on the volume extracted and its use is shown later. In column 'H' is given the time of each pumping. It helps to afford an idea of the stiffness of the ground by a measure of the time it takes to drive, drill, and pump a foot. In column 'I' is recorded the character of the ground in regard to its tightness. Ground is classed as 'loose,' 'firm' and 'very firm.' 'Loose' ground is that which can be drilled and pumped at the rate of one foot every 5 to 9 minutes; 'firm' ground would be such as required from 10 to 14 min. for the same operations, and 'very firm' that which required a longer time. In column 'J' is recorded the formation as passed through. This is classified under the following heads: Clay, sand, cemented material, fine gravel, medium gravel, coarse gravel and large boulders.

Under the head of remarks almost anything important or unusual is recorded. This would include the amount of black sand, the occurrence of amalgam, etc. Here also would be mentioned anything peculiar about the gold such as its lightness, both in weight and color, and the occurrence of flour gold. The delays, with their causes and lengths, would also be stated here.

Table 2 is the summary which follows each hole. It is self-explanatory. The water-level is measured during, or after, the casing is pulled. If there is no danger of the ground caving, this is left till but one joint remains in the ground. If there is any danger of the ground caving, the measuring is done after each joint is pulled.

I think I have shown how the drill and its record can be made to answer all of the first four questions, with the exception of the value of the land and the

TABLE II.

Hole No. 29.	C_2	W. J. Smith's Tract.
Commenced hole	7 a. m.	10–25–1904
Finished drilling	8 a. m.	10–26–1904
" pulling	9:47 a. m.	10–26–1904
" hole	10:05 a. m.	10–26–1904
Depth of hole	39 ft.	
" to bedrock	35.5 ft.	
Character of bedrock	Soft white tuff, much slime	
Depth of soil	4 ft.	
Water level from surface	14 ft.

Loose gravel	5–10, 23–24, 31, 33	
Firm gravel	11–15, 19–22, 25–26, 32, 34	
Very firm gravel	16–18, 27–30, 35	

REMARKS.—A great deal of sand occurs mixed with gravels and in places there is enough water to cause the ground to run.

Calculated volume	0.38 cu. yd.
Volume by cores	0.45 cu. yd.

contour of the bedrock. These are obtained by the use of the records in the log-book with those obtained in making the surveys. By running a line of levels over the holes, and using the depth to bedrock a found in the log-book, the contours of the bedrock can be established.

Calculating Values.—In figuring the value of the ground one must be certain of the volume of material from which each sample came. It is the lack of this knowledge which has caused most of the errors made in valuing ground by the method of boring holes. The volume of a hole excavated as described is not that of the inside of the casing, but is the volume of a cylinder whose length is the distance from the surface to bedrock, or as deep as pay goes, and the area of whose base is the area of a circle 7.5 in. diam., that is, the diameter of the shoe. If no ground has run into the pipe, we can use what is called Radford's factor, that is, 0.27. This is used in the following way: Multiply the depth in feet by 0.27 to get the volume in cubic feet. To reduce to cubic yards divide by 27. To simplify matters, divide the depth of the hole by 100 to get the volume in cubic yards. This factor was obtained by experiment in one case, and apparently does not take into consideration the possibility of any other material, not belonging to that cylinder, running in. This ground that has run into the pipe carries gold and must be taken into consideration in figuring the volume from which the sample came.

The weight of the gold from the hole in Table 1 was 184 mg., or approximately 11.04c.; the volume for 38 ft., according to Radford's factor, was 0.38 cu. yd.; therefore, the value of a cubic yard is 29.05 cents.

In looking at the cores in column 'B,' it is seen that they differ for the different formations drilled. For

example, compare the cores in columns 'B,' 'C' and 'D' for the following feet with those of any of the others: 11, 12, 13, 19, 20, 21, 22, 30, 31 and 32. In 'B' they are larger than ordinary and in places in 'D' we see that the core after pumping is greater than before. There is only one conclusion; the ground is running into the pipe and here we are getting more than is represented by a cylinder 38 ft. long and 7.5 in. diam. This must increase the volume, and it certainly increases the gold obtained, as can be seen by looking at column 'F.' This increase in volume must be taken into account or else the increase in the amount of the gold will give a false return.

By a careful use of the core-lengths recorded and the volumes given in 'G,' the volume of the incoming ground is obtained thus: Opposite the 11th foot the core after pumping is 0.7 ft. and before it was only 0.5 ft.; clearly a running-in of 0.2 ft. Then, too, in column 'G' we get one pan of material where we have only been getting 0.75 pan before. That shows that a little more was pumped than was to be expected by the core after driving.

Again in the 12th foot we have a running-in of 0.5 ft. after pumping, and to begin with we had 2.9 ft. core where we did not look for more than 2.2 ft.; therefore, for this foot alone, we have a running-in of 1.2 ft. By going down all of the cores we see that there has been a running-in of about 5 ft. Then by looking at the pans we see a greater amount of material than was to be expected from the cores. For this hole this amounts to about another two feet; that makes an extra 7 ft., or the hole corresponds to a depth of 45 ft. and the volume would be 0.45 cu. yd. Using this as our basis of valuation of the ground, we get an average of 24.5c. per yard. This is about 15% lower than the yield we found above and I think is much nearer the true value. Such a difference would destroy the valuation of a large deposit.

Of course, all holes do not contain running ground and where they do not, there is not the need of making these modifications. For this class of ground this form of log-book seems to record the facts better than a simpler type. As one cannot tell when running ground is to be encountered, this form of notes should be used all the time.

Final Calculations. — The average value of the ground for the whole area is obtained in the following way: Multiply the average yield of the ground for each hole by its depth in feet; add these products and divide the sum by the sum of the depths. The volume is obtained as soon as the area is known and the average depth over that area. The gross value of the deposit is then found by multiplying the value in cents per yard by the total number of yards. The net value is obtained by subtracting from the gross value the cost of the land, the cost of working, and the loss in tailing. These will differ under different conditions and in different parts of the country.

Cost of Drilling.—Drilling costs vary from $1.40 to $3.50 per ft., with an average of $2.50 per ft. The costs per day are divided about as follows:

Machine-man		$ 3 50
Panner		3 00
Fireman		2 50
Roustabout and team	4 00 to	5 00
Superintendence	3 00 to	7 00
Wood	3 00 to	5 00
Repairs		3 00
Rent		5 00
Total	$27 00 to	$34 00

A machine will make from 12 to 40 ft. per day; it is impossible to give an average, as it varies in different parts of the State.

Changing Tools.

Value of Tests.—Drilling followed by dredging, as at Oroville, has shown that only about 75% of the yield shown by drilling has been recovered. To test the value of these tests one acre was drilled with 23 holes and the dredging returns produced bullion worth 95% of that shown by the drilling results. In another case, a boat dredged only about 35% of the gold as shown by the drilling, but in this case there were only two holes per acre. It is plainly seen that the more numerous the holes the more accurate is the sampling. With care and a careful superintendence of the drilling, there is no reason why these results should not be fairly accurate; they can always be checked by the sinking of shafts preparatory to the commencement of actual dredging.

Discovery of Cyanide.—Scheele, in 1783, laid the foundations for the manufacture of cyanide of potassium. With prussiate of potash for its base, dried animal matter of any and all kinds was dumped into the superheated vessels containing the potash, together with iron filings and borings. A stone-like, black mass resulted from the cooling; and other processes brought the final lemon-colored crystals which resulted from evaporations of the solutions. From these crystals prussic acid was evolved. A chemist, putting a cyanide solution in a gold-lined dish in 1844, discovered that the gold was dissolved in the liquid. This was the beginning of the gold-plating process by the use of cyanide; and the further involvement of the poison came about in treating refractory gold ores.—*Technical World.*

Driving the First Joint.

How the Ontario Mine Was Found.

Written for the Mining and Scientific Press by Walter P. Jenney.

In the summer of 1882 I was traveling through Sonora, with Mr. George Hearst, when he told me how, ten years before, he found the Ontario mine. A prospector from Parley's Park, Utah, had brought into Salt Lake City samples of quartz mixed with canary-yellow and bright blue oxidized ore (the characteristic surface-ore of the Park City district resulting from the oxidation of mixed galena and arsenical gray copper), that assayed 100 to 300 oz. silver per ton. The vein, the prospector stated, outcropped 50 ft. wide for hundreds of feet along the mountain-side. Mr. Hearst said: "When I got there, I found an immense reef of quartzite, with occasional scattered nests of ore, and saw at once that it was no good. That reef is there today in McHenry gulch, and has never been worked, save in a small way. While I was looking over the ground, a miner told me that about two miles west, just over the divide, some boys had struck a vein of the same kind of ore, and he thought they had a good show to make a mine. I went to see it; they had two openings on the vein less than 100 ft. apart, and a shaft down about 50 ft. The ore in the widest place measured not more than 18 in., but the vein had all the marks of a thoroughbred; and I decided to buy it, if the ore assayed as well as it promised. When I got back to Salt Lake, my samples assayed 60 to 125 oz. silver per ton, with an average of about 80 ounces. Shortly after this, I purchased the mine for myself and Mr. J. B. Haggin of San Francisco, for $32,500, and Mr. R. C. Chambers was appointed superintendent. The Marsac mill, built for the Flagstaff mine, was leased, and we at once started to open up the property."

In its early history the Ontario never had an assessment; the mine paid for everything, repaid its purchase price and met, from the output, the expense of machinery and development. The gross production to date is nearly $36,000,000 and there has been disbursed in dividends $15,000,000.

The Value of the Orient.—Without transportation there can be no commerce. As civilization has advanced, commerce developed, transportation cheapened, and the wants of man expanded, the importance of the commercial prize of the Orient has increased until its value has today reached the enormous sum of nearly 3,000 millions of dollars per annum. In 1805, the world had not a single steamer upon the ocean, a single mile of railway on land, a single span of telegraph upon the continents, or a foot of cable beneath the ocean. In 1905 it had over 18,000 steam vessels, 500,000 miles of railway, and more than 1,000,000 miles of land telegraph, while the very continents are bound together and given instantaneous communication by more than 200,000 miles of ocean cables, and the number of telephone messages sent aggregate 6,000 millions annually, and one-half of them in the United States alone. The effect of this enormous increase in the power of production, transportation, and communication has been to multiply commerce in all parts of the world. The world's international commerce, which a single century ago was less than two billions of dollars, is now 22 billions, and the commerce of the Orient, which was less than 200 million dollars, is now nearly 3,000 millions.—O. P. Austin, Bureau of Statistics.

Life at Johannesburg.

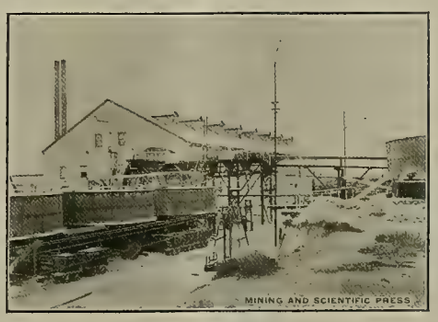
In the *Daily News*, one of the leading newspapers of London, H. W. Massingham describes the golden city of South Africa in a manner calculated to interest our readers. He says:

Johannesburg is an infant phenomenon in cities, a mere babe of eighteen years' growth. It, too, has its shabbily splendid air. Skyscrapers are joined onto common things in corrugated iron; commercial palaces descend into unpaved or ill-paved pathways. The fine shops in Pritchard street are as lavishly equipped with modern finery as those of Oxford Circus, and here and there exhibit lines of genuine beauty. But symmetry in height and plan is completely wanting; the streets, like the mine owners, are a law to themselves. Farther out live the dependents, Asiatic or European, Indian hawkers and traders, Portuguese market gardeners, Malay or Jewish cabmen, while more distant locations are being built for the Kaffirs. The talk and tone of the city are thoroughly cosmopolitan. Inscriptions in Yiddish or Chinese are to be seen in the windows of many of the smaller shops on the outskirts.

The city has many of the characteristics of the mining camp. The Rand is largely a community of bachelors, living well but cheerlessly in boarding houses. Men are as three to five of the residents, and if you take the population over 16, two to one are males. The Postmaster-General assured me that not 5% of his clerks were married men. The women are pretty, rather delicate, in air. They dress with refinement, and many have the spoiled, petted expression of carefully tended and much-admired beings. The night side of such a society exists, but is more decently veiled than that of London. There is a strenuous and public-spirited municipality, which proudly owns a debt of five and a half millions, plus its share of the extravagant price—three and a half millions—paid for the water supply. But the debt is partly remunerative, and a large scheme of re-housing promises well. The spirit of the Council seemed to me enlightened and progressive, and the water board stood up manfully and hotly to Lord Milner when he intervened to secure Messrs. Eckstein the inflated price they claimed for their water properties.

Living is abominably dear. Food prices are tolerable, with the exception of some luxuries, like champagne, which costs from 25s. to 30s. a bottle. But rent in itself is almost prohibitive of living on the European scale of salaries and wages, and greatly hinders marriage. Within the town £8 a month have to be given for lodging barely sufficient to house an artisan family of five, and Mr. Aiken assigns the living cost of such a family at nearly £300 a year. For the professional man rent is also out of all proportion even to our London experience. A house which would rank as a comfortable but smallish villa for Clapham or Putney will cost £100 a month on the outskirts of Johannesburg. In Parktown, the 'fashionable' suburb, not a dwelling can be rented for less than £50 or £60 per month. High wages, a high rate of interest—8%—on mortgages, and the cost of building material are large items in these charges, swollen by the vicious system of using railway rates as a main source of revenue. Wages and salaries partially rise to meet this expenditure. The skilled miner may make £40, £50, even £90 or £100 per month on his monthly contract. Skilled workmen earn from £1 to 25s. or 30s. per day. In a printing office a linotype operator gets £7 a week, and the working week is not long, ranging from 45 to 48 hours. Among the professional ranks, a sub-editor makes from £400 to £500 per year, and the highest editorial salary I know of is £3,000.

One of the first discoveries that a stranger makes in Johannesburg is that no one—not even the cabman or the policeman—knows his way about it. The dwellers in this city-center of 60 miles of gold-bearing reef rarely look on it as their home. 'Cousin Jack,' the Cornish mining contractor, and the millionaire owner of the soil and what lies below it, alike turn their eyes to Europe. Most of the heads of the great houses are absent, though the peril of a political reverse is driving them back. Thrift does not prevail in unsettled societies. Money in Johannesburg goes as lightly as it comes, and wages and profits are easily diverted to the Kaffir market, for all classes join the gamble in its shares and speak its jargon. The tone is secular; the earth-spirit demands a man's all, and usually gets it. Most of the constituents of the strangely mixed community—black, white and yellow—are pleasure loving, and Sunday is a day of amusement, with cricket and tennis in full swing, and gaily dressed parties everywhere. Straw and felt hats and light jackets are the only wear for men Sundays and weekdays; our tall hat and frock coat are taboo in South Africa, and I believe the High Commissioner is willing to banish them from his garden parties. Club life is indispensable to such a community, and all parties meet in it on outwardly friendly terms. The spacious hall of the Rand Club, on the first floor, set in a pleasant decoration of green and gold, forms the social and political exchange of the day. There magnates, mining magnates, engineers, prospectors, Government officials, lawyers, Boer generals, "Progressives," "Responsibles," journalists and nondescripts meet in crowds for coffee and talk after the luncheon hour. A quieter retreat is the Athenæum, where the mining element is somewhat less dominant. But practically all Johannesburg society is made by the heads of the great financial groups and their more trusted dependents—many of them American—whose salaries of £5,000 a year or so enable them to run the race by the side of their chiefs. There lies the danger for the Government; their servants are far too near the mining 'super-man' to maintain full independence of policy and demeanor. Gossip naturally has a cynical edge; none is spared by it. Men's pasts are too recent—and too interesting.



City & Suburban Mill.

The Rand

The mining over-lords of Johannesburg have done little to dignify it with public buildings or memorials of their wealth and power. The municipal offices are a mean labyrinth of wooden shanties, and public spirit is timid and depressed in a community where, after a brief revival, a free daily press has ceased to exist. To the pessimism that weighs down an Englishman's active, practical spirit when he surveys the seeming caprice of Nature as she deals with man and his works in the South African desert, are added the want of free institutions and the fear of the great houses, with their hand on the springs of every man's material life. They use their influence hardly. Rebels like Mr. Wybergh, Mr. Cresswell and Mr. Pim, in their way the salt of English society on the Rand, become exiles as soon as they lift a finger against the decreed policy. "I lost 40% of my trade when I opposed the coming of Chinese," said a leading figure in Johannesburg.

A certain newness and rawness run through the life of Johannesburg; it is a hastily scrawled chapter of South African history. The streets are more tumultuous than our own, and gay even in these depressed times. The subjection of the Kaffirs is marked. In Cape Town the mixed colored population disputes the pavement with the white man, and shows him no outward deference; in Bloemfontein it is submissive, but is not excluded from the sidewalks; in Johannesburg the native keeps humbly to the roadway, and is never seen abroad in the evening hours. The mixture of races, the gaudy coloring in the shawls and headdresses of the native women, the louping run of the bedizened Kaffir 'rickshaw bearers, the rattling of the mule teams and trolleys used in the service of the mines, and the exuberance of their black drivers, all the hurry and disordered fret of a community working at high pressure for the bread that perishes, make up a picturesque jumble such as our more settled and homogeneous city life does not know. Poverty, indeed, as we have it—poverty in rags and grime—is unfamiliar. There are distressful cases, and things are incomparably worse than before the war, but there is something like an equilibrium between demand and supply in white skilled labor. The capitalist has no 'overspill' to play with, and wages are almost constant at their present high figures. All white men dress well; slovenliness in appearance is usually due to drink or luckless gambling in shares. I have heard of £2,000 or even £3,000 accumulated by miners and lost in this fashion. The range of achievement in art is naturally poor; no form of dramatic amusement seems to be seriously cultivated, and the music-hall in particular, though respectable enough, hardly touches a fair provincial level.

TIMISKAMING COBALT MINES.—The ores are in veins, usually nearly vertical, in the Lower Huronian sediments, in the Keweenawan gabbro, and to a less extent in the Keewatin green schists. These veins vary in width from a fraction of an inch to a foot or more. While for the most part their walls are well defined and their direction constant, they frequently divide and bend. They follow with local variations systems of joints which cut the region somewhat uniformly in north to northwest and east to northeast direction. An inspection of the map of Ontario shows many of the drainage lines following approximately these directions, though it is not known that they are all controlled by joints or faults. The depth of the veins has, for the most part, not been determined, but it is known that they are most even and persistent in the Huronian sediments and the Keweenawan gabbro, and that in reaching the Keewatin below they become less uniform and persistent, a fact to which may be attributed the less common occurrence of rich veins in the Keewatin than in the overlying formations. The depth is thus practically measured by the thickness of the Lower Huronian, given as 500 ft. as a maximum, but usually less.—Willet G. Miller, *Ontario Bureau of Mines.*

APPLIED GEOLOGY.—Nothing appeals so strongly to the practical man as a specific case to illustrate a given proposition. The value of concrete instances in illustrating the application of geology to engineering problems can hardly be over-estimated. The student may forget an abstract geological principle before he has left the lecture-room; but he will remember an actual case, illustrating the application of that principle, for years. It seems to me that a most important part of the work in teaching applied geology is the securing of details regarding actual cases in which geology has been used to such advantage by practical men. Many such cases can be found by looking over the literature, but another source of wealth is to be found in the cases which come to the knowledge of geologists and engineers, but which have never found their way into print. One cannot help wishing that these edifying experiences might be made available for the benefit of the younger and less experienced men, by publication of the valuable technical details, stripped of the personal features which might otherwise make the publicity distasteful to some of those concerned. Many are the valuable object lessons that would thus be presented to the younger engineers and geologists.—Douglas Wilson Johnson, in *Economic Geology.*

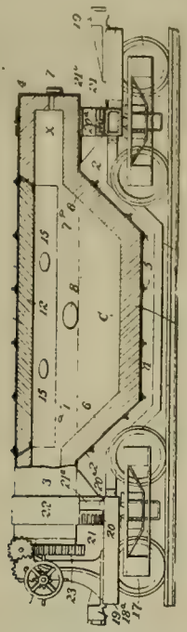
THERE are 58 tube-mills at work in, or ordered for, the Transvaal.

Mining and Metallurgical Patents.

PATENTS ISSUED JANUARY 23, 1906.

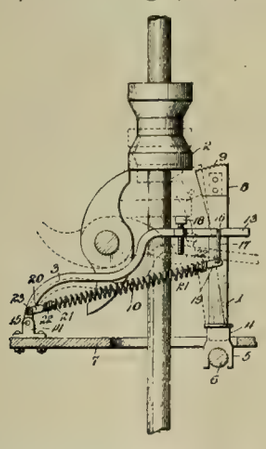
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

APPARATUS FOR STORING AND CONVEYING LIQUID METALS.—No. 810,301; C. Von Philp, Bethlehem, Pennsylvania.



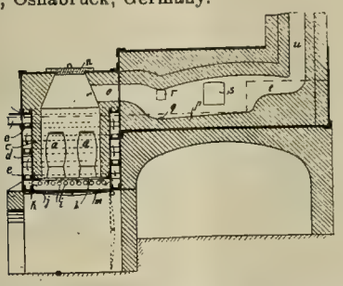
An apparatus for storing and transporting molten metal consisting of a vessel and suitable trucks supporting the same, the vessel having an enlarged body portion and hollow contracted cylindrical ends containing burning-chambers and means for admitting fuel thereto; ends turning in bearings on the trucks.

AUTOMATIC SAFETY ATTACHMENT FOR STAMP MILLS.—No. 810,006; J. C. H. Vaught, Lead, South Dakota



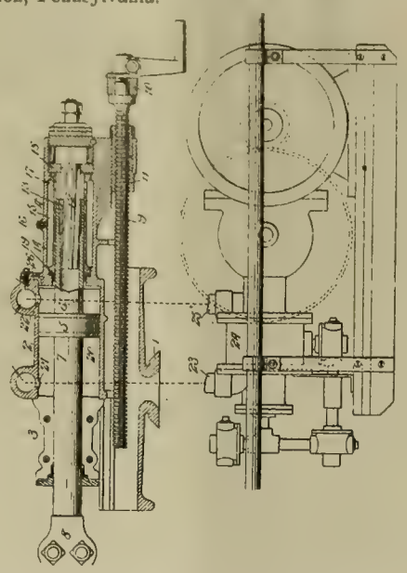
The combination with a tappet, and a cam for actuating, of a safety attachment for stamp-mills, comprising a tappet-support normally arranged beyond the path of the tappet, and means located beneath the cam-actuated tappet and arranged to be directly operated by the tappet for moving the support into the path of the tappet, whereby the latter will be supported out of operation.

DUPLEX SMELTING FURNACE.—No. 810,063; R. Lindemann, Osnabruck, Germany.



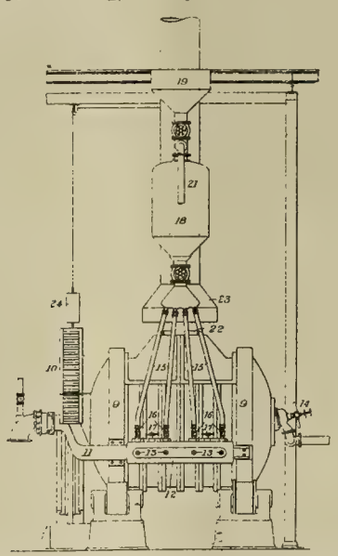
In a duplex smelting furnace, a primary hearth capable of being intensely heated, an inner refractory wall around hearth, an outer metal casing surrounding inner wall, air passages in outer casing, an air inlet communicating with air passages and with a source of air under pressure, a baffle-plate for directing the admission of air in opposite directions from the air passages round the furnace to the hearth, air holes at the base of the primary hearth for admitting the air under pressure, a movable plate adapted to shut off hermetically the ash pit from the primary hearth, and a secondary hearth alongside the primary hearth and capable of being heated by the waste heat from the primary hearth.

ROCK DRILL.—No. 810,639; Arthur H. Gibson, Easton, Pennsylvania.



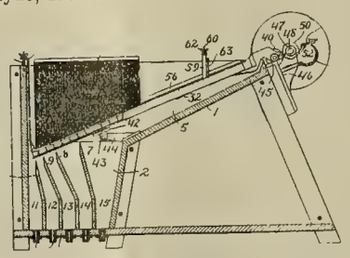
The combination with a rock-drill cylinder having a rear extension, of a piston having a hollow tail-rod extended into and entirely inclosed by said rear extension, a sleeve surrounding the tail-rod forming an annular chamber within the rear extension, a rifle-bar telescoping within the tail-rod, a port leading from the annular chamber to the air space within the sleeve and tail-rod and an aperture leading from the annular chamber to the exterior.

METHOD OF REFINING COPPER.—No. 810,249; R. Baggaley, Pittsburg, Pennsylvania.



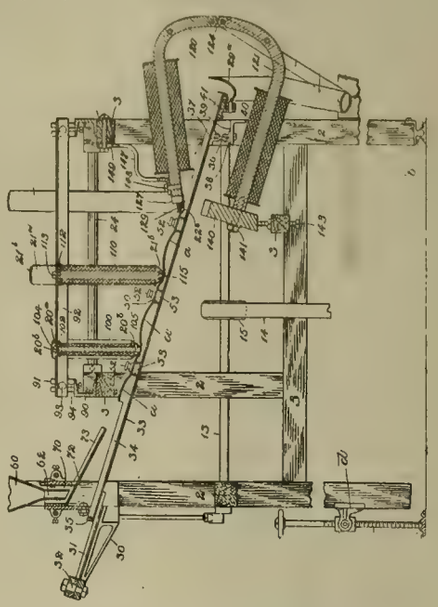
The method of refining copper, which consists in injecting sawdust into a bath of molten copper in a bessemer converter before oxidation is completed and utilizing air under pressure as the propelling medium.

ORE CONCENTRATOR.—No. 810,847; Emil Deister, Fort Wayne, Indiana.



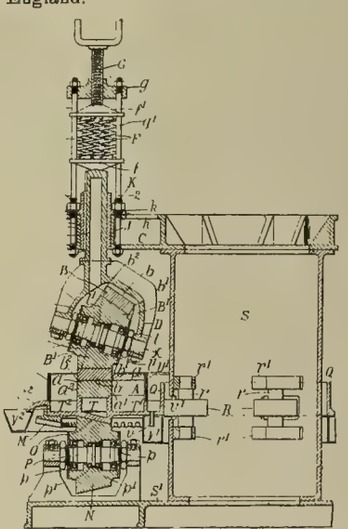
An ore concentrator comprising a stationary tank adapted to hold a body of water; and a concentrating pan having upturned sides at its upper portion and convergent edges at its discharge end, and having also riffles upon its concentrating surface which converge toward its discharge end, the said pan being arranged in the tank with its concentrating surface beneath the level of water contained therein, and being adapted to be reciprocated in line with the plane of its concentrating surface.

MAGNETIC SEPARATOR.—No. 810,841; Henry F. Campbell, Melrose, Massachusetts.



The combination in a magnetic separator, of a magnet; a tray, presenting an unobstructed surface at a due distance below the magnet, for supporting and conveying the material spread in a film of substantially uniform thickness under and past the magnet, and through an uninterrupted field of such magnet, a cover for said tray for preventing the passage of magnetic particles to the sides of the magnet, and means for imparting a transverse shaking movement to the said support.

PAN-AND-ROLLER MILL FOR CRUSHING AND GRINDING.—No. 810,830; Johannes C. Wegerif, Battlesbridge, England.



In a pan-and-roller mill, the combination with a pan provided with a horizontal grinding-face upstanding from the bottom of the pan and having its inner and outer faces vertical, of a grinding-roll of truncated conical form disposed with its smaller end toward the interior of the pan, the axis of the roll being set skewwise in the pan and at such an inclination as to enable parallelism to be maintained between the grinding-faces of the pan and roll at their line of bite, the relative widths of said faces being adapted to prevent the formation of a groove or step on either of them, and the marginal portions of the inner and outer ends of the roll being respectively concave and convex so as to be normal to the grinding-face; a dead-axle whereon the roll is mounted to rotate; a yoke-frame straddling the roll and carrying the ends of said axle; a vertical ram integral with said yoke-frame and having its axis alined to intersect the line of bite of the pan and roll at the center of said line; and a bearing in the frame of the mill adapted to permit of said ram moving vertically without turning.

MINING SUMMARY.

Specially Compiled and Reported for the MINING AND SCIENTIFIC PRESS.

Special Correspondence.

LONDON, January 24.

The output of gold from West Africa in 1905, £632,757, compared with £345,608 in 1904 and £254,790 in 1903, shows an appreciable progress. The result is, however, far from satisfactory, as against the amount of capital which was embarked in Gold Coast mining, mainly during the lull in gold mining in the southern part of the African continent consequent upon the Boer war.

One of the striking disappointments of West Africa is the Gold Fields of Eastern Akim Company, which held a meeting of its shareholders last week to consider a scheme of reconstruction. The origin of this company may be traced to the Castle Gold Exploration Syndicate, which, starting with a nominal capital of £50,000, purchased for £700 in cash and £3,000 in shares properties covering 500 square miles of territory. From this operation was evolved an example, as the *Economist* describes it, of the marvellous methods of mining enterprise in West Africa. Before the Castle Gold Exploration Syndicate was wound up in 1903, the goldfields of Eastern Akim arose under its auspices. Of the available cash capital of this offspring, amounting to £98,805, the developments on the property, including a road 52 miles long through a part of the Colony previously almost unknown, absorbed £97,870. Thus the company, like many others ranging over an unwieldy area, exhausted its financial resources before obtaining any sure indication of the potentialities of the property it was intended to explore. In all, nine companies were formed as the outcome of the Castle Gold Exploration Syndicate, their capitals aggregating a total of £1,060,000, composed largely, it must be said, of paper. Most of these subsidiary companies, it is stated, were prevented by a variety of causes from doing more than prove that their concessions were valuable. The measure of success achieved by this group of bantlings may be gauged by their market prices of today—for the best of them bring only a shilling or two per share.

A more cheerful theme for comment is to be found in the proceedings at the annual general meeting of the Associated Northern Blocks (Western Australia) held last week. The workings during the financial year ending September 30, 1905, were limited to the development of the old Brownhill lode across the property, going into the Oroya. At the western end a new orebody was opened out, extending up to the Kalgurli. Satisfaction was expressed in the reduction of costs during the year. The cost of development per foot was £2 15s. 7d., against £3 14s. the previous year; diamond drilling was 10s. 7d. per foot, instead of £1 in 1904. The working expenses amounted to 26s. 2d., namely, ore extraction, 8s. 1¾d.; milling, 13s. 4½d.; general, 4s. 7¾d. Forty thousand one hundred and forty-six short tons of ore were treated, with a recovery of 89.6%, and 3,095 tons of slime were re-treated, yielding a total of 46,605 oz. bullion, which realized £183,095 7s. 7d. Debiting the whole of the mine development and the working expenses, and writing off liberal allowances for depreciations on capital expenditure, and charging all administrative outlay, a net profit was shown of £71,889 0s. 2d. After paying dividends amounting to 25% for the year, the funds in hand were £132,000. The company has observed the sound policy of largely writing off the capital expenditure to revenue account, prompted to this course probably by the anticipation some little time back of soon exhausting the mine. Although the grade of the ore has seriously fallen off, the reserves have, contrary to expectation, again assumed very satisfactory proportions. At the end of the year they amounted to 89,399½ tons (of 2,000 lb.) and were valued at 100,000 oz., or an average of 22.37 dwt. per ton. Thus the company's assets, represented by its funds in hand and net ore reserves, were, at the end of the financial year, at a ratio of about parity with its nominal capital of £350,000. In addition, the company held a three-fourths interest in the Great Leviathan Lease, at Yilgarn, described as still in the prospecting stage, but of a promising nature.

A canny Scot, writing to a financial paper lately in a disillusioned vein concerning his speculations in certain South African mines, was moved to warn his brother shareholders against a too great reliance on mining valuations. Even where big developments and ore reserves are the order of the day, prophetic utterances on prospective values must not, like the Delphic oracle, be deemed infallible. Much more is this to be borne in mind in dealing with mineral properties in the early stage of exploration. Two cases of this kind came under notice at company meetings last week, the mines being whole continents apart. The chairman of Dolores Limited (Mexico), in dilating on the unexplored resources of the mine, pointed out that the original owners did not suspect the existence of the Alma vein, upon which some £300,000 worth or more of ore is now opened up, when they started the main tunnel crosscut. They intended the crosscut for the exploration of a vein which they had worked from the surface, but on reaching a point 150 ft. short of the vertical line of that vein, the crosscut intersected another vein—the Alma—which was found to be so rich and powerful that they left the original vein, for which the mine was originally purchased, entirely alone. The other instance was mentioned at the meeting of Sansu Mine Ltd. (West Africa). The consulting engineer, Arthur C. Hodge, stated that with regard to the developments, he had recommended work at the southern portion of the mine, near the granite contact; they had not, however, touched that granite contact at all, because in sinking the shafts and crosscutting 44 ft. they cut the lode where it was surprisingly rich; they had not expected to get anything of value in that, the northern, part of the mine.

Another new development is reported in the Eastern Rand area (South Africa). At the Cinderella Deep, in the neighborhood of Boksburg, the drill in a borehole from bottom of the shaft—3,900 ft.—entered the Main Reef series at 4,000 ft.; the reef is stated to be 9½ ft. wide. The opinion is held that the greater depth of reef shows that both the outcrop and deep-level mines in the vicinity contain much more reef, giving a longer life than was anticipated.

A recent cable stated that assays made of the 6-ft. upper band in the borehole show an average value of 20½ dwt. over one continuous width of 6 ft. The richest portion lies in the foot-wall section of this upper band, of which nearly 15 in. gives a mean assay-value of 92¾ dwt. The appearance of the reef is reported to be similar to that in the Cason mine, to the north.

ALASKA.

The Kirkman Creek concession has been canceled and was thrown open on Jan. 31. The concession extends from the upper line of the Discovery claim down the stream for five miles. It was granted to Peter R. Ritchie and G. F. Washburn in 1901.

It was in the fall of 1904 that the productive claims on Little creek, in the Nome district, first came into prominence. Since then they have yielded nearly $1,500,000. Much the greater part of the gold taken out came from four claims located within an area little greater than one-tenth of a square mile. Little creek is a tributary of Snake river, at the mouth of which is Nome. The bonanza claims of 1904–5 are near the tracks of the Nome Arctic Railroad, three miles north of Nome. The gold deposits lie deep. Shafts have been sunk as far as 50 ft., but the average workings are between 30 and 35 ft. below the surface. Frozen muck and moss, varying in thickness from 12 to 23 ft., form a heavy covering for the gold-bearing gravels. Some of the gravels are apparently well-washed beach sands; others were without doubt deposited by streams. Beds containing boulders, some of which weigh a ton, frequently top the workable gravels and are a constant source of danger in mining, especially during summer months, when the roof is weakened by thawing. These boulders occur sometimes on bedrock and are sometimes found in the muck that overlies the gravels. Nearly all the deposits, from surface to bedrock, carry gold, but the rich gravels are found well down. In some places they rest directly on the schist; in other places they rise to the height of five or six feet above it. The gold-bearing gravels of present economic importance have a thickness of between four and five feet, which increased to 16 ft. in one instance where the material removed formed a lenticular mass. Thin, elongated lenses or beds of reddish sand, called ruby sand, the color of which is due at times to small grains of red garnet and at times to iron oxide, occur throughout the pay gravel and often contain so much gold that it can easily be detected, even in careless handling. Mica-schist, in which there are occasional thin limestone beds, forms the true bedrock, but the so-called 'bedrock' on which the gold lies is sometimes the schist, sometimes a clay streak, and in one place it is gravel cemented with calcite deposited by circulating waters. Part of the gold is fine, bright, and flaky, but part of it is coarser and contains many nuggets worth five and ten cents apiece and occasional ones worth several dollars. One important result of the Little Creek discoveries is that they have led to more active prospecting in the tundra gravels. It has been known for some time that a small amount of gold is almost always present there but the occurrence and position of any other beach line back of Nome can be determined only by actual investigation. It is safe to predict that the Nome tundra will be the scene of more extensive operations during the present winter than in any previous year.

In the Tanana district, at the upper end of Fairbanks creek, L. T. Holte is working No. 8 above, recently purchased from Shay & Hannon for $102,000. He is operating a 50-h. p. steam hoist. The upper half of No. 7 above is owned by Larsen & Meehan, who are hoisting pay dirt on to the dump. The lower half of No. 7 is owned by L. T. Holte, who is operating through his manager, Theo. Oleson. No. 6 above is not being extensively worked. The same may be said of No. 5 above. Dilman & Winters are working the upper end of No. 4 above. Several shafts have been sunk and considerable tunnel work done. The owners have been timbering their tunnels and will be ready for work in the spring. The middle portion of No. 4 is being worked by Belt & Hendricks. The lower end of No. 4 is being worked by Homer & Oscar. James Kelly is operating the upper half of No. 3 above and has a large amount of good pay dirt on the dump. The lower half of No. 3 is owned by D. B. Olson, who probably has more work done at the present time than any claim on the creek. Adolph Rippa has a lay on the upper half of No. 2 above and expects to do a large amount of summer work next year. The lower half of No. 2 is also being worked by laymen, and will also be made ready for summer work. No. 1 above is owned by Dan McCarty, but is being worked by Gus Bostron, who has the lay on this property.——Discovery claim is being worked by Shepherd Bros. They began operations last fall, and it has taken until this time to get the property ready for work. No. 1 below is being worked by Freeman & McLeod, on the upper half and by Julian & Spencer on the lower half. Rudolph Alm is interested in the upper part of No. 2 below. The lower half is being worked by Mr. McMahon. No work is being done at present on No. 3 below. Windlass work is being done on No. 4 below, but at present nothing definite is known as to what pay this claim will produce. No. 6 below is owned by James McNamee, and six sets of laymen are working on this claim. Nothing definite is known of No. 7 below. Billy James is preparing to do extensive work on No. 8 below. He has let several lays on this ground, and, as said, will work a portion of the ground himself. No. 9, 10 and 11 are owned by Mr. Solon and partners. No work has been done before on any of this ground, but the owners are preparing to prospect it. The Fairbanks *Times* says that Fairbanks creek has a bright future, and when compared to others in the district makes a good showing.

ARIZONA.

Cochise County.

R. V. Daniels, of the American Mining & Developing Co., states that his company has completed a 3,500-ft. tramway at its mine in the San Jose mountains, near Naco, and that he plans to start the company's mill on February 15.——The Tombstone Consolidated Mining Co., of Tombstone, has ordered an additional pump which will be placed on a 700-ft. level and used to furnish water to the pump on the 600-ft. level. The company's stamp-mill will begin operations about February 15.——Superintendent Fisher, of the Cochise Gold & Silver Co., let a contract for driving tunnel at the company's mine near Tombstone 100 ft. farther. The tunnel is now in 570 feet.

Gila County.

The Montezuma Copper Mining Co. have started development work on their property near Globe and at the depth of 18 ft. have struck sulphide ore. The company intends to continue sinking a perpendicular shaft until water level is reached before crosscutting the ledge. The shaft is 5x7, but will be timbered with 6x6 and 2x12 lagging, which will give them a compartment and a half 4x4 and 2x4 in the clear.

Graham County.

Among the companies mining for gold near Clifton are the Sierra de Oro, managed by Dell M. Potter; the Crawford Gold Mining Co., under the management of Ben M. Crawford; the Arizona Gold Mining Co., Wood Poland manager; and the Gold Belt Development & Reduction Co., under the management of E. U. Beauchamp.——The Shannon Copper Co. during 1905 received more than 500 oz. of gold and 17,000 oz. of silver from their copper ores.

Mohave County.

E. Riverol, of Los Angeles, has selected a site for a smelter at the Pinkham mine, near Chloride. He has a plant in operation at Los Angeles for experimental purposes, and is arranging to remove it to the mine.

Pinal County.

The main shaft of the Superior mine, near Florence, is down 750 ft. and is to be continued to the 1,000-ft. level. Water is coming in freely, but so far is kept down by pumping.——The mill at the Desert Queen mine, near Casa Grande, is to be doubled in capacity and a slime plant is to be put in.

Yavapai County.

The Red Man Mining & Milling Co. is working claims near McCabe. The main shaft is down 200 ft. A hoist and air compressor are to be put in.——The Metallic King Mining Co. is working claims in Lower Lynx creek, three miles from Dewey. A hoist has been placed on one shaft, which will be sunk 200 ft. The ore is free-milling above water level.——The Mark Twain and 86 mines, near Prescott, have been taken over by the St. Anthony Mining & Milling Co. A boiler, hoist and pump are to be placed on the property.

President J. M. Sullivan, of the Great Republic Mining & Milling Co., states that the shaft on the company's mine near Prescott will be continued from the present 725-ft. level to the 1,000-ft. level, and that another shaft, now down 200 ft., will be continued.

CALIFORNIA.

Humboldt County.

H. G. Van Vactor, president and general manager of the Klamath River Dredging, Mining & Developing Co., has purchased a drilling plant, which will be put on the Klamath river holdings of the company. The company has removed its headquarters from Dunsmuir to Eureka.——Bert Lucas, president of the Humboldt War Eagle Mining & Milling Co., is in San Francisco, arranging for the purchase of a stamp-mill to be put on the company's property, between Redwood and Willow Creek, near Eureka.

Inyo County.

The Great Western Ore Co., of Keeler, has notified mining companies that the company's smelter will be ready to receive ore on March 1.

Mono County.

J. M. Bryan, one of the owners of the Pittsburg mine, at Masonic, says that the camp is mostly in the hands of leasers, many of whom are taking out shipping ore. There are two blocks leased on the Pittsburg, one to Whiffley & Eastwood, who have shipped over $5,000 worth of ore to the Reno Reduction Works, and the other to Smith & Shaffield, who are also taking out considerable ore, which they are holding, as they will put up a mill on the ground in the spring. These leases do not expire until November.

Nevada County.

Worthington & Patrick have been awarded a contract to run the tunnel at the Zeibright mine, near Emigrant Gap, 50 ft. farther.——George Downey and J. Manion have been awarded a contract to sink the shaft at the Banner mine, near Grass Valley, 200 ft. deeper. The owners of the mine furnish power, air and supplies.——The hoisting works of the Nevada City mine was slightly damaged by fire last week.

Operations have been resumed at the Federal Loan mine in Willow valley, near Nevada City. Superintendent F. L. Whipple is in charge.

Placer County.

Work is to be resumed at the Hathaway–Eureka mines, near Ophir, after new machinery has been put in.——C. A. Reed is repairing the St. Patrick mill, near Ophir.——The Southern Cross on Duncan hill, near Ophir, is being worked by A. L. Martin.——Development work at the Kittler mine, near Ophir, is to be increased.——The Cornucopia mine, near Ophir, has been re-timbered by G. Savalle.

San Bernardino County.

Frank Cram and J. H. Pattee have purchased a 25-ton mill to be installed on the Brooklyn Mining Co.'s property at Highland.

Shasta County.

The Mountain Copper Co. has let a contract to J. W. Shelby to drive a 1,000-ft. tunnel at the Lone Star mine, west of Iron Mountain.

Sierra County.

(Special Correspondence). — The Tightner at Alleghany is going to put in a power plant and has already put in a compressor to run the drills. —— The South Fork at Forest City is working 20 men taking out good pay gravel. —— The crew of the Alleghany company's mine at Balsam Flat is being increased. —— The Sierra Buttes had to hang up the lower mill for a few days on account of repairs to the tramway, but are running to full capacity again with a crew of 120 men. —— The Cleveland mill at Alleghany has been started. —— The Empire mill, near Downieville, had to hang up the stamps on account of the electric plant burning out.—— Development work has been continued throughout the winter at the Sovereign. —— George W. Coover and George B. Morse have located a copper claim on the South Fork, between Sierra City and Downieville.—— Good ore has been struck in the upraise of the Last Resort mine.

Downieville, Feb. 5.

Work is to be resumed at the Deep Blue gravel mine at Alleghany by J. M. Walling. The main tunnel is to be repaired and driven ahead to prospect the channel.

Siskiyou County.

J. Freshour of Gottville will build a new ferryboat to replace the one which was lost in the recent flood. Gottville is 18 miles from Yreka on the other side of the Klamath river, and the ferry was the only means of crossing the river. The loss of the ferry forced the Lucky Bob mine, operated by C. W. Zimmer, E. S. Dingman and S. M. McFerran, and the Empire mine, owned by Carter & Taylor, to close down.——E. W. Raymond, superintendent of the Ball mines, near Sawyers Bar, is getting the property in shape for mining in the spring. Crosscut tunnels are being run now to connect the Stephens and Ball groups. ——The Medina Mining Co., of Oro Fino, that was compelled to close down the Old Johnson mine, on account of the ditch water freezing, has resumed work again. Their mill is crushing ore from the Gardner mine.

Trinity County.

The Bullychoop Gold Mining Co., operating on Bullychoop mountain, near Weaverville, will replace its present 10-stamp mill with a 50-stamp mill, to be operated by electric power. A third tunnel is being run at the mine, which will extend 1,500 ft. and tap the vein 600 ft. below the surface.

The electric dynamo at the Enterprise Mining Co.'s property on East Fork, near Weaverville, was started up a few days ago and the entire property is now being operated by electricity.——Schlomer Bros. began the operation of their placer mine at North Fork last week. Corbig & Lasche, of Los Angeles, have completed a plant for saving fine gold at the end of Schlomer Brothers' flume.

Tuolumne County.

A Los Angeles company has secured the Swerer, at Tuttletown, and work has been commenced under the superintendency of J. L. Witney.——Ten machine drills are at work on the 200, 300 and 350-ft. levels of the Draper. The mill's full complement of stamps is dropping. The water in the main shaft has been lowered to the 400-ft. mark. —— Work is to be resumed at the Republican mine, at Jacksonville, as soon as the flume is repaired.

COLORADO.

(Special Correspondence).—On account of complaints being made by investors against some of the promoters of mining stock in Denver, it is understood the United States Government is making a thorough investigation of several of the promoters and brokers and their methods of doing business. An exorbitant commission for financing a mining property is the complaint made by some of the investors and which has probably been the means of inducing the Government to take a hand in the affairs of the brokers. Many of the brokers are doing a strictly legitimate business, while others are not giving their clients any more then the law requires. In some cases it is claimed the postage bill and office penses are higher than the expenses of operating the property. A closing up of the unreliable promoters will be welcome by the ones who are doing a legitimate business.——The coal companies in the State are looking forward to the big strike on the Eastern mines as they believe there will be no strike among the coal miners of this State and that the demand for Colorado coal will be much greater than ever before. In anticipation of the above results, it is understood a large number of mines that have been idle for a number of years are preparing to produce coal.——The railroad connecting with the Colorado & Southern at Silver Plume, in Clear Creek county, and extending to the Wilcox tunnel and other properties in the East Argentine district has been completed.

Denver, Jan. 5.

Boulder County.

The Gold Run Mining & Tunnel Co. has consolidated the Tambourine group with the Tenderfoot, Daisy, Independence, Cedar Falls, Handy and other lode claims between Salina and Wall Street. They will extend the present Tambourine tunnel to connect with one driven from the north side of the mountain.

Chaffee County.

The Colorado Comstock Mining Co. plans to drive a 2,000-ft. tunnel into Pomeroy mountain, in the Chalk Creek district, near Hancock. Machine drills are to be used.

Clear Creek County.

(Special Correspondence).—Deep development by crosscut tunneling is being prosecuted in Clear Creek county. In the early '70s the mines were producing fortunes for their owners, even under the wasteful methods of those days; mines which since have, from various causes, been worked at a meagre profit, at a loss or not at all. In many instances veins lost their contin ity, values disappeared at shallow depth, and the conviction prevailed that 'ore values did not go down.' Clear Creek county is now making a good showing with her deep crosscuts. That of the Two Brothers tunnel, of the Specie Payment Gold Mining Co., was started two years ago from Virginia canyon, 2,600 ft. distant from the Specie Payment vein, and reached it January 7, 1906, cutting it at 1,400 ft. in depth.

Georgetown, Feb. 3.

The Crown Point claims, on Columbia mountain, near Empire, have been transferred to the Bellevue-Hudson Mining Co., who will continue the crosscut drainage tunnel.

A rich strike has been made on the Peters lode, near Georgetown, owned and operated by the Pay Rock Mining Co. In driving east from the Ashby tunnel level a body of solid smelting material has been uncovered. The Pay Rock group is being developed under the management of E. F. Kendall.

Gilpin County.

The shaft of the After Supper mine at Black Hawk is to be sunk 300 ft. deeper to a depth of 750 ft. A. Waters has charge. —— The consolidated properties known as the Gregory-Bobtail, Fisk, Cook, Mammoth and others in the Gregory district, which have been operated under the Gregory & Bobtail Mining Co., are to be operated as the Fifty Gold Mines Corporation, with O. B. Thompson as manager.——The Boston & Colorado Smelting Co. at Argo will pay an advance of 25c. per unit for the copper contents in ores over previous schedules.

Superintendent S. T. Harris, of the Taawasa Gold Mining & Cyaniding Co., operating the Aduddell mine in South Willis gulch, near Central City, is to let a contract for sinking 100 ft. and driving six levels 100 ft. each. The last lift of 100 ft. was sunk with four men in 35 days. The main shaft is down 500 ft., and as soon as levels are started at the bottom sinking will again be resumed, with the intention of continuing the shaft for a depth of 1,000 feet.

Lake County.

The Damascus Mining & Milling Co. is building a custom mill in Leadville, to be equipped with seven magnetic separators. It will also treat ore from the company's property on Mosquito range. It is expected to be completed by March 1.

Pueblo County.

The Philadelphia smelter, owned by the smelter trust in Pueblo, has resumed operations. New machinery, which has been ordered, will arrive immediately and be quickly installed.

San Miguel County.

H. H. Hutton, of Ophir, has taken a lease on the Silver Bell from the Ophir Consolidated Mines Co. He is taking out shipping ore only and holding the milling ore in the mine for treatment as soon as it is possible to start the mill in the spring.

Summit County.

The Abundance Mining & Milling Co., operating extensively on Mineral hill, near Breckenridge, with W. C. Off as managing director and J. G. Goodier, general manager, hope to contract with reliable parties to drill 1,000 or 1,500 ft. on their property on the western slope of Gibson hill, known as Yuba Dam Flats. Otherwise they will purchase the necessary plant and operate it themselves.——The Abundance tunnel, being driven into Mineral hill, has been run 285 ft. of the 1,200 ft. projected.——The Jessie Mines Co., with Jas. T. Hogan as president and general manager, has been organized to operate the Jessie mine and mill near Breckenridge.

Teller County.

The Gold Sovereign mine, on Bull hill, Cripple Creek, has been divided into leasing blocks from the surface to the seventh level. The company will continue to work from the eighth level.

The estimate of the Cripple Creek output for January follows:

	Tons.	Ave.	Value
Smelters	9,980	$60	$ 598 800
U. S. R. & R. Co	25,000	30	750 000
Economic	5,000	32	160,000
Dorcas	3,180	30	94,400
Portland	8,100	28	226,800
Santa Rita	400	6	2,400
Other cyanide mills	1,000	5	5,000
Total	52,660		$1,837,400

General Manager C. B. Burch, of the Little Giant Mining & Milling Co., whose new 150 daily capacity cyanide mill in Pony gulch, three miles from Cripple Creek, was destroyed by fire, has started to clear away the debris preparatory to re-building. The new plant will be completed in May. It will be constructed of iron and the capacity will be increased to 300 tons daily.——The Stewart Leasing Co., which was compelled to suspend operations on account of the destruction of the shaft-house, machinery and gallows frame by fire on the Dexter property on Bull hill, has cleared away the ruins and the construction of the new shaft-house, ore-house and gallows frame is nearly finished.

J. K. Walsh and associates have found a good ore shoot at a depth of 600 ft. in the Forest Queen mine, on Ironclad hill, Cripple Creek.——C. J. Weiter, superintendent for the Ironclad Leasing Co., working the Finn property, on Tenderfoot hill, Cripple Creek, has sunk the shaft to a depth of 250 ft. and will continue it to 400 feet.

IDAHO.

Ada County.

The Celtic Gold Mining Co. is preparing to put in a small cyanide plant on its property in the Black Hornet district, 10 miles from Boise.

Boise County.

Efforts made last week to thaw out the tanks and start up at the Black Pearl mine, near Pearl, proved a failure, and everything has been closed down at the mine for the present.

Elmore County.

The owners of the Hillside mines are preparing to put in a cyanide plant at the Tahoma mine at Atlanta.

Lemhi County.

A new 100-ton stamp-mill has arrived at Red Rock, near Salmon, for the Singiser mine.——The Kitty Burton Mining Co., whose mill near Salmon was burned a short time ago, has resumed operations with 5 stamps and will have 10 more stamps ready soon. —— The machinery for a new 10-stamp mill to be erected by the Rabbit Foot Mining Co., on Silver creek, near Salmon, is on the ground. ——The owners of the Ramey mine at Salmon, who have just completed a 10-stamp mill, are arranging to add 30 more stamps and to equip a complete reduction plant.

Shoshone County.

The new mill at the Golden Reward mine, near Murray, will begin operations on February 15.——Manager C. R. Crysler of the Wake-Up-Jim mine, two miles from Murray, has chosen a site and will put in a 40-stamp mill in the spring.——An additional contract for a 50-ft. extension of the tunnel at the Silver Star mine, at Mullan, has been let by the company. The tunnel is now in 321 ft.——The owners of the You Like mine, near Wallace, have begun drifting on a new orebody. ——Work has been resumed on the Ruth mines, on Ninemile creek, near Wallace. The deep-level crosscut tunnel will be extended.

MONTANA.

Fergus County.

At Kendall the Barnes-King tunnel from the workings near the mill is in 5,000 ft. and has opened up some good ore. The tunnel is to run 2,000 ft. farther.

Jefferson County.

Ray & Kidney have been granted a new lease on the Columbia mine, north of Bernice.

Missoula County.

At the Tarbox mine, near Saltese, the management is pushing the winze from the 500 to the 600-ft. level. On the 400-ft. level a shoot of concentrating ore has been opened. Manager Daxon will put in a concentrator next summer.

Powell County.

The crosscut tunnel being run by the Montana Co., Ltd., owning claims 12 miles from Bonita, has been run 150 ft. from the bottom of the 200-foot shaft. R. S. Ellingsworth is manager.

Silver Bow County.

(Special Correspondence).—The Old Glory Copper Co. has acquired an interest in the Old Glory mine in Butte, of which F. A. Heinze owns a portion. The Old Glory was developed for silver many years ago but the operators struck copper at a depth of 400 feet and quit the property. During the past two years J. Benton Leggat has been prospecting the ground for copper and opened several veins which carry a fair percentage. The mine has not yet produced anything.——The Butte & London Copper Co. is making good progress in sinking a shaft on the Greendale. At a depth of 10 feet a vein was cut showing a good streak of copper ore.—— The West Butte Mining Co. was organized for the purpose of operating the Columbia mine which lies west of Butte and upon which there is a good sized shaft. Years ago the mine was worked for silver and about $100,000 worth of ore was mined from within 100 feet of the surface. The bottom of the shaft is in a copper-silver vein. The company has options on other properties. Several Boston men are interested in the West Butte.——The hoisting engine of the North Butte Co. has been repaired and the company is again hoisting about 1,020 tons of ore a day. While the damage to the engine was being repaired the Speculator ore was hoisted through the High Ore mine. The 1,020 tons of ore now being mined runs between 6% and 8% copper.——It is generally reported that John D. Ryan of the Amalgamated Copper Co. has secured an option for $1,000,000 on the mines of the Alice Gold & Silver Mining Co. The Montana Zinc Co. had an option on the mines, about 17 in number, a year ago, for something like $250,000, but allowed the option to lapse. At that time there had been no big strikes of copper in that section of the district and the Alice mines were generally regarded as old and worked out silver properties. The Alice has been mined to a depth of 1,500 feet, at which point a body of black zinciferous ore was cut which could not be mined and worked by the company except at a great loss. The Walker Brothers, of Salt Lake, are the principal owners of the Alice and they declined to invest any money for prospecting and the mines were closed. Except for little workings by leasers the mines have not been operated for a number of years. They lie northeast of the North Butte mines. ——Copper has been struck in the Poser mine, another old silver property, lying far north of the Alice group. The Poser has been worked for gold and silver for 20 years.

Butte, Jan. 5.

The Butte Copper Exploration Co., which was recently formed to take over the Six O'Clock mines, near Butte, has announced its intention of sinking the shaft on the Six O'Clock mine to the 1,200 or 1,500 level.

Manager Wethey, of the Butte Reduction Works at Butte, states that it will take nine months to repair the damage caused by the fire in the reduction works last week. He places the loss at between $250,000 and $300,000, with $200,000 insurance. The crushing machines at the plant were entirely destroyed.

NEVADA.

Esmeralda County.

The 30-ton Kinkead mill at Columbia has been started under the direction of Harry J. Kinkead.

It is expected that that the tubemill at the Combina-

tion mine, at Goldfield, will be running by February 15. It has a capacity of 40 tons daily, crushing to 200-mesh. At the same time the additional ten stamps, recently installed, will be started. The present 10-stamp battery is crushing 250 tons per week.——A 12-h.p. gasoline hoist has been put on the Diamondfield-Triangle property. ——Hugh Nelson and George A. Nelson state that they will build a sampling plant having a capacity of 200 tons per day at Goldfield.

A new discovery of high-grade ore is reported in the Palmetto district, 20 miles south of Goldfield and two miles west of the old Palmetto mill.

Eureka County.

The American Smelting & Refining Co. has bought the iron mine at Gerald, on the Southern Pacific, six miles west of Palisade.

Humboldt County.

The mines of the Willow Creek Mining Co., at Rebel Creek, which were sold recently, are to be equipped with a 200-ton plant and concentrators. The plant will be operated by electricity.

Lincoln County.

(Special Correspondence).—To the east of Las Vegas, along the Colorado river between 25 and 35 miles, near Callville, a large number of locations of free-gold ledges have been made. Some of the assays are high. While a number of the locators claim to have mines, the other fellows say the indications are good. From the number now there, and others going daily, the indications are good for a 'rush.' This belt is reported to be on both sides of the Colorado river, and the Arizona side is also being staked. —— The oil excitement to the northwest in this county is not so much talked of, but those having locations seem to be perfecting their entries.——There are some locations being made on what is called 'the Summit,' to the south and east from 10 to 20 miles. The assays so far are gold, silver, copper and lead.——Some work is being done to the northwest in Spring mountains on lead and zinc outcropping.——The steel on the Las Vegas & Tonopah Railroad is laid about 25 miles out and progressing very fast.

Las Vegas, Feb. 5.

The Searchlight Copper Gold Co. has given a contract to John Howe for 200 ft. of sinking on the Oom Paul claim at Searchlight. After the first half of the contract has been completed, a hoist is to be put in, and when the present contract has been completed, drifting and crosscutting will follow. The Searchlight Mining & Milling Co. has resumed work. Sinking will be started when the mill is completed.——The Searchlight Mutual Mining Co. will begin work on the American Girl claims at Summit Springs near Searchlight.

Nye County.

Ore is being sacked and shipments are soon to be made from the 400-ft. level of the Ohio-Tonopah, at Tonopah. Prescott Ely is superintendent.——The ore shipments via the Tonopah Railroad for the week ending February 2 were as follows: Tonopah Mining Co., 1,115 tons; Montana, 130 tons; Tonopah Extension, 698 tons; Belmont, 170 tons; Midway, 92 tons; West End, 42 tons; Briggs & Evans, 40 tons; Nevada Alpine, 29 tons; Duncan, Olson & Hedge, 15 tons.——The actual tonnage of ore shipments sampled by the Western Ore Purchasing Co., at Miller's, for the week ending February 1 was as follows: Tonopah Mining Co., 720 tons; Tonopah Extension, 583 tons; Belmont Development Co., 171 tons; Montana-Tonopah, 110 tons; Tonopah Midway, 91 tons; Goldfield district, 273 tons; Manhattan district, 31 tons; Hannapah, 17 tons. Total 1,978 tons.

It is expected that Bullfrog will be connected with the outside world by railroad not later than June 15. ——Track laying on the Las Vegas & Tonopah Railroad began at Las Vegas on the Clark road on January 4. Track material for 75 miles of road is now at the yards of the company at Las Vegas, and graders and track layers are pushing construction work. Eight days after beginning work, 10 miles of track had been laid, thus averaging 1¼ miles per day. The first point to be reached is Indian Springs, 40 miles from Bullfrog. When that point is made it is the intention of the railroad management to establish a line of freighters, to handle the business of the district temporarily, and also to maintain a passenger automobile line. It is promised that the rate on general freight will be 24c. per lb., which is a reduction of 1c. over the rate that has prevailed for some time from Las Vegas to that point.

A small compressor is to be put in at the National Bank mine at Bullfrog and the shaft will be continued 150 ft. from the 200-ft. level, running crosscuts every 50 ft. Superintendent E. H. Wedekind states that a mill is to be put up.——The No. 1 tunnel of the Gibralter at Bullfrog is in 360 ft. The No. 2 tunnel is in 225 ft. There are 700 sacks of ore stacked from this tunnel. The two tunnels are to be connected with an upraise. ——The Big Bullfrog crosscut is in 100 ft. from the 150-ft. shaft.——The Montgomery-Shoshone shaft is being sunk to a depth of 275 ft. and the Polaris to a depth of 200 ft. Connection will be made between the two shafts by a drift 471 ft. long. Awaiting shipment are 180 tons of ore to follow the last shipment of 30 tons, which will average between $225 and $250. The mill, of not less than 80 stamps, will be ready to bring in as soon as the railroad is completed, which is expected to be about June 1.

The following are the distances, taken by odometer, from Bullfrog to other points by stage, as published in the Bullfrog *Miner*: South—John Brunk's, 18.15 miles; Miller's Camp, 29.25; Ash Meadows, 38.50; Mesquite, 46.40; Fork Road, 51.65; Summit (no water), 63.15; Indian Creek, 79.15; Corn Creek, 100.15; Tule Springs, 111.15; Las Vegas, 124.15. North—Mud Springs (Currie's), 9 miles; Thorp's Mill, 31; Midway Station, 42; The Tanks, 52; Goldfield, 66; Tonopah, 94. Northeast—Rhyolite, 1.1 mile; Beatty, 5. East—Gold Center, 4.3 miles. Population of district, embracing the towns of Bullfrog, Rhyolite, Beatty, Gold Center and Original Bullfrog—estimated at 5,000. Cost of travel—To Goldfield, by stage $20, by auto $25. To Las Vegas by stage $25, by auto $40. Time consumed by stage in going to Goldfield, 12 hours; to Las Vegas, two days and one night; time consumed by auto to Goldfield, 7 hours; to Las Vegas, 10 hours.

Washoe County.

It is proposed to build a custom stamp-mill on the banks of the Truckee river at Wadsworth to reduce ore from the mines in the White Horse district. The mill could be run with electric power from the Wadsworth Light & Power Co.

White Pine County.

The White Pine Mining Co., consisting of Reno and Chicago people, has purchased six placer claims of 20 acres each from J. L. Wedekind and Jacob Mayer. The claims are in the Ruby Mountain district, 53 miles northeast of Eureka. The company has let a contract for the construction of a dam. The claims will be worked on a large scale with giants.

NEW MEXICO.

Grant County.

The Burro Mountain Copper Co. has put in an electric power and lighting plant on its property at Leopold, to supply light and power to its mine and mill.

The Comanche Mining & Smelting Co. is planning the construction of additional smelting furnaces of 250 tons capacity on its property near Silver City.

Luna County.

The *Mining Reporter* says that this county contains five mining camps. Cooks Peak is 20 miles north of Deming between the station of Cybar on the main line of the Santa Fe, and Faywood, on the Silver City branch. Florida district, is 12 miles southeast of Deming. Tres Hermanos district is 25 miles due south of Deming and near the Mexico line. Victorio district is 19 miles west of Deming, near the station of Gage on the Southern Pacific Railway. Carrizalillo district is 35 miles southwest of Deming, near the junction of the El Paso & Southwestern Railway. Lead is the most valuable mineral produced and is found in paying quantities in all the camps, except Carrizalillo, which is a gold camp. Zinc and silver are the next in importance, and some copper has also been discovered. The building of the Luna Lead Company's Smelter at the county seat, Deming, gave a great impetus to mining in Luna county. At Cooks Peak the ore is mainly lead carbonate. Among the main mines are the Desdemona, Otello, Monte Cristo, Graphic, Teel, Poe, Lead King group, Contention group, Wisconsin, Mocking Bird, Cleveland, Excelsior, Roosevelt, Big Galena, Monitor, Bonanza, Dewey, Olympia and Alto. This district is credited with a production in excess of $3,000,000. At Florida district lead-silver ore is the main mineral also, and the Silver Cave claim is credited with a production of $60,000. Among the other claims of prominence are Pocahontas, Sun Rise, Sun Set, Bear, Tiger, Iron Mass, Lead Carbonate and Roosevelt claims. There are a number of promising copper claims in this district also. In Tres Hermanos district the principal ore is also lead-silver ore and the formation is similar to that in the Florida district. The principal mines are the Cincinnati, Heetty, Hancock, Yellow Jacket, Contention and Johnston. Victoria district is credited with having produced $1,500,000 mainly in silver and lead. The St. Louis and Chance mines are the ones that made this district famous. Wolframite is also found in this camp. In the Carrizalillo district the main work has been done by the Golden Cross and Eagle Mining company and by Merril and Byron. This camp has abundance of wood and water. The Faywood Lead Co. have installed a pneumatic concentrator at their mines at Cooks Peak.

Otero County.

The owners of the Lucky mine, near Oro Grande, in the Jarillas district, are installing machine drills on their property.

Santa Fe County.

J. A. Wood, manager of the Gold Bullion Mining Co.'s placer workings at Golden, is putting in new machinery.

OREGON.

Baker County.

The owners of the California mine, at Cable Cove, have decided to remodel the mill and to complete the working tunnel.——The crushing capacity of the mill at the Tabor Fraction, at Bourne, is to be increased by adding rolls, and a saving of values will be made by putting in trommels, screens and settling tanks.

James A. Panting, owner and manager of the Gold Hill mine, near Durkee district, has let a contract to W. H. Potter to move his stamp-mill from its present location on the creek one-half mile to the mine.

Jackson County.

The Bill Nye mine, near Gold Hill, has been wired for electricity.

Josephine County.

J. L. Pennington is on Josephine creek, superintending the development of the Gold King quartz mine, near Kerby.

SOUTH DAKOTA.

State Mine Inspector Nick Treweek of South Dakota is at work upon his annual report covering the operations of the mines for 1905. In his judgment, based upon figures which he has collected up to the present time, last year will show an increase over the year 1904. Although the Government figures show a decrease as given out by Director of the Mint Roberts, Mr. Treweek believes he is in error, arguing that the increase of Homestake production alone would more than offset any loss in other quarters. A portion of the figures which have been collected by Mr. Treweek are as follows: Horseshoe, $254,745; Maitland, $288,000; Imperial, $251,000; Wasp No. 2, $100,000; Clinton, $86,471; Portland, $14,000; Monarch, $4,500. In addition to these quoted, there are a number of other companies to hear from, including the Clover Leaf, Hidden Fortune, Dakota, Homestake, Golden Reward, Spearfish, Golden West, Gilt Edge-Maid, Mainstay and Puritan. The present year will show an increase over the year just closed. A number of mills now being constructed will be in commission within the next few months. These include the Victoria, Safe Investment, Branch Mint and Eleventh Hour.

Lawrence County.

The new power plant which has been completed at Pluma by the Consolidated Light & Power Co. has a stack 210 ft. high of steel and concrete and a battery of seven boilers, with a capacity of 2,200 boiler horsepower and a total electrical force of 6,000 h. p. The company is building a pole line 30 miles long to connect mines in the Northern hills with the plant. Already the Lundberg-Dorr mill at Terry is using this electrical power. The Gilt Edge-Maid has electrical power for its mill and hoist. This company and the Rex Mining Co. have the only electrical hoists in the Black Hills. A line is being built for a pumping station at Ben Hur, one of the Horseshoe company properties, and it is expected that by June the work of connecting the various mining companies with the plant will be completed. It is estimated that the company will be able to furnish power for from 20 to 50% cheaper than it can be produced at the individual lines. The cost to the mining companies of the power to mill their ore is from 30 to 36c. a ton, and electrical power can be furnished for from 19 to 25 cents.

UTAH.

Salt Lake County.

Under the new management of the Butler-Liberal at Bingham it will not be necessary to use the hoisting plant for the removal of waste from the mine. Arrangements have been made with the Red Wing for dump room and all the material will be taken out through the tunnel, as was formerly the case.

Those in charge of construction at the new Garfield smelter are confident they will have a portion of the works ready to commence smelting ore May 1. There are 1,500 men on the payrolls. Three buildings have been completed—the machine shop, carpenter shop and warehouse. The steel frames for the sampling and sulphide mills are ready to be sided and roofed. Good progress is being made with the construction of the power-house. The steel frame is up and the brick walls are being built. The main building, which is to cover ground space of 300x360 ft., is well under way. The men building the 300-ft. stack are within 40 ft. of the top. The Utah Construction Co., which has been making all the excavations for the buildings and railroad trackage, is working with a reduced force and in another month will have its work practically finished. The Rio Grande Western has completed the grading of its branch line to the smelter yards, but it will possibly be a month before it begins to deliver freight to Garfield. The smelting company is still making excavations and grading a roadbed for its tracks.

Summit County.

The Odin Mining Co., of Park City, is extending its tunnel at 200 ft., further paralleling the main ledge.

WASHINGTON.

Ferry County.

S. P. Clark is extending the tunnel on the Unga group, in the Wauconda mining district, 12 miles west of Republic. The tunnel is being driven to connect with a shaft sunk on the ledge.

King County.

Work on a 12-mile spur to connect the Dutch Miller mine on Foss river with the Great Northern Railroad, four miles east of Skykomish, will begin April 1. The road will be built by the Seattle-Boston company of Seattle in exchange for a certain amount of the ore from the mine. The Dutch Miller is a copper mine on Foss river. The company will also build a tramway up the mountain to the mine. The Dutch Miller last season worked 14 men.

Okanogan County.

The Favorite Mining Co. has decided to run the tunnel at the Favorite mine, near Nighthawk, 500 feet further, and is now receiving bids for the work.——Manager Andrus of the Six Eagles mine, at Nighthawk, is adding new machinery.——John Boyd, president of the Palmer Mountain Tunnel & Power Co., of Loomis, states that the company has started a 300-ton stamp mill and a cyanide plant at Palmer Mountain. Electric drills and an electric haulage system are being installed. ——The Grand View Mining Co. has completed its 20-stamp mill at Palmer Mountain, near Loomis.

Charles H. Ballard, manager and principal owner of the Mammoth mine, in the Slate Creek district, states that there has been but little work done in the Slate Creek district this winter, but the arrangements that are now being made for the opening of spring promises a year of unusual development. The Mammoth mill will resume operations in May, and the power plant being constructed by James Cady and associates will be completed early in the season and will furnish power to the Chancellor and other mines of the district. Most of the concentrates for the operation of the past season have been stored, owing to the poor transportation facilities. The proposed lines of the Great Northern from Wenatchee to Oroville to connect with the boundary system, while running through the Okanogan country, will to a certain extent give the Slate creek better transportation facilities. It will eliminate the necessity of transporting freight by the Columbia river and shorten the distance necessary to operate pack trains at the present time.

Shohomish County.

Swan & McCain, of Spokane, have completed the installation of electric drills and lifts in the mine of the Sulphide Mountain Mining & Milling Co., 12 miles northeast of Orient. Other improvements just completed at the mine include a new boiler and hoist and two steam pumps.

Stevens County.

The Togo Mining Co. is developing claims 18 miles west of Springdale and one mile northeast of Deer Trail. The main tunnel is in 350 feet.

W. S. Magney, manager of the National Mining Co., at Northport, will begin work at the mine within a few weeks.

WYOMING.

Carbon County.

George H. Hand, the newly appointed superintendent of the Penn-Wyoming Co., will commence operations at the mines and at the reduction works, where extensive alterations will be made, including increasing the capacity of the smelter and the installing of a steam plant to enable the works to continue operations during the winter months. The proposed work includes operations at the lately acquired Doane-Rambler at Rambler, which shut down after its absorption by the Penn-Wyoming. A 3-mile tramway will be built to connect the Doane-Rambler with the main tramway to the Ferris-Haggerty mine to bring ore to the smelter.

FOREIGN.

AUSTRALIA.

The gold yield of Australia for 1905 amounted to 4,127,991 oz., valued at £17,544,000, as compared with 4,215,239 oz., valued at £17,915,000, in 1904.

New South Wales.

The gold output of New South Wales for December amounted to 27,763 oz., valued at £108,007, as compared with 40,414 oz., valued at £121,373, in the corresponding month of 1904. The output for the twelve months of 1905 amounted to 328,747 oz., valued at £1,165,013, as compared with 324,996 oz., valued at £1,146,109, in 1904.

Tasmania.

The report of the Mount Lyell Mining & Railroad Co., Ltd., for the six months ending Sept. 30, 1905, states that the company's mines produced 212,158 tons of ore, an increase of 6,284 tons over the preceding period. Of this amount, 208,282 tons (assaying 2.37% copper, 1.84 oz. silver and .058 oz. gold) were treated with 22,237 tons of purchased ore, metal-bearing flux, metallurgical residues, etc., resulting in 12,843 tons of matte (assaying 40.16% copper, 32.85 oz. silver and 1.139 oz. gold). This was blown to blister copper, amounting to 4,306 tons, and containing 4,253 tons refined copper, 365,440 oz. silver and 12,425 oz. gold, which showed an increase over the previous half-year of 303 tons copper, 1,189 oz. silver and 560 oz. gold. The cost of producing blister copper was $3.227, against $3.113 for the six months ending March 31, 1905, on account of the increased cost of mining in the North Mount Lyell mine. In this mine, which is of more recent development, considerable diamond drilling has been done, and much light has been thrown upon the position and extent of orebodies in the lower levels. The holes were drilled at each level, from the first to the seventh, inclusive, with varying results, the most satisfactory being at the 700-ft. level, where an orebody of considerable size was located. Underground exploration in all of the company's mines consisted of the following: Driving and crosscutting, 1,629 ft.; sinking and raising, 557 ft.; diamond drilling, 1,887 ft.; total, 4,073 ft. Of this total, 3,745 ft. was in the ground of the North Mount Lyell mine. Electric power is being substituted wherever possible. At the last named mine there is an electrically driven hoisting engine, and at the power plant there are two 400-k.w. steam turbine generator sets giving perfect satisfaction. On the average, four blast furnaces have been running continually during the period covered by the report, and have treated a larger tonnage than that of the preceding six months. Besides their mining operations, the company conducts a coke plant at Port Kembla, N. S. W. (which furnishes the entire coke supply for smelters and power plant), manufactures superphosphates and sulphuric acid at its chemical works, and operates railways, all of which enterprises are on a paying basis.

Queensland.

The Queensland gold returns for December (with calls made and dividends paid) were as follows:

	Tons Crushed.	Yield in Oz.	Calls.	Dividends.
Charters Towers	21,900	20,000	£6,500	£35,300
Croydon	1,200	700	300	.....
Gympie	21,100	13,600	3,600	4,200
Mount Morgan	20,000	9,400	.....	12,500
Ravenswood	3,300	3,100	500	.....
Other fields	6,200	2,500	.....	.....
Alluvial	.....	1,100	.....	.....
Total	73,700	50,400		

Victoria.

The Victorian gold yield for 1905 was 810,050 oz.

CANADA.

BRITISH COLUMBIA.

Boundary District.

The following official figures regarding the work done at the British Columbia copper company's Greenwood smelter for 1905 have been given out. The amount of ore treated amounted to 210.830 dry tons, the amount of custom ore received being 16,357 tons, the balance coming from the company's Mother Lode mine in Deadwood camp. The smelting tonnage figures for each month were as follows: January, 17,725; February, 16,634; March, 19.563; April, 15,866; May, 19,698; June, 18,413; July, 15,675; August, 18,561; September, 18,606; October, 18,374; November, 17,726; December, 13,989; 1905 tonnage treated, 210,830. The custom ore received during the year was as follows: Copper King, Chewelah, 183 tons; Le Roi No 2, Rossland, 5,039; Mountain Rose, Boundary, 3,269; E. P. U., Boundary, 121; Emma, Boundary, 2,417; Snowstorm, Idaho, 472; Sudbury, Boundary, 26; Mountain Lion, Republic, 198; Ben Hur, Republic, 1,261; Butcher Boy, Boundary, 8; Last Chance, Boundary, 58; Napoleon, Boyd's, 3,227; Ymir, Ymir, 78; total, 16,357 tons.

The Boundary smelting record for seven days was broken during the week ending Feb. 3. The several mines sent out ore as follows: Granby mines to Granby smelter, 18,079 tons; Mother Lode to British Columbia copper smelter, 2,976 tons; Brooklyn Stemwinder to Dominion copper smelter, 2,561 tons; Rawhide to Dominion copper smelter, 119 tons; Sunset to Dominion copper smelter, 710 tons; Oro Denoro to Granby and Dominion copper smelters, 732 tons; Emma to Nelson and British Columbia smelter, 231 tons; Providence to Trail smelter, 70 tons; total shipments for week, 25,478 tons; total for year to date, 104,474 tons. The following is the weekly treatment report from the three district smelters: Granby smelter, 19,088 tons; British Columbia Copper Co. smelter, 4,036 tons; Dominion copper smelter, 3,570 tons; total treatment for week, 26,694 tons; total treatment for year to date, 111,039.——Power over the West Kootenay Power & Light Company's recently completed high-tension electric lines from Bonnington Falls was utilized last week at the Granby smelter in Grand Forks. At first only a few hundred horsepower will be used, the Granby Consolidated having a water power of its own, as well as power from the Cascade Water, Power & Light Co. at Cascade, which has so far furnished all the long-distance power used by the mines, smelters and cities of the Boundary. The transmission of the Bonnington power gives an assurance against power shortage this winter, as occurred last winter when the Kettle river reached its lowest stage in years. Electric power has been turned on at the new air compressor of the Dominion Copper Co., Ltd., which is being installed at the company's Rawhide mine in this camp. This power is furnished by the Cascade Water, Power & Light Co.

The prospects for mining and smelting in the Boundary show that much new work will be undertaken in both low and high grade properties now operating, with others expected to resume, and the smelting capacity of the three Boundary reduction works will be increased from 25 to 40% before the year is closed. At present the daily output of ore runs between 3000 and 4000 tons, and from contracts already awarded for smelters' enlargement, it will be between 4000 and 5000 tons daily by the end of the year. At the Granby mines in Phœnix camp, the new main three-compartment incline shaft will soon break through to the surface, and the 250-h.p. electric hoist, capable of lifting five-ton loads from a depth of 1000 ft. or more, will be put in soon. An ore crusher, with a capacity of 3000 tons in 24 hours will go in on the Canadian Pacific Railway tracks, and will take the place of a similar crusher destroyed by fire in December. At the Granby's Gold Drop and Monarch claims, adjoining the main group, preparations are being made for taking out and shipping a large tonnage. At the former a sidetrack has been put in by the Canadian Pacific Railway, and ore bins have been built by the Granby people, which are connected with the No. 3 tunnel at the Gold Drop by a 600-ft. tramway. In another month the Gold Drop will add its ore to the general shipments from the Granby, and in the spring a 'glory hole' or open quarry will be opened on the property. At this property another large crusher may be installed this year. On the Monarch, in addition to the open work done last year, a shaft has been sunk 100 ft. and crosscutting is now going on. This property can also add largely to the Granby output when needed.

Rossland District.

The report of Le Roi No. 2, Ltd., at Rossland, for the year ended Sept. 30, 1905, states that ore and concentrate are smelted at the Greenwood and Trail smelters. The two smelters treated 9,013 and 3,224 tons of ore, respectively; the total charge for freight and treatment was $8.70 per ton. This was $1.06 higher than for the previous year, due to the increased value of the ore. Development on the Josie mine during the year comprised 2,685 ft. of drift and crosscut; 279 ft. raises and winzes, and 3,121 ft. of diamond-drill holes, costing $2.70 per ft. There were also stations cut amounting to 645 cu. yd. During the year the company has acquired eight properties in the vicinity of its own claims, two in the Rossland district adjacent to the Velvet mine, and five in the Ymir district. Concentration for the year was entirely by water, and resulted in an improvement over the previous year. The output was 425 tons of concentrate, averaging 2.54 oz. gold, 2.22 oz. silver and 2.61% copper; the smelter receipts for the same being $22,408. The total ore produced was 34,298 tons, which, after hand-sorting, was divided into 12,237 tons shipping ore, 10,678 tons second-class ore, and 11,293 tons waste. The total cost of ore, including diamond drilling, amounted to $4.222 per ton; this, with an additional charge of $3.38 for depreciation and equipment, brings the final cost to $7.60 per ton (calculated on a basis of 19,789 tons actually taken from the mine during the year). The decrease in output of the mine for the year was due to the restriction of work during the latter half in order to push exploration. The ore shipped, amounting to 12,237 tons, carried 14,493 oz. gold (1.184 oz. per ton); 28,369 oz. silver (2.318 oz. per ton); and 885,992 lb. copper (72.4 lb. per ton or 3.62%). The value of this ore was $35.78 per ton, as contrasted with $24.80 for the previous year.

Vancouver Island.

It is reported that ore has been struck at the 1,000-ft. level of the Tyee mine, on Mt. Sicker, 11 miles northwest of Duncan.

ONTARIO.

Announcement was made at the recent meeting of the Canadian section of the Society of Chemical Industry that in the spring a company would invest $1,500,000 in a plant to utilize the silver ores of Hastings county and to extract sulphuric acid by the contact process. Mr. Nieghorn, manager of the Canadian Chemical Co., London, made the statement. The plant will be near Tweed.

A move of importance to New Ontario, the refining of Ontario nickel in Ontario, instead of the United States, is to be forced by the Whitney regime. The adoption of the policy has been urged ever since the discovery of nickel at Sudbury. Announcement is made by the minister of mines of Cochrane that at the coming session of the legislature he will introduce legislation proposing that all the nickel mined in the province must not only be washed here, but converted into its marketable state, as well. At present the ores obtained in the Georgian Bay region are smelted and converted into matte at Copper Cliff. Something like 200,000 tons of matte annually are sent to Constable Hook, N. J., where they are subjected to further treatment and transformed into commercial nickel.

MEXICO.

Following is a translation of the recent order regarding mining locations: Department of Fomento, third section. Owing to complaints having been made by some foreigners to whom titles have been granted to exploit mines in the State of Sonora and the northern district of Lower California that they do not enjoy security and protection to work their properties, and having slandered the respective authorities in that they do not extend them protection, the president of the Republic has ordered that for the present and until further orders there shall not be admitted in the mine agencies of the same States and districts applications to acquire mines that may be presented by foreigners. This I communicate to you to the end that you do not admit any application whatsoever presented by foreigners for mines within the jurisdiction of your agency; at the same time you must suspend further action in all applications that come within this ruling. You will acknowledge receipt of the present communication and advise that you have informed yourself of the same for its immediate compliance. You must transmit to this department a detailed statement of all applications refused by you, as well as of those that you suspend, which come under this ruling. By order of the acting secretary.—Guillermo B. Puga.

Guanajuato.

Ignacio Ibarguengoitia, of Guanajuato, is preparing to substitute the cyanide process for the patio process in the reduction of his ores.

Jalisco.

The Boca Ancha mine, in the Parnasso district, 60 miles southwest of Ameca, is to be worked by the Boca Ancha Mining Co., of which Geo. E. Purnell, of Guadalajara, is manager. A 10-stamp mill and cyanide plant are to be put in and new development work started.

Sonora.

(Special Correspondence). — The railroad is being pushed from Batamotal, near Guaymas, to the Yaqui river, where it follows the river as far as Tonichi. Many of the mines are producing, but are not shipping on account of difficulty of transportation. The Buena Vista mine has been producing ore for the past year.——The Ubalama mine in running a tunnel 125 ft. took out 12,000 oz. in silver.——The Gold Coin Santa Rosa Mining & Milling Co. are operating their smelter.——The Indians are still quite active in their depredations in this section, but it is believed that when the railroad enters the field they will have to go farther into the interior, as the Government will be called upon to protect the railroad interests, and people can then enter the district without fear of being molested.

San Javier, Feb. 3.

The Veta Grande Mining Co. has ceased operations at the Veta Grande mine, near Cananea, owned by James Finch.——The headquarters of the Greene Gold-Silver Co. are to be removed from Temosachic, the western terminus of the Chihuahua & Pacific railroad, to Santa Tomas, on the same line.

Books Received.

'The Nature of Ore Deposits,' by Dr. Richard Beck, translated and revised by Walter Harvey Weed, is a work which is certain to provoke interest among students of ore deposits. Dr. Beck's original book, in the German, had already won a high reputation before Mr. Weed widened the usefulness of the treatise by translating it into English. The opening chapter, on magmatic segregations, in which the author reviews the work of Kemp and Vogt, forms an excellent introduction. Mr. Weed has given a sympathetic rendering of the original and he has added illustrations, with data, which tend to bring Dr. Beck's book in closer touch with recent developments. It is to be regretted that the mechanical part of the book-making is not better; the printing is not as good as it ought to be, the second volume opens in the midst of a chapter, a Procrustean method by no means necessary. Clayton's law is wrongly quoted; what he said was that the ore-shoots conformed in pitch to the striations on the vein-walls. Certain cuts are wrongly labeled; Fig. 103 is a normal, not a reverse, fault. Some of the chemical equations do not balance and several statements appear to include arithmetical errors. The retention of Germaa terms on illustrations of American lode-occurrences annoys the reader. However, in making these criticisms, we desire mainly to emphasize the fact that in these days, when poor fiction is published in beautiful dress and with the highest effort of the printer's art, there is no excuse for issuing a valuable and expensive treatise such as this so poorly printed and insufficiently proof-read. Despite these drawbacks, the book is bound to be welcome to specialists in ore deposits and to progressive mining engineers. It is published by the *Engineering and Mining Journal* of New York City, and will be sent postpaid by the MINING AND SCIENTIFIC PRESS for $8.

Trade Treatises.

The Richards' Rapid Economy Stamp Mill Co., Examiner Building, San Francisco, illustrates and describes their mill in a neat catalogue.

Smith, Emery & Co., 83 New Montgomery St., San Francisco, send a folder listing the classes of analytical work for which they are prepared.

The 'Application of Electricity to Mining' forms a handsomely illustrated bulletin from the Jeffrey Manufacturing Co. of Columbus, Ohio. Typical installations for electric haulage and coal mining are shown.

Personal.

F. W. BAKER is in New York.

F. L. BOSQUI has gone to Chihuahua.

H. A. SHIPMAN has returned to Denver.

N. C. BONNEVIE, of Denver, is at Chicago.

F. W. BRADLEY has returned from New York.

F. J. ESTEP of Oroville has been in San Francisco.

JAMES DOUGLAS has returned to New York from El Paso.

W. E. BASHAM, of Placerville, is at the California Hotel.

DAVID LEVAT of Paris is examining gold mines in Arizona.

W. H. KNOWLES, Denver, Colo., is visiting New York and Boston.

J. N. ESSELSTYN, of New York City, is at the St. Francis Hotel.

WM. M. BREWER, of the Tyee Copper Company, is visiting Tonopah.

R. C. GEMMELL has returned from Spain and is now at Salt Lake City.

W. H. WILEY passed through San Francisco on his way to Los Angeles.

ARTHUR THACHER of St. Louis is examining mines in the Indian Territory.

RUFUS M. BAGG, JR., has returned to Chihuahua, Mexico, from Los Angeles.

EDWARD STOIBER has left Denver for New York, and will shortly return to Paris.

W. H. SHOCKLEY, on his return from Siberia, is now examining mines in Nevada.

O. LONGACRE JR. is superintendent of the Poland Mining Co. at Poland, Arizona.

HENRY F. LEFEVRE has left New York to open an office at Managua, in Nicaragua.

EDWARD SKEWES, lately at Sonora, Cal., has gone to examine mines in Jalisco, Mexico.

CURTIS LINDLEY, JR., is now with the Nevada Consolidated Copper Company at Ely.

J. M. CALLOW is on his way to Europe, expecting to return to Salt Lake City on April 1.

JOSEPH LUXON has been appointed manager Cyrus Noble mine, at Searchlight, Nevada.

J. W. CLEAVER, San Javier, Sonora, Mexico, has returned there from Denver, Colorado.

C. M. FUELLER, Denver, Colo., is examining mines at Wickenburg and Tombstone, Arizona.

F. H. CARNAHAN is superintendent of the Blue Ledge copper mine, near Jacksonville, Oregon.

EDWARD M. L. ENGLE has charge of the Mount Union Consolidated mine at Walker, Arizona.

SAML. A. PARNALL is said to have resigned as manager of the Bonanza Circle mines at Bisbee.

DAVID GOODALE is manager of the Minas de Cobre de Rio Tinto, at Terrazas, Chihuahua, Mexico.

H. M. HALE has charge of the copper mine owned by W. B. RAMSDELL, of Los Angeles, California.

M. D. STACKPOLE, Denver, Colo., has charge of construction of a mill at San Luis Potosi, Mexico.

WILLIAM THOMPSON is with the Waterson Gold Mining Co., at Ocampo, in Chihuahua, Mexico.

HERMANN A. PROSSER, who was at Mammoth, Shasta county, this week, has returned to Salt Lake City.

FRED CARROLL, manager Atlas Mining Company, Ouray, Colo., has returned from Chicago and Denver.

A. STARK, manager of the Slough Creek placer mines near Barkerville, B. C., is visiting Oakland, California.

WILLIAM H. RADFORD, of San Francisco, is investigating dredging ground in Clear Creek county, Colorado.

JOHN T. MILLIKEN has been appointed superintendent of the remodeled Telluride mill at Colorado Springs.

JOHN H. FENNELL, lately on the staff of the Rio Tinto mines, has joined his brother, CECIL G. FENNELL, at Prescott, Arizona.

WALTER G. PERKINS, smelter superintendent for the Nevada Consolidated Copper Company, will remain in San Francisco a month.

E. J. WILSON has returned to Spokane after finishing the construction of the plant of the Arizona Smelting Co. at Humboldt, Arizona.

ARTHUR L. WALKER has gone to the Tacoma smelter, in his capacity as consulting engineer to the Guggenheim Smelter Securities Corporation.

W. S. MANN, engineer for the Montezuma Mines, Inc., of New York, has gone to Miramar, Costa Rica, C. A., to begin the construction on their new mill.

C. O. ELLINGWOOD, of Salt Lake City, has been elected to succeed WILLARD F. SNYDER, resigned, as president and general manager of the Western Exploration Company.

W. L. LIBBEY has resigned as president and general manager of the Brookfield Mining Co. in Queens county, Nova Scotia, and will take charge of mining interests in Chihuahua, Mexico.

METALS.

SILVER.—Per oz., Troy: New York, (by wire), bar silver, 65⅝c. per fine ounce; San Francisco, 65⅝c.; London, 30 1/16d. (standard ounce, 925 fine); Mexican dollars, 51@53c., San Francisco; 50½c., New York.

COPPER.—New York (by wire, average for week ending Feb. 8), Lake, 17.75@18c.; Electrolytic, 17.62@17.87c.; Casting, 17.50@17.62c. per pound. Mill copper plates, $21.00; bars, 21@24c. London: £77 spot per ton.

LEAD.—New York (by wire, average for week ending Feb. 8), $5.60 per 100 lb; San Francisco, pig, 6.55@6.78c. per lb.; pipe 8@8½c.; sheet, 9@9½c.; London: £16 5s. ℔ long ton.

SPELTER.—New York (by wire, average for week ending Feb. 8), $6.07 ℔ 100 lb.; London, £26 17s. 6d. ℔ ton; San Francisco, ton lots, 7c.; 100-lb. lots, 7¾c.

TIN.—New York, pig, $35.90@36.15; bar tin, ℔ lb., 42¼c.; pig, 39c. London, £164 10s.

PLATINUM.—San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $20.50 ℔ Troy oz. Platinum ware, 75@$1.00 ℔ gram.

QUICKSILVER.—New York, $40.00@$40.50, large lots; London, £7 5s 0d.; San Francisco, local, $37.50@39.00 ℔ flask of 75 lbs.

NICKEL.—New York, 48@60c ℔ lb.; ton lots, 40@47c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c.; dust, ℔ lb., 10c.; sulphate, ℔ lb., 4c.

BABBITT METAL.—San Francisco, No. 1, 10½c.; No. 2, 8c.; No. 3, 7½c.; extra, 17½c.; genuine, 32½c.; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 23.50c; San Francisco, Plumbers', 100-lb. lots 19.75c.

ALUMINUM.—No. 1, 99%, small lots, 33@37c. ℔ lb.; 100 lbs., 35c.; 1000 lbs., 34c.; ton lots and over, 33c., Pittsburg. No. 2, 90%, small lots, 34c.; ton lots and over, 31c, Pittsburg.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $18.50; gray forge, $17.25; San Francisco, bar, 3½c. ℔ lb., 3¾c. in small quantities.

STEEL.—Bessemer billets, Pittsburg, $26.00 open hearth billets, $27.50; San Francisco, bar, 7c to 13c ℔ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 8½c.; less than 500 lb., per lb., 8¾c.; in 25-lb. tin pails, ½c. ℔ lb. above keg price; in 1 and 5-lb. tin cans, 100 lb. per case, ½c. per lb. above keg price. Dry Lead.—In bbl., 1 ton and over, 8c.; do. in kegs, 8½c.

LIME.—Santa Cruz, $1.35 country, $1.25 city ℔ bbl.

CEMENT.—Imported, $3.00@4.00 ℔ bbl.; California, carload lots, $1.80 f. o. b. at works; small lots, $2.10 ℔ bbl. in sacks, 4 sacks to bbl., 5c for each sack returned.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00;shingles, $2.50 for No. 1, and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $1.85; Cut, $1.75. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d, Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4d and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

GENERAL SUPPLIES.

ANTIMONY.—New York, per quality, 14c@15c; San Francisco, 1000-lb. lots, 14c; 300@500-lbs. 12c, 100-lb. lbs. 12c; 100-lbs lots, 13c.

BONE ASH.—Extra No. 1, 6c ℔ lb; No. 1, 5c½.

BORAX.—Concentrated, 9½c ℔ lb; powdered, 10c; fused, 25c; crystal, refined, 8c.

CANDLES.—Standard Oil Co.—Electric light, 16 oz., 11c; 14 oz., 9¾c; 12 oz., 8½c; 14 oz., 7¾c; Hotel, 12 oz., 9c; Granite (mining), 16 oz., 11½@11¾c; 14 oz., 10@10½c; 12 oz., 9½@9¾c; 10 oz., 8½c; Paraffines, White, 1s, 2s, 4s, 6s, 10½c; 12s, 11c; colored, 1c higher; Radiant Paraffines, 4s, 6s, 14 oz., 9½@9¾c; 10 oz., 7¾c.

CAPS.—3x, $5.50@6 per 1000; 4x, $6.50@7; 5x, $8@8.50; Lion, $9@9.50, in lots not less than 1000.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3½c ℔ lb.; caustic soda, in drums, 3@3½c ℔ lb.; Cal. s. soda, bbls., $1.10@1.20 ℔ 100 lbs.; sks., 90c@$1.00; chlorate of potash, 12@13c; nitrate of potash, 6¾@7c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2½@2¾c; flour sulphur, French, 2¾@—c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 6½@7c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66° B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

OILS.—Linseed, boiled, bbl., 56c; cs., 61c; raw, bbl., 54c; cs., 59c; Lucol oil, boiled, bbl., 48c; cs., 53c; raw-bbl., 46c; cs., 51c. Kerosene—Pearl, per gal., 17c; Astral, 17c; Star, 17c; Extra Star, 20c; Eocene, 19c; Elaine, 26c; Water White, in bulk, 10½c; Mineral Seal, iron bbls., 18½c; wooden bbls., 21c; cs., 24½c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 15½c, do., cs., 22c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 12½c; do., in cs., 19c; Lard Oil, E. W. S., bbl., 65c; cs., 70c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 53c.; Natural White, 68c; Bleached, do., 57c; Whale Oil, cs., 57c.

COAL.—San Francisco, coast, yard prices to dealers: Wellington, $7.50; Seattle, $6.50; Coos Bay, $5.50; Cargo lot, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $14.00; Cannel, $8.50; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $11.50 per ton in bulk, $13.00 in sacks; Sunnyside, $8.50, long ton.

BISMUTH.—Subnitrate, ℔ lb., $2.10.

CHROMIUM.—90% and over, ℔ lb., 80c.

FIRE BRICK.—Domestic, carloads ℔ 1000, f. o. b., factory square, $25.00; soap and split, $22.50; arch and wedge, $27.50; skewback, $30.00; circle, $32.00.

FIRE CLAY.—Domestic, ℔ ton 2000 lbs. in 125-lb. bags double, and dry ground, f. o. b., factory, $8.50.

FUSE.—Triple tape, $4.00 per 1000 feet; double tape, $3.55; single tape, $3.10; Hemp, $2.85; Cement No. 2, $3.10; Cement No. 1, $2.75, in lots of 3000 and up.

LITHARGE.—Pure, in 25-lb. bags, 9½@10½c ℔ lb.

MAGNESIUM.—Pure, N. Y., $1.60.

MANGANESE.—Black oxide, ℔ lb., 2¾@4c.

MERCURY.—Bichloride, ℔ lb., 77c.

MOLYBDENUM.—98@99% N. Y., $1.75 ℔ lb.

PHOSPHORUS.—American, ℔ lb., 70c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitroglycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1**, 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2**, 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

RED LEAD.—500 lb. and over at one purchase, ℔ lb., 8¼c.; less than 500 lb., 8½c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 54c.

SODIUM.—Metal, ℔ lb., $1.

TUNGSTEN.—Best, ℔ lb., 90c.

URANIUM.—Oxide, ℔ lb., $3.40.

Commercial Paragraphs.

J. J. MENDEZ & CO. advise us that they are organized as representatives and agents for mining companies, with headquarters at Gante 8, Mexico, D. F.

BAVERSTOCK & STAPLES, assayers and metallurgists, have moved their Los Angeles office to larger and more commodious quarters at 223 West First street.

W. C. BOGUE, formerly manager of the Salt Lake City branch, has been appointed local manager of the Denver, Colo., branch of the Mine & Smelter Supply Co.

THE General Engineering Co. announces its incorporation, with temporary offices in the Dooly Block, Salt Lake City. They are prepared to do a general mining-machinery business.

THE De La Vergne Machine Co., of New York, claims the enviable record of having sold the largest gas-engine power plant, the largest ice plant and the largest oil-engine power plant in the world.

W. H. TRAVER has severed his connection with the Ingersoll-Rand Company, and accepted services with the Chicago Pneumatic Tool Company as manager of the mining and contract department.

RAPID-ECONOMY STAMP MILL CO., of San Francisco, report the installment of a number of their Richards' rapid-economy stamp-mills on the Salto de Agua Mining & Milling Co.'s property, about 100 miles southwest of Durango, Mexico.

THE Western Gas Engine Co. report installations as follows: 60-h. p. plant Anaheim Union Water Co.; nine engines for use at the government's reclamation works above Yuma, Arizona; 50-h. p. at Fayette, Idaho; two 60-h. p. at the Huntington Beach Co.'s. electric light and water plant; one for Monrovia water works.

Obituary.

NORTON A. WEBSTER, of Berkeley, Cal., was killed February 5 by asphyxiation in the Blue Bird mine, at Cripple Creek, Colo.

FORMER STATE SENATOR CHARLES NEWMAN died at Durango January 31 of pneumonia. He served in the State Senate from the counties of La Plata and Montezuma. He was actively engaged in mining and was one of the discoverers of the Yankee Girl mine.

Dividend.

February 2 the Bunker Hill & Sullivan Mining & Concentrating Co. declared dividend No. 100 of $180,000, payable on the 5th inst. This makes the total paid since January 1, 1905, $3,615,000, and total to date $5,886,000.

EDITORIAL.

OUR 'Prospector' department is evidently appreciated, and it will be our endeavor to make it useful. It is in charge of Mr. W. H. Storms, whose long association with this paper is well known. That the determination of rocks and minerals is accurate, is shown by a letter from a mining engineer in Mexico who sent 13 samples to us in January. He writes to say that he himself made a careful examination with the microscope and found the determinations published in the MINING AND SCIENTIFIC PRESS to be "absolutely correct, except in one instance, and in that there is some doubt."

SOME of the romance that flourishes in the absence of accurate knowledge has been dissipated by recent investigations into the origin of the celebrated ruins at Zimbabwe, in south-central Africa. It appears, according to Dr. McIver, who examined these architectural remains, that they are not as old as supposed and that instead of being the work of a highly civilized Semitic race of unknown derivation, they were constructed by a negroid people akin to the Kaffir, who carried on primitive mining and metallurgical operations until the Zulus scattered them and destroyed their community. Romance is fair, but knowledge is fairer; therefore we hope that the new explanation, reasonable in itself and in accord with the few facts in the case, will be confirmed in the course of further investigation.

DETERMINATION of value by formula may seem academic to most people who appraise mines, but when all is said, a formula is but the mathematical statement of logical thought. The note on this subject, from Mr. Newton B. Knox, is interesting because his formula has been used in a practical way by several experienced engineers. It pre-supposes a mine well developed and thoroughly sampled, with ore reserves large enough to ensure a life of several years. While methods of valuation based on personal experience are necessary to successful practice, there is no reason why the principles that underlie them should not find mathematical expression.

MINERALIZATION is a term which came by the back-stairs of etymology, but it has won its place in mining literature. The French *mineralisation* and *mineralisé* have a different significance from the words we use, for theirs signify 'ore-bearing,' *minerai* being the French for 'ore.' They have both *mineral* and *minerai;* we have 'mineral' and 'ore,' and we confuse them, making the first do the work of the latter. We have no means of distinguishing one kind of mineralization from another, except by adding other words of description. We mineralize a block of soft porous sandstone, if we wet it with water; for water is a mineral. If it is a block of sandstone which is iron-stained, it is mineralized by the iron in the strict sense of the word. But in the sense in which the miner, and those who have to do with mines in a practical way, understand the word, mineralization is the impregnation of the rock with ore, brought in from the outside. It is to be regretted that we have no distinctive words to express these radically different meanings.

The Amalgamated and Mr. Heinze.

The telegraphic despatches announcing the cessation of the bitter feud between the Amalgamated Copper Company and F. Augustus Heinze, through the purchase of the latter's interests by persons friendly to his opponents, is said to have given great satisfaction in Montana. It ought to; the fight between that Apache of finance, who has added to ancestral instincts for business the technical training of a Columbia School of Mines graduate, and a corporation directed by all the buccaneering skill of modern industrial rapacity, has been a standing disgrace to what we proudly call civilization, that is, the art of living decently in communities. The judiciary of a State has been debauched, its politics mired, its people obsessed, while two parties of mine-owners have twisted our awkward mining laws to the acquirement of territory and the destruction of property. Most unprejudiced observers will have taken the stand of Mercutio and called a plague on both parties to the controversy, because there was little to choose between them as regards the methods they used, for if Heinze was unscrupulous in pushing his demands, he met with similar tactics, the disreputable nature of which had already been established by Marcus Daly at an earlier date.

The cessation of a litigation involving something like a hundred lawsuits is a blessing to the mining industry. These cases have bred many personal quarrels, and, on the whole, they have been distinctly injurious to the good standing of the mining engineering profession, because they caused men to pose as scientific witnesses who were, to all intents and purposes, skilled advocates. The trial of cases involving complicated questions of geology before a jury selected largely for its lack of acquaintance with such matters, and the lecturing of such jurymen by technical men of high standing, who re-constructed creation in the interests of a mine-owner or a mining company, afforded a spectacle the scandal of which was relieved only by the humor of it. It is true that the exploratory work carried out as an aid to the preparation of testimony to be offered in the course of the litigation did lead to the discovery of many orebodies and furnished an increase of knowledge concerning the mining geology of the Butte district, but the price paid—from a professional point of view—was too great.

To the technical men in Montana this cessation of hostilities will afford keen pleasure; both parties to the quarrel have on their staffs some of the very best professional talent in America, and to these men the opportunity to go ahead with their useful labors, unhindered by a mixture of frontier barbarism and ward politics, will be a distinct gain. To them the tactics of their employers must often have been particularly distasteful, and to them the arts of mining and metallurgy will always appear best when free from alliance with predatory finance.

Distribution of Ore.

In this issue we publish the last of a series of four articles, by Mr. Walter P. Jenney, in which that experienced mining engineer has described and discussed the ore deposits of the Ontario lode, in Utah. The explanations offered are full of interest, because they may prove applicable to other regions. His cross-section of the Ontario lode should invite investigation, because the extent to which occurrence of ore is affected by change of wall-rock has long been one of the fundamental problems of mining geology. In this case rich ore, from three to eight feet wide, persisted from near surface to a thousand feet, at which horizon the lode became less productive, the impoverishment coinciding with a change of formation; for while both walls were quartzite down to 1,000 feet, the foot-wall became shale at that point. Coincident with this condition, the lode widened until it was as much as 250 feet, but the streaks of rich ore within this large width were so far apart that they became less profitable to mine. This condition began where the foot-wall was shale and became emphasized when the hanging also became shale, with limestone on the foot, that is, the lode follows a fault-fracture showing a dislocation of not less than 500 feet, which is approximately the thickness of the shale beds. It is a nice question whether the enrichment down to 1,000 feet was influenced directly by the nature of the quartzite, and, similarly, whether the impoverishment deeper down was due to any quality in the shale.

Is it not possible that the structural conditions explain the latter, and secondary action the former? Thus, it will have been noticed that the lode flattens in the shale beds, because it was easier for the fracture to travel along, rather than right across, the lamination; instead of a clean-cut fissure there was a big width of shattered rock which prepared the way for a large mass of scattered ore. In the quartzite, the fault-fracture cut almost at right angles across the bedding of that hard, close-grained rock and made a narrow fissure, which tended to restrict ore deposition within narrower limits. These conditions are often reproduced on a smaller scale, where a fair width, four or five feet, of medium grade ore gives place, either in strike or dip, to a narrow seam of rich stuff. Such cases are usually due to a change of structural conditions. Furthermore, we usually expect to see gold and silver lodes richest within a certain depth from their outcrop, because the leaching of the upper part—often eroded portion—of the vein yields solutions which in their descent tend to add to the original metal-content of the ore; in fact, Dr. Jenney recognizes this, for he mentions a zone of oxidation followed by one of secondary deposition. Why, then, impute the poverty of the vein

below this horizon to the effects of the wall rock?

The evidence for the influence of the enclosing rock upon the distribution of ore is much stronger in the case of the contact deposit which follows the stratum of soft gray limestone—25 to 35 feet thick—that occurs some distance above the quartzite. In this regard the vertical section of the Daly-West mine is particularly instructive. Ore is found along the Ontario-Daly fissure, and apparently it occurs with equal generosity where the hanging wall is 'Black lime,' 'Gray lime,' 'Upper quartzite,' 'Cherty limestone,' or 'Ontario quartzite,' throwing doubt on the agency of any particular formation in producing conditions especially favorable to its deposition. It must be pointed out, however, that the foot-wall is quartzite throughout this section, while the 'horses' inside the vein are torn from the hanging. But the selective action of the mineral solutions is clearly suggested by the 'contact' formation which follows the 'Gray lime,' producing a flat ore-measure which appears to have been fed by the various fractures that were produced by the faulting of the region. It appears true that the gray lime afforded a soluble stratum in which the ore was deposited by replacement, but even in this case we may properly inquire whether structural conditions were not as decisive as the chemical composition of the rock. This 'Gray lime' is a particularly fragile and brittle rock, says Dr. Jenney; these characteristics caused it to be so crushed and shattered as to influence the deposition of ore. So the physical conditions were important; why were they not decisive? This bed of gray limestone is overlaid by a 'black lime,' which is really a finely laminated carbonaceous shale; when the rocks underwent rupture this 'short'—as the miners call it—or brittle limestone was crushed, while the more pliable layers of black shale above it were simply distorted and bent. Subsequently any tendency for chemical interchange between the mineral solutions coming up the vertical fissures was rendered effective by the shattered condition of the gray lime, affording a permeable stratum and offering large surfaces for chemical attack, while overhead the shaly rock formed an impervious roof that prevented the upward distribution of the enriching waters. The influence of such barriers is at least as important in the distribution of ore as the chemical composition of the wall-rock.

Australian Development.

The Hon. Daniel O'Connor of Australia—as the local press describes him—has arrived from the Antipodes on a lecturing tour. His enthusiastic descriptions of the continent under the Southern Cross make even a Californian feel that his manner of describing his own State is modest indeed. Most countries can be viewed from at least two points of view, otherwise the congestion of population in some of them would soon become unbearable, and Mr. O'Connor regards his own habitat through the glowing imagination of a cultured Irishman; nevertheless his description of the mining potentialities of Australia must not be permitted to attract too many of our citizens to the other side of the world. He says "We need you Americans and your scientific methods. Strange as it may seem, mining is still conducted on comparatively primitive lines compared with the American advanced system." And yet not so altogether primitive. The Mt. Morgan gold mine has produced $56,891,000 and is still yielding $2,800,000 per annum; the Broken Hill Proprietary has produced $132,816,003, and paid $38,722,400 in dividends, and is still adding $8,000,000 annually to the metallic wealth of the world; at Kalgoorlie, in Western Australia, there is a golden square mile of mining territory that contributes about $22,000,000 per annum; and in Tasmania the Mt. Bischoff tin mine has paid $10,040,000 in dividends. We can afford also to differ from Mr. O'Connor when he emphasizes the present crudity of method in Australia as indicative of the possibilities within the reach of scientific engineers, because of late years American experience and energy has been abundantly applied to Australasian mining—at least at Broken Hill and in Western Australia. The fact is, there is plenty of undeveloped wealth in North America and in that part of it included within the limits of the United States. Our friends will do well to remember the proverb that says "the oxen furthest from home have the biggest horns."

The Survey and the Technical Press.

The unrestrained journalistic activities of the members of that branch of the Government service known as the United States Geological Survey have been placed under restraint by a recent order promulgated by the Director, Mr. Charles D. Walcott. The exact amount of literary freedom permitted to the officials of the Survey, in connection with technical publications, is prescribed in a letter which we publish on another page. It is well that the matter should be generally understood, for such public understanding will prevent the recurrence of another scandal similar to that which occurred last year. Of the attempt made by one or two of the officers of the Survey to control a Chicago mining periodical and the effort of the publishers to subvention the members of that Government department, the best that can be said, and all that need be said, is that it was a miserable failure. And this was fortunate for all concerned, except a few subordinates whose small salaries became involved in the fiasco. In that affair, the Director's name was freely used, and other proceedings took place of such a character as to have involved the Survey seriously, had not the protest of a geologist, once a member of the Survey, precipitated a vigorous newspaper criticism, followed by an enquiry which put a stop to further alarums and incursions. That episode is now buried and, let us hope, will soon be forgotten.

With the Director's recent instructions, there is but little fault to be found; in the main they are reasonable and judicious. Within certain limits it is obviously to the public interest that the observations and ideas of the government geologists should gain the widest publicity possible, for their ideas and observations are of immediate value to the mining industry for the benefit of which the scientific corps to which they belong was primarily organized. At the same time, official reports should not be anticipated and serious differences of opinion—especially as to facts—ought not to be ventilated *coram populo*, for such action is prejudicial to the usefulness of the organization to which the geologists belong.

Speaking from the standpoint of those engaged in technical journalism, we agree that there is question as to the propriety of government geologists being identified—as editors or directors or shareholders—with any technical or trade paper. The plan of having such gentlemen as 'special contributors' to a reputable journal answered well enough until it was prostituted to purely commercial ends. In order to prevent complication, arising out of any attempt to make close distinctions, the Director has put his veto on this pleasant courtesy also; and he is undoubtedly wise.

Finally, he defines this prohibition as applying only to "technical and trade papers conducted as business enterprises" and excepts those journals which are "devoted entirely to the dissemination of scientific knowledge and which are not conducted for profit or as business enterprises." Well, here are distinctions which each man can make for himself. They remind us of the old English idea that an honorable business was inferior to a scientific pursuit. If *Science* and *Economic Geology* are not conducted as business enterprises they will be short lived; which would be a pity. Because a paper is frankly a business enterprise conducted with an honorable purpose, in which the idea of being useful is at least as prominent as the notion of gain, it is not necessarily less worthy of the support of good citizens than a scientific journal which serves as the spokesman of a group of talented men. Between a trade paper frankly using its reading matter as a lure for advertisements and a class journal supported wholly by subscriptions, there is room for many kinds of journalistic enterprise, but we do not accept any hard and fast classification such as that of Mr. Walcott. The papers he mentions—and may they prosper—accept advertising matter, and if the amount of this be small, it is not necessarily due to self-denial; this fact, we hold, places them alongside the technical paper which is mainly supported by such sources of income. The definitions obtaining in sport hold good: a paper which accepts pay for anything that it publishes, inside or outside, is a professional or trade paper; the journal that receives money only from subscriptions is an amateur or scientific periodical.

By the Way.

Mr. O. P. Austen, Chief of the Bureau of Statistics, has made certain interesting comparisons between the trade and transport of the Orient. He said:

The population of Asia and Oceania is 850 millions, while that of all other parts of the world combined is but about 750 millions. Its land area is 18 million square miles, and that of all other parts of the world 34 millions; yet its commerce is slightly less than three billions of dollars, and that of other parts of the world 19 billions. This gives an average commerce in the entire Orient of about $3 per capita per annum, while the average in all the rest of the world combined is $27 per capita. Thus the Orient, which has more than one-half of the world's population and more than one-third of its land area, has now but one-ninth the average per capita in all other parts of the world. That region which we term the Orient, while it has more than one-half of the population and one-third of the land area of the world, has but about one-tenth of the world's railways and less than one-tenth of its telegraph lines. The people of the Orient are, as a rule, industrious, painstaking, and now disposed to commercial intercourse with the Occident, but without facilities for transporting their products from the interior to the seaboard, where they may sell or exchange them for products of the other parts of the world, they are powerless to develop commerce.

China, India and Japan have about nine-tenths of the population of what is generally known as the Orient, and the relative development of commerce to railways is most suggestive. Railway construction in India began about 1853, but did not make rapid development until more recent years. In Japan railway building began about 1872, but most of the development has occurred during the past decade. In China nearly all of the railway now existing has been constructed since 1900, and under circumstances which have not permitted its development as a system which would have material effect upon commerce. We may, then, fairly compare the growth of commerce in these three great Oriental countries, two of them with young but rapidly developing railway systems, the other with practically none.

The foreign commerce of China, with its 400,000,000 industrious people, but no railways, has grown but $160,000,000 since 1870; that of India, with 300,000,000 people and a system of railways, has grown $258,000,000, and that of Japan, with only 45,000,000 and a system of railways, has grown $215,000,000. The Chinaman is known by those familiar with the conditions in the Orient as a natural trader and business man. A large share of trade in the Orient is in Chinese hands, and the positions of trust in the great banking establishments are largely held by Chinamen; yet, despite these commercial characteristics of the Chinamen, the foreign commerce of China, with no railway system, is but 85c. per capita; that of India, with 28,000 miles of railway, is about $2.25 per capita, and that of Japan, with 4 500 miles of railways, is $5.86 per capita. In other words, the commerce of China, without a system of railways, is about one-third as much per capita as that of India, and one-sixth as much per capita as that of Japan, each of which has but one mile of railway for each 10,000 inhabitants.

But there is another feature of this recent railway development in the East which must be considered as likely to prove of great importance in the future relations of the Orient with the Occident. China has 2,000 miles of railway, most of it connected with the great Trans-Siberian line, and several thousand miles more have been authorized or definitely proposed. French Indo-China, lying just at the south of China, has over 1,000 miles constructed and many new lines projected, while the Malayan peninsula, still farther to the south, has some 300 miles, Siam about 350 miles, and Burmah 1,500 miles. The French Indo-China system is to be connected with the railways of China by a line 230 miles long, now under construction, at a prospective cost of some $20,000,000. The railway lines under construction or projected in China promise to extend to her southwest border, where a few hundred miles of railway would connect them with the systems of Burmah, which in turn will connect with that of India, about 28,000 miles in length.

From India the railway system again stretches westward into Persia, and the construction of but a few hundred miles would put this great system into communication with the 2,000 miles of road in Asiatic Turkey, which in turn connects with the railways of southern Europe, while a comparatively short stretch of road at the north of India would also connect the Indian railway system with that of Russia. While it is a fact that serious political obstacles to some of these unions of railway systems now exist, it is not unlikely that the demand of commerce will in time be sufficiently strong to overcome or sufficiently modify these political conditions and to render possible a union of these numerous systems, great and small, so far as relates to an interchange of passengers, freights, mails, and the establishment of other transportation systems between the railroads of Europe and those of Asia.

Concentrates.

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and to give information dealing with the practice of mining, milling and smelting.

COPPER is softened by heat and loses tensile strength thereby.

ELATERITE is one of the hydro-carbon minerals, a species of elastic bitumen.

KAOLIN results from the decomposition of feldspars and other aluminous rocks.

NO MINING CLAIMS may be located on Indian reservations, though claims may be taken on forest reserves.

IN measuring the cross-section of a stream, measurements should be made at 10 or 12 places and a mean of the depths taken.

COMPRESSED-AIR VEHICLES for metropolitan use have been almost wholly succeeded by the modern motor car or automobile.

SEVERAL 'compounds' are manufactured for the removal and prevention of boiler scale. Different waters require different remedies.

FLUORITE (fluor spar) is calcium-fluoride. It has various commercial uses. In a few instances it is employed as an ingredient of portland cement.

A PECULIAR occurrence of lead-zinc sulphide has been observed in Moniteau county, Missouri, where galena and zinc blende occur in small fissures cutting beds of coal.

GRANITITE is the name given to a granitic rock which contains soda-lime feldspar as well as orthoclase feldspar. The latter in such rocks is usually pink, and the mica occurs sparingly.

THE greatest square that may be described within a given circle may be ascertained by multiplying the radius by 1.4142, or the diameter by 0.7071. This gives one side of the square.

MECHANICALLY rabbled furnaces have a greater capacity than those that are hand rabbled. If the roast is incomplete it is probable the rabbles travel too fast, or the furnace is too short.

IN concentration, the greatest care should be observed to crush ores only as fine as necessary to free the metallic particles or sulphides from the gangue. When sliming takes place troubles multiply.

THE exhaust of a gasoline or gas engine may be deadened by connecting it with a box or cylinder somewhat larger than the exhaust pipe, and in which are several diaphragms of ⅛-in. wire cloth.

THE chief difference between a dynamo and an electric motor is, the former converts mechanical energy into electrical energy, the latter transforms the electrical energy back into mechanical energy.

BY foot-pound is meant the equivalent of lifting one pound a height of one foot in one minute. Thus a stamp weighing 1,000 lb. dropped six inches 100 times in one minute develops 50,000 foot pounds.

THERE are usually one of three causes for the foaming of steam boilers—the presence of sodium salts in the water, or of mud or other suspended matter, or else organic matter of some kind may be present.

A JUNIOR CROSS-LODE locator may follow his lode through the ground of the original senior location and through the senior vein, but he must turn all ore taken from the intersection over to the senior locator.

WHERE hydraulic sizing boxes cannot be placed between the stamp battery and the concentrators, the pulp should be sized after passing the vanners, and the overflow sent over inclined canvas tables to concentrate the slimes.

IT is usually figured that the highest safe velocity for water in a wooden flume is from seven to eight feet per second. The California practice is to lay flumes on a grade of about ¼ inch per rod, and sometimes two inches per 100 feet.

WHERE several parallel, or nearly parallel veins occur within a quartz mining location the owner of these—if all apex within the boundaries of his claim—has the same extralateral rights on each as upon the original discovery vein.

WHEN mill amalgamating plates have become hard and non-absorbent, they may be annealed and softened by heating. Care must be taken that the heat be uniformly applied or the plate will 'buckle' and present an uneven surface.

GALVANIZED WIRE ropes cannot be safely employed for hoisting or running ropes. The constant bending over sheaves or drums causes the zinc to scale off, leaving the rope in bad condition. Such ropes may be used for guys and similar purposes.

NO person may enter upon a patented placer or other mining claim to locate water, no matter how long the water may have been unused. If the water flows across the claim, a water right may be taken either above or below it, but not on the claim.

A PRESSURE OF WATER of one pound per square in.h is equal to 2.304 ft. head. A pressure at the gauge of 200 lb. indicates a static head of 460.8 ft. To find the pressure of water per square inch at any given depth, multiply the head in feet by 0.434.

URANIUM OXIDE was discovered in 1884 near Crown hill, about five miles southwest of Lead, in South Dakota. Previous to this, uranium mica was discovered in the Ross-Hannibal mine, in Ruby Basin. This mine produced a high-grade gold-silver ore.

NARROW mortars have a tendency to scour the inside plates of a mill. This may be prevented by covering the place with a heavy wire screen of ½-in. mesh. In a few mills plates of iron cast in the form of a grating have been used to prevent scouring, with good effect.

A STEEL CABLE of 1½ in. diameter, traveling at a speed of 1,056 ft. per minute, will transmit about 2,000 h.p. In comparison with this, an electric current of 10,000 volts at 1,000 amperes, delivered through a copper wire of one square inch section, will deliver about 13,000 horsepower.

ONE TEST for the presence of tellurium in ore is by means of sulphuric acid, which produces a violet color. Pulverize a small quantity of the mineral, place in a white dish and moisten with a few drops of sulphuric acid. If tellurium in any form be present, the violet color will be seen.

THE effect of the presence of small quantities of aluminum in iron and steel was recognized more than 50 years ago. The aluminum renders the steel tough. It is said iron made from ores occurring in aluminous rocks is stronger than ores occurring with other rocks—jaspers, sandstone, limestone, etc.

OIL WELLS flow under conditions which may make an artesian flow of water impossible. Most successful oil wells are located at or near the crest of an anticlinal fold. Water only rises to the surface when the source of supply is higher than the mouth of the well. It may be near or many miles distant.

CAPE NOME, ALASKA, is about 150 miles from the Arctic Circle. Since its discovery, the gold hunters have pushed northward until now some mining is done within the Arctic Circle. The gold discoveries on Selawik river and north of that stream are well within the Arctic Circle and about 1,600 miles from the north pole.

THE laws of California or of the United States do not inhibit mining by ground-sluice method, but tailings, resulting from hydraulic operations, and impounde behind dams built for that purpose, cannot be groundsluiced, as such act would be directly contrary to the purpose of the law placing restrictions on hydraulic mining.

TIN has not been so high as at the present time in many years. The price should prove a great stimulus to prospect for tin, but few authentic discoveries in the United States are announced. Among the places where tin is known to exist in this country are: South Carolina, Maine, Missouri, South Dakota, Idaho and southern California.

UNDOUBTEDLY there is a loss of gold by absorption as well as by volatilization in cupelling, but where the work is carefully done this loss is so small as to be negligible in calculations of value. Doubtless a gold lead can be cupelled and re-cupelled until nothing is left of it. Some careful assayers have placed this loss at from one to three parts in one thousand.

GALENA AND SPHALERITE have very different densities—7.586 to 4.046—still these two sulphides are most difficult of separation by ordinary wet concentration devices. The magnetic separator has accomplished a great deal in this direction and has made possible the production of two marketable products from low-grade, complex ores, which were previously worthless.

GOLD occurred in large amount in ankerite at one place in the Rawhide mine in Tuolumne county, Cal. It was the only place known on the Mother Lode where ankerite was rich in gold. The metal usually is found on this lode in quartz or in the silicified amphibolite schist. Gold is also often found associated with quartz and pyrite in the ankerite, but the ore is usually low grade.

METACINNABARITE is essentially the same as cinnabar, differing only in crystallization and color, which is blackish brown, resembling iron ore. It is found in a number of California cinnabar mines. The appearance of native mercury in mines is not looked upon as favorable to deeper mining, as the metal is so often found near the bottom of an ore-shoot. It is supposed to be the result of distillation of the sulphide from natural causes.

WHEN the owner of an unpatented mining claim has performed $500 worth of work on the location, he may at any time thereafter make application for a patent. The required $500 worth of work or improvements may be made as soon after location as the owner may please—within a week if desired—but annual assessment must be kept up until application has been made for patent, the money paid into the Receiver's office and receipt issued therefor.

WHERE large square timbers are not available for headframes, or for other constructive purposes, timbers may be built up by spiking boards or plank together. Such a built-up timber is no stronger than one of solid timber, provided the latter be sound, but will be found to answer every purpose. If the built-up timber is to be framed before putting in place, care must be taken that no nails or spikes are driven where mortises are to be cut or other framing work done.

WHERE oil is used as fuel in reverberatory furnaces, the steam employed in the blast should be generated by utilization of the waste heat from the furnace. It seems unnecessary to fire up a separate boiler for this purpose except to get the fires started in the furnace. To light the oil from the burner a safe way is to set fire to a handful of oil-saturated waste and hold it under the burner until the latter becomes thoroughly heated, sufficiently to vaporize the oil fed through it.

THERE are no extra-lateral rights in the Leadville, Colo., district, owing to the fact that no jury ever impaneled in the many mining suits in the courts there ever admitted that the deposits had an apex. Were the law literally interpreted in that district, a few outcrop companies could control large areas, their right to follow the orebody being terminated by one of the several faults. Some of the orebodies do not come within several hundred feet of the surface at any place.

GALENA is nearly twice as heavy as pyrite. The former requires 4.34 cu. ft. to make one ton, and the latter 6.41 cu. ft. Vein quartz in place is generally figured at 13 ft. per ton, but it is often somewhat more. Where considerable dark bi-silicate mineral is present, such as hornblende or biotite mica, the specific gravity is higher and as little as 11 ft. is required to make a ton. The mass required to weigh one ton also depends upon the quantity of sulphide minerals present.

ONE of the noted fly-wheels of the world is that at the works of the Mauesman Company in Germany. This wheel consists of a cast-iron hub, to which is attached two circular steel plates. About 70 tons of No. 5 steel wire were used in wrapping the hub of this wheel, the wire filling the space between the two steel plates. This wheel is run at 240 r. p. m., or a peripheral speed of over 15,000 ft. per minute—about 10,000 ft. faster than it would be safe to run a cast-iron wheel of the same diameter.

REDWOOD is a good mine timber where too great weight is not placed upon it. It is more durable than any of the pine timbers used in mines, but can resist much less crushing force, and is very brittle. On the Pacific coast the so-called Oregon pine is superior to most other woods for mining purposes. The life of mine timbers depends largely upon the conditions under which it is placed. Comparatively poor timber will last longer under favorable conditions than the best timber, where set in a moist atmosphere laden with noxious gases.

A TABLE prepared for the use of hydraulic miners and others using water for power or other purposes gives the following data: A rectangular flume, three feet wide, running 18 in. deep, will have velocities and capacities as follows: Grade, ⅛ in. to 1 rod; velocity, 2.6 ft. per second; quantity of water per minute, 702 cu. ft. Grade, ¼ in. per rod; velocity, 3.7 ft. per second; capacity, 999 cu. ft. per minute. Grade, ½ in. per rod; velocity, 5.3 ft. per second; capacity, 1,431 cu. ft. per minute. Ditches and flumes should not be run more than three-fourths to seven-eighths full.

NARROW-GAUGE railroads for the purpose of affording greater convenience and economy in mining operations are always commendable and usually successful from a business standpoint. In one instance a narrow-gauge road was built six miles in length at a cost of about $4,000 per mile. It hauled about 400 tons of ore daily from the mine to the mill, at a cost of 12c. per ton (as against wagon haul of $1.50), and all the supplies, timber, etc., were hauled from the mill to the mine. The mill was situated near a main line of railroad. The difference in elevation was about 600 ft. The plant was situated on the desert and water had to be pumped for milling. It might have been as economical to pump the water to the mine, dispensing with the railroad, as it had to be pumped anyhow, but had this been done, then all the fuel for steam making, timber for mine use, and supplies of all kinds must have been freighted by wagon to the mine, which would have added greatly to the expense of operations. The railroad paid for itself many times over before the mines were closed down.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy.

A USEFUL FORMULA.

The Editor:

Sir—The following formula may prove useful to some of your readers; I have found it so in professional practice:

Development of formula to determine capitalization or true worth of mine having a given yearly net profit; the mine to pay a certain amount each year on capital invested and to pay back in addition, at end of its life, the whole of the capital invested; the sinking fund to be invested at a certain rate during the life of the mine:

Let x = Capitalization.
a = Amount of an annuity of $1 in any number of years. See tables.
y = Yearly sinking fund. Then:
x ÷ a = y, or x = ay. (1)
Let d = Total yearly profits.
z = Amount to be used as dividends. Then:
d — y = z, or y = d — z. (2)
Let c = Rate of interest required on capital invested. Then:
xc = z. (3)

Substituting formula (1), y = d—z in (3),
we have x = a (d—z) = ad—az;
substituting z = xc, we have x = ad—axc, whence
x = ad ÷ ac + 1.

Hence the above formula gives the present value (x) of a mine paying a total yearly profit of d, money to be returned in n years, sinking fund to be invested at m%, and allowing an additional c% as dividends.

Example:

Let the mine pay a yearly profit of $1,800,000 = d.

Let the sinking fund be invested at 5% and the life of the mine be 10 years.

Then from the table it is seen that a = 12.57.

In addition to the sinking fund the mine is to pay 10% on the capital invested; c = 10%.

Then: $$x = a\,d \div ac + 1 = \frac{12.57 \times 1{,}800{,}000}{(12.57 \times 10\%) + 1}$$

Whence x = $10,002,000.

So if the mine be capitalized at $10,024,800, it must pay 10% on investment as dividends, or $1,002,480, leaving the difference between total profit ($1,800,000) and dividends ($1,000,240), available for a sinking fund, namely $799,760. This sinking fund if invested for 10 years at 5% will amount to $10,052,983, or the amount of the original investment.

ANNUITY TABLE FROM KEMPE'S HANDBOOK.

ORE DEPOSITION AND DEEP MINING.

The Editor:

Sir—I have read with very much interest Mr. Lindgren's article on this subject in your imprint of January 20, and since my arrival in California have also read with great pleasure and profit, Mr. Lindgren's official reports in the publication of the United States Geological Survey, also his valuable contributions to the American Institute of Mining Engineers. Unfortunately, I missed meeting him during his visit to Australia when he was looking into the Victorian 'deep leads' of the Moolort Valley as at that time I was making a geological survey of some tin mining areas in northern Queensland. However, we may meet later on this side. In the meantime I would be glad to know from Mr. Lindgren, who the Australian geologists are, whose estimates of the amount of rock removed by erosion he considers too large, and what are the data upon which he bases his estimate of the lesser amount; and if he has been able to fix the period when the gold was formed in the Bendigo saddle reefs, or those of the adjacent auriferous matrices. Having had charge of the underground surveys in this important field, after Mr. E. J. Dunn, the present Director of the Geological Survey had obtained the material for his lucid monograph on Bendigo, I am naturally interested in the question raised by Mr. Lindgren's remark. Again, referring to the Ballarat field, it is stated that "they have scarcely attained a depth of 2,000 ft." At the time I left Australia in May last year several of the mines were down to a depth of 2,300 ft. Regarding the future of deep mining in California, so far as I can judge from the geological conditions at several of the areas, I have visited such as the Johnnie mines in Nevada, the Bighorn in the Sierra Madre, and the Mother Lode, near Placerville, there is every possibility of ore deposition to as great a depth as mining operations can reach, and I can, therefore, heartily support Mr. Lindgren when he says that "the latest results in the State of California and also Nevada offer much encouragement to those who believe in deep mining," in the United States as well as in Australia.

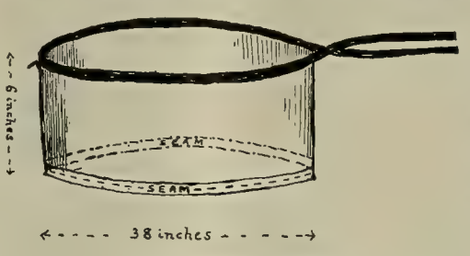
MINE SAMPLING.

The Editor:

Sir—Contributors to *The Engineering and Mining Journal* have described several devices to catch samples as they are broken from the vein. While these devices possess merit, there are obvious limitations to their usefulness. The flexible Mexican hat used



Device for Catching Sample.

by some in sampling, suggested another form which our firm has used, under widely varying conditions, with much success. The apparatus consists of a closely woven, shallow, canvas bucket, with a frame and handle of insulated copper wire. Dimensions are given in accompanying sketch. The wire must admit of the frame and handle being moulded to any desired form in the hands and yet retain its shape during use. No. 2 B. & S. gauge triple-tape, rubber-insulated copper wire would seem to be the most suitable, but, on account of the insulation and temper varying, it is important to test the stiffness of the wire.

Seams can be made nearly as tight as the meshes of the canvas, if sewn with fine linen thread. As such a device can properly be used merely to catch the sample, it is purposely made shallow and should be emptied frequently. This is essential in sampling a friable deposit where material not wanted in the sampling may be broken and must surely be rejected or the results vitiated.

A simple brushing suffices to clean the bucket preparatory to taking a new sample with ore of low or medium grade. In case of friable high-grade ore, additional precautions may be necessary, or possibly a change in the materials used.

When sampling high quartzite stopes in the Black Hills, the handle was lengthened by wiring on a piece of wood. Double-hand work was necessary there, and this enabled the engineer to follow the point of the gad without difficulty.

In sampling a friable irregular vein in Arizona, the device proved invaluable in tight corners. Under all circumstances it is much superior to the classic caudle-box, so often used by the engineer in the past. The canvas bucket is light and takes up but little room. A number can be thrown into the sample-bag when starting on a trip, to be at hand when needed.

Progress is reported in the methods of breaking samples. Mr. H. C. Hoover tells me of a special air-drill which is used by his samplers in Western Australia. For mines using air-hammer rock-drills a few lengths of hose go far to render more complete the triumph of brains over brawn.

HOWARD D. SMITH.

San Francisco, January 30, 1906.

SCREENS.

The Editor:

Sir—My attention has been called to a paragraph under 'Concentrates' in your issue of January 27, in which it is stated that "wire-cloth screens present a greater aggregate discharge aperture than perforated or slotted metal screens of equal opening." This statement should be qualified. To possess durability approaching that of the best perforated steel, wire-cloth must be woven of heavy-grade steel wire, as only this is suited for mining purposes; up to 30 or 35-mesh, slotted screens are made giving areas of actual opening as great as wire-cloth, and in one case where a comparative test was made the close-spaced slotted screen lasted 26 days where the wire-cloth lasted 12 days, under similar conditions in the same mill and treating the same ore.

Finer than the 35-mesh the wire-cloth has greater close-spacing per square inch than is commonly punched in steel, but even in these cases the steel is so much more durable that, where it furnishes adequate capacity, it is preferred.

Another point developed by testing screens—and which may interest millmen—is that of two slotted screens, one with bridge or solid metal between the slots half the width of the other (giving greater capacity), the life will be about the same. The practical reason is that the steel is worn by the particles that strike the solid, not by those that go through the holes, and the screen is only discarded when the mesh or width of hole is worn to exceed a certain limit. This happens just as soon with the wide-spaced as with the close-spaced slots.

There are many other points developed in the screening of materials, some favorable to wire, some favorable to perforations, and whichever is used there is some art in selecting the opening to give the product desired, but as I ought not to tax your space with a book about it I will stop here.

Oak Park, Illinois, January 31, 1906.

SECTIONAL DREDGING MACHINERY.

The Editor:

SIR—As regards sectionalizing placer dredging machinery for use in remote regions: it is obvious that the boilers, engines and such parts as have been sectionalized for other purposes may be readily obtained in shape for mule-back transportation. There are, however, various portions of the machine which it seems at present could not be sectionalized satisfactorily to the required weight or size of piece which may be transported in this manner.

The standard type of dredge used in California uses a bucket having a capacity of 5 cu. ft.; it has a cast-steel back weighing from 850 to 1,000 lb. Bucket-backs of lighter weight have been discarded in favor of the heavier, on account of the increased wear obtainable. It is true that a built-up bucket either of the continuous or open-link type can be built of small pieces riveted together, but actual practice demonstrates that the solid cast-steel back is preferable in every respect. It is true we are using in California some dredges with 3-cu. ft. buckets, those of the open-link type with built-up buckets having an actual capacity of from 600 to 750 cu. yd. per day, while the continuous-bucket type with cast-steel bucket-back will average from 1,000 to 1,500 cu. yd. per day, in the average digging, without trouble. The upper tumbler for driving the bucket-chain it would be practically impossible to sectionalize; in fact, the latest practice in this respect calls for a six-sided tumbler, in place of the old five-sided, not because six sides are better for driving or for the dumping of the bucket, the fact being to the contrary, but because practice has established a size of shaft which it is practically impossible to pass through the old type of five-sided tumbler. The shafts are getting heavier annually. From my personal experience, dating back to 1893, I can say, that at that time we considered a 6½ to 7-in. shaft as ample for driving a 5-cu. ft. bucket-chain into the tightest of soil. Recent construction calls for hollow-forged and oil-tempered nickel-steel shafts, the very finest that can be produced, of a diameter ranging from 11½ to 14 in.; and as these shafts are from 8 to 10 ft. long, according to the type of drive used, the piece is necessarily very heavy, and there seems to be no possible way to reduce its weight for packing over a mountain trail. In fact, one five-foot dredge, to my knowledge, was fitted with a hollow-steel shaft 18½ in. diam., and approximately 11 ft. long, which it would have been impossible to have made in more than one piece. Other various portions of the dredge could probably be sectionalized to quite an extent, and in the case of remote operations a dredge could undoubtedly be built which would handle a reasonable quantity of gravel and not have any parts too heavy for mule-back transportation. A dredge which closely approximates the necessary conditions for this purpose was built by Mr. Ogilvie, of Dawson, from designs of A. Wells Robinson, of Montreal, and was put in operation on the Stewart river. Buckets were of 2¼ cu. ft. on alternate links of the chain, and the dredge was intended for excavation not to exceed 15 ft. below water-line. The dredge has been successfully used in prospecting various portions of the Stewart river, and now lies on the Yukon a short distance below Dawson. It will probably be used next season for prospecting other parts. The fact still remains, however, that if one has sufficient acreage of placer ground which is suitable for dredging purposes, and which is remote from the common carriers, if the ground is sufficiently rich to warrant his dredging it for a profit, the cost of constructing a road which would permit his machinery to be hauled to the ground in the usual form would be so small in proportion to the profits on the operation that distance from transportation need not deter anyone from entering into the dredge business. I have certain knowledge of machines of the usual type

which have been hauled over mountain trails 70 to 150 miles from a railroad station, and in cases where the owner was obliged to make the road or trail over which the machinery was hauled, and in one case even to send to the Eastern States for wagons, harness, etc., and to Kansas for mules, in order to get his machinery on the ground, and the dredge has repaid its entire cost of installation, and all expenses connected with purchasing the ground, prospecting it and maintaining it, and a profit besides of over 150% on the total capitalization of the venture, although it has only been in operation three years. The prospecting shows an average value of 16c. per cubic yard. This dredge is driven by steam and burns the poorest quality of spruce wood for fuel at a cost of nearly $4 per cord at the dredge, and the dredge consumes 15 cords per day.

G. L. HOLMES.

San Francisco, February 8, 1906.

ELECTRICITY VS. COMPRESSED AIR FOR MINE OPERATION.

The Editor:

Sir—The recent discussion in these columns regarding the relative merits of compressed air and electricity as a method of power transmission in mining work has, I believe, created considerable comment, and in particular the letter of Mr. Edward F. Schaefer in your issue of January 20. In justice to those of us who are vitally interested in the introduction of electrical machinery into this field, as well as to call attention to some inaccuracies in Mr. Schaefer's letter, which unfortunately give the impression that the writer is perhaps not as familiar with modern electrical machinery as he is with compressed air, I beg the privilege of your attention.

In Mr. Schaefer's fifth paragraph he estimates all losses "beginning with a steam engine," thus entirely ignoring one of the chief benefits to be derived from the use of electricity, namely, the utilization of any available water-power within a radius of ten to twenty miles for small plants, and within greater limits in proportion to the size of installation. Further, it is by no means necessary to use step-up transformers at the generating end of a transmission line, as dynamos are now commercially built to generate at voltages as high as 11,000, which is a good deal higher than that necessary to transmit power in moderate quantities over considerable distances; moreover, recent quotations on electrical machinery, both motors and generators, show a decided difference in favor of the alternating current.

I am willing to admit that, generating from steam, compressed air may be produced at a lower installation cost per unit than electricity, but this advantage I believe to be far more than offset by the gains made possible by the extreme flexibility of the electric system. Compressed air is practically essential in modern mining operations for one reason only, namely, the operation of rock-drills, in which field it still predominates and probably will for some time to come, although there are many designers now working on the problem of the electric drill, some of whom have produced fairly practical machines—and, to my mind, it is only a question of time until the air-machine is superseded in this work, as it has been in practically all others. In the coal mines of the Eastern part of the country electric power now does everything excepting this one operation; having gradually pushed out the compressed-air coal-cutting machines, hoists and locomotives, and in this State it will be found that it is used more or less in every new undertaking of any magnitude.

Another point, which Mr. Schaefer has ignored, is the extreme ease and efficiency with which electric pumps and hoists may be installed. This point is of extreme importance in the operation of winzes, often situated at a considerable distance from the power-house, where the use of air or steam would be impracticable, if not impossible. The ventilation advantage is about evenly balanced, though I have known cases of bad air in stopes where hand-work only was being done, having been quickly relieved by the installation of a small electric blower, which would be obviously impracticable with any other power.

So far as danger is concerned where bare conductors—such as trolley wires—are used, I would say that, for reasons of insulation, a voltage higher than 250 is seldom used, a shock from which, while unpleasant, is by no means dangerous under ordinary circumstances. The most ignorant workman, after one experience, learns to leave it alone, and I have never heard of a serious accident chargeable to this cause.

Momentary interruption to the service is liable to occur, but the complete modern electrical installation is usually provided with duplicate parts to such an extent that service may be continued, wholly or in part, with very slight loss of time, while the bursting of an air-line or the breakdown of a compressor invariably means quite a long shut-down.

Regarding the lighting question, there is a decided difference of opinion, but it is undoubtedly a fact that whether lights are used or not at the working faces, lights at the shaft or in the tunnel are of the greatest advantage, both for considerations of safety and convenience. I take serious exception to Mr. Schaefer's statement that the "old form of miner's lamp has the advantage." I have never yet seen or heard of any kind of a lamp with which "explosions were impossible," and I believe that the electric light comes nearer this point of perfection than any other now in use.

The marvellous extension of the use of electricity in other fields will have its parallel in the mining world, and I await only the perfection, in the near future, of the electric rock-drill to see it become the one power used, or thought of, wherever mining work is done.

HAROLD B. BARNES.

Leadville, February 6, 1906.

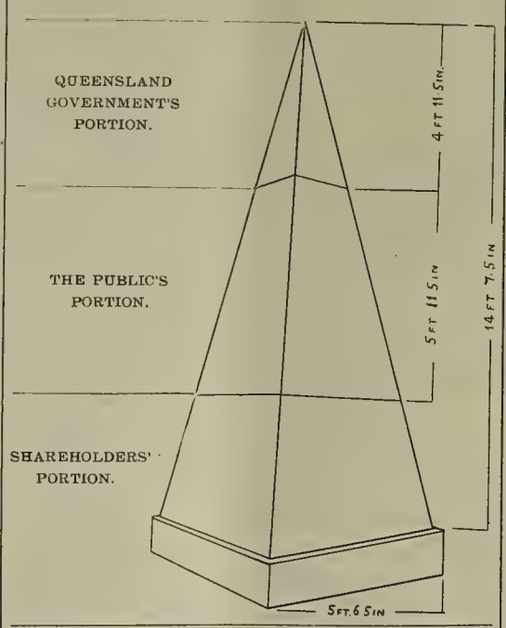
FINE GRINDING.

The Editor:

Sir—As one whose experience in ore grinding began 36 years ago and who subsequently has been almost uninterruptedly associated with it, I am pleased that interest seems to be taken in the public discussion of the subject. It is to be hoped that a generous spirit will prevail and no bitterness engendered.

With some ores, values are pretty well released without very fine comminution, but I believe that we of the United States have generally erred in not making our pulp fine enough. Our *patio* neighbors to the south of us have always in the past excelled our work in that respect. They have been content with their slow-going *arrastres* and unmodernized Chilean mills, in which the coarser particles settle to the effective-crushing zone while the finer particles float above.

We early evolved the pan, with a faster motion, to grind as well as to amalgamate, but in this there is



Pyramid Representing Gold Produced by Mt. Morgan Mine.

no systematic selection of the particles most needed to pass the grinding surfaces. The pan served the purpose when we knew no better, and strange to say it still, by some, seems to be considered an economical grinder. More than 20 years ago I departed from this practice by introducing special grinding pans in which the pulp passed once under a muller having a solid ring disc and thence out of the pan to another of the same kind, if finer pulp was desired. These were decidedly better and more economical than the amalgamating pan, used as a grinder; yet they were not as efficient and desirable as a grinder adopted some 16 years ago which was of the old buhr-stone flour-mill type, made entirely of metal, and run at a high speed. Where the bottom disc revolves instead of the upper, the sand particles rotate better between the two discs at the period of crushing, and so cut the metal to a less extent, and also the crushed particles pass more quickly away. Undoubtedly no method of grinding between two parallel surfaces of metal can surpass this simple and almost primitive device, and cost of it is probably less than that of any other machine of like capacity. Yet all grinding between parallel surfaces unavoidably involves considerable loss of shoe and die metal.

Power is consumed by that as well as any other means of making a hard ore very fine. When one considers the square surface area of cleavage involved in breaking a ton of ore to pass a 200-mesh screen, the power involved, without allowing for loss in its mechanical attainment, appears formidable in ratio with the hardness and toughness of the ore in hand. If a solid cube of rock weighing one ton is cut into cubes measuring $\frac{1}{100}$ of one inch, it involves a cleavage of approximately 15,600 square feet; yet if a sample could be had solely of such small cubes, it would appear as fine sand and not as slime. It is quite probable that a pulp that has passed a 200-mesh screen would more nearly represent three or four times the afore-mentioned area of cleavage.

It is not possible, at least commercially, to obtain as fine a product from grinding between two parallel surfaces of metal as that produced by a tube-mill, still it is not yet safe to say that there are no situations wherein the grinder is more advantageous than the tube-mill, and this without reflection upon the success of the latter.

The commercial profit line is affected by characteristics of environment as well as characteristics of an ore, and in one locality it might be profitable to grind an ore finer than the same ore in another locality, so that every individual case must be determined apart. Data of costs and conditions bearing upon other ores when treated by different means, are an assistance in forming a decision as to what course to pursue in any given case; but decision must be made by individual judgment and not by fixed rule.

M. P. BOSS.

San Francisco, Feb. 12, 1906.

Distributing the Profits.

The accompanying diagram represents a pyramid of gold 14 ft. 7½ in. high, with a base 5 ft. 6½ in. wide, this being the amount of gold won from the Mount Morgan mine (in Queensland, Australia), from July, 1886, to May, 1904. The gold weighed 2,623,734 oz., valued at £11,150,870 or $54,081,720. Of this total, the Queensland government's portion was £429,432 or $2,082,745, the public's portion was £4,309,104 or $20,899,154, and the shareholders got £6,412,334 or $31,099,819.

The details are given herewith:

QUEENSLAND GOVERNMENT'S SHARE, £429,432.

PAID TO QUEENSLAND GOVERNMENT.

	£
Dividend duty	207,708
Royalty	65,842
Railage	74,563
Railway sidings	8,425
Customs' duties, direct	31,116
Customs' duties, indirect	25,821
Telegrams, cables, and postage	8,513
Leases and Miners' Rights	4,103
Stamp duty on insurance policies	2,380
Cheque books	931
	£429,432

PUBLIC'S SHARE, £4,309,104.

VARIOUS EXPENDITURE.

Materials produced in Queensland—Billet wood, charcoal, manganese, coal and coke, timber, horse feed, general stores, machinery, etc.	675,089
Other Queensland expenditure	237,168
Wages, salaries, and contracts	2,650,016
Stores, etc., imported (purchased in Australian and foreign markets)	746,831

SHAREHOLDERS' SHARE, £6,412,334.

Dividend and balance in hand	6,412,334
Grand total	£11,150,870

From May, 1904, to May, 1905, the government received £34,267 or $166,195; the public, £376,010 or $1,823,648; and the shareholders, £168,771 or $819 039; the total output being £579,048 or $2,808,882. Therefore the total production of the mine in 19 years has amounted to $56,891,602 and out of this the profits earned have been no less than $31,918,858, or 56%. This is a splendid record.

MAGNESITE DEPOSITS OF CALIFORNIA.—The market for native magnesite may be influenced in future by the fact that a factory for the manufacture of magnesite brick has recently been erected in East Oakland. It is as a material for making refractory brick for lining cement kilns and smelting furnaces which carry basic slags that magnesite finds its most important use. The magnesite brick made in this country has, up to the present time, been manufactured in Pennsylvania out of magnesite imported from Greece or from Austria, which has been cheaper than magnesite brought across the country to the steel furnaces from California. It remains to be seen if the manufacturers of steel in Pennsylvania will not find it cheaper now to transport the California brick than to buy brick made in Pennsylvania from imported magnesite. Nearly all the magnesite known in the United States is found in a belt of serpentine that extends from southern California along the coast range to Oregon. In the northeastern part of Santa Clara county, 32 miles southeast of Livermore, there is a deposit on the exploitation of which a large amount of money has been spent. Several big veins have been opened, and development has been proceeding by open cuts and tunnels. The magnesite is transported a half mile over an aerial tramway to bunkers and thence by traction engines and iron wagons to Livermore. Near Portersville, in Tulare county, about 275 miles southeast of San Francisco, lies a second magnesite deposit. These mines, which are worked by tunnels and open-cuts in veins, are operated by the Willamette Pulp & Paper Company of San Francisco. Mr. W. P. Bartlett is superintendent of the works. Nearly all the magnesite produced here is burned at the mines with fuel oil, just as limestone is burned to make lime. The burned residue—magnesia—which is used by paper mills for digesting and whitening wood pulp, is shipped to Oregon City, Oregon. The small portion of magnesite not burned is used in its raw state by the Western Carbonic Acid Gas Company of San Francisco, for the manufacture of liquid carbonic acid gas in its plant at Sedan. At Chiles Valley, in Napa county, there are old magnesite deposits which were worked for about 12 years.—*U. S. Geological Survey.*

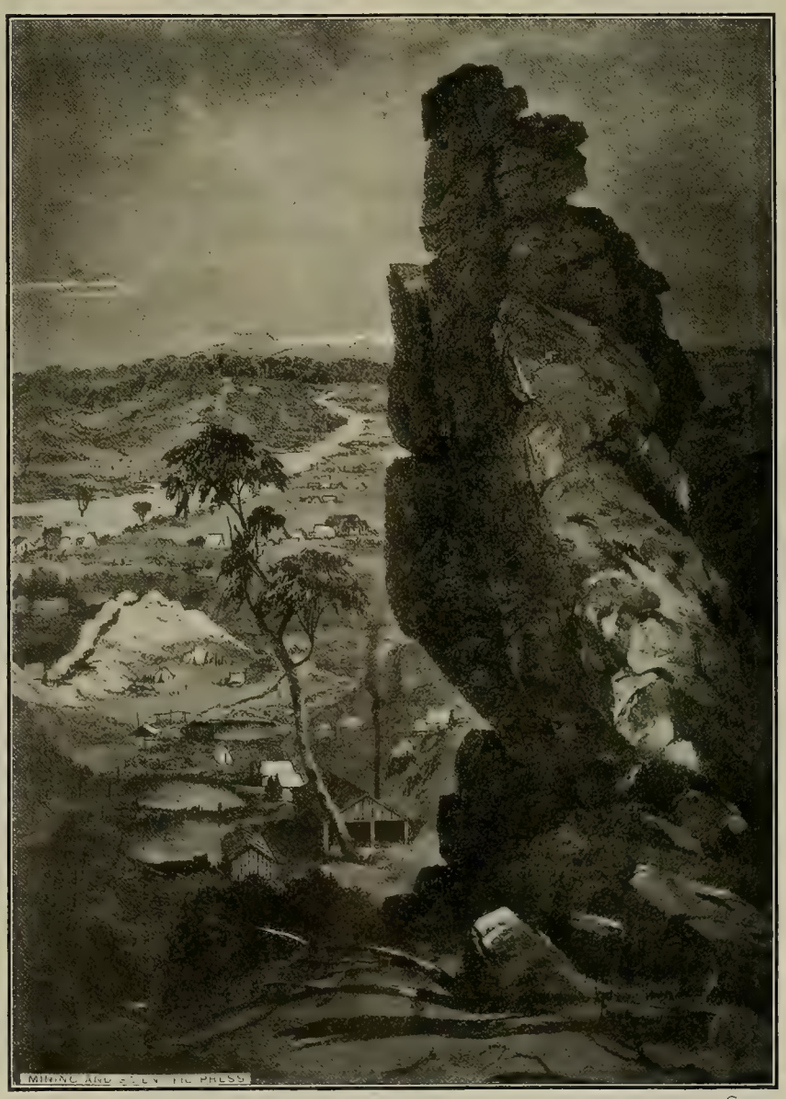
Gold Mining at 4,000 Feet.

Deep sinking is a problem which Bendigo mining investors have been endeavoring to solve for a number of years past. George Lansell was the first to grapple with it. He offered a bonus to the company which would first reach a depth of 3,000 ft. with its shaft; but he did not have to make any award, for he got down there first with his No. 180 mine. In those days even the miners spoke somewhat with awe of the prospect of working at a depth of 3,000 ft.; now, with work proceeding below 4,000 ft. in the New Chum Railway and the Victoria Quartz Reef mines, no appeal is made to the imagination. It has been left to the New Chum Railway, seconded by the Victoria Quartz, to pioneer the deep ground. It was fitting that this should be done by a mine which was the producer of the deepest rich reef worked up to the present; that reef was cut at about 3,000 ft., and it yielded £98,000 in dividends. Since then the manager has sunk through another 1,000 ft. of practically barren country. Buoyed up by the manager, C. S. Rowe, who holds a large interest in the property, the shareholders have at no period lost heart in the venture. Of all the difficulties to be faced heat was the worst. The shaft was deepened from 3,200 ft. to 3,856 ft. without serious trouble, but the extension of the crosscut east at that depth was a laborious task; it traversed for the greater part the hardest kind of sandstone, and the heat was such that a spray had to be kept playing on the men as they worked in the face, stripped to the waist. At the plat, near the shaft, a shower-bath cooled the heated bodies of the truckers. When the crosscut had passed through the anticline without result, the sinking of a winze in center country was decided upon. But first of all more air was wanted. So a raise was put up from the crosscut to connect with a winze sunk from 3,200 ft. It was so hot in that raise that the management decided to experiment with ice, in the hope of cooling the workings. Several hundred pounds were placed over the crosscut, but it melted too quickly to appreciably lessen the appalling heat thrown off by the rock. The spray was the men's comfort. Without it the raise would never have connected with the winze. Then the winze below the 3,856-ft. crosscut was started. For 18 months it has been in progress, and now it is down about 374 ft. below the crosscut, making the total depth of the workings 4,230 ft. At a depth of 4,165 ft., or when the winze was 309 ft. below the crosscut, the first discovery of quartz was made. It proved to be the top of a formation, and as the winze was deepened it opened up the western fringe of the reef. Fair prospects of gold were occasionally seen, but the west leg did not turn out as well as it had promised. It was with the object of proving the eastern portion of the reef, or the east leg, that a crosscut was started from the winze at 4,226 ft., and much gratification was afforded shareholders by the fact that the leg is 4 ft. wide at the point of intersection, and that it is rich in gold. They also had the satisfaction of having struck gold at the deepest point yet known in mining.

The Victoria Quartz has been a close follower of the New Chum Railway, and, judging by recent developments in the winze which is proceeding below the 3,824-ft. crosscut, the enterprise of the shareholders is likely to be rewarded. The bottom of the winze is now 4,110 ft. from the surface, and for about the last 10 ft. it has traversed a network of gold-bearing spurs. The last firing-out disclosed 3 ft. of quartz under a slide, and the indications are that this ore, in which a few fine colors of gold were observed, has connection with the cap of a formation. Whatever may be the reward the shareholders will receive, they deserve the praise of all mining men for their perseverance and pluck. The company paid their last dividend in June, 1900, and the money came from the profits won from a reef worked between 2,606 ft. and 2,704 ft. It is a long way from 2,704 ft. to 4,100 ft. through solid rock, and every foot of it made its impression on the company's finances. But gold gets gold, and the shareholders philosophically paid their calls. The winze was started from the 3,700-ft. crosscut, and only one shift was employed in it, and it has taken the two men who work in the bottom about two years to get to the present depth. Their work has been laborious and trying, but the conditions in the winze, strange though it may at first appear, are pleasant in comparison with those which ruled in the 3,700-ft. crosscut when it was being extended from the shaft. The heat was intense in the crosscut, because there was no connection between it and the upper levels, save through the shaft, and consequently the air could not circulate freely. At the end of that crosscut the heat from a single candle, which wasted away in grease in my hand, appeared like the glow of a coal-fire. I recollected that the flame of the candle was consuming more air than a man, and I extinguished it, and felt that I ought to be able to draw a deeper breath. And ever after I wondered how the two men at the rock-drill could smoke their pipes with evident enjoyment.

Now, however, the 3,700-ft. crosscut is connected with the upper levels, and a get-away is provided for the air after it has reached the bottom of the winze. From the shaft the air-current passes along the 3,824-ft. crosscut down the bucket-compartment of the winze, and, turning under the timber above the heads of the men at work in the bottom, ascends the ladder-compartment, and courses through the workings until it reaches the 3,310-ft. level. From there it finds its way to Mr. Lansell's 180 mine, and through its shaft to the surface. It has filled its mission, and it would offend the lungs of any toiler of the surface. Give the air an inlet and an outlet, and it can be easily trained. Wilfred Rickards, the manager of the Victoria Quartz, knows this, and he has made excellent use of his knowledge. At the plat at the 3,824-ft. crosscut the temperature is only 73°, while at the bottom of the winze it is 84°. Of course, temperatures are much warmer to the system at such depths than they would be in the open air at the surface, but they are by no means unbearable. The figures are much below those recorded in the New Chum Railway, that is, 85° in the 3,856-ft. crosscut, and 90° in the end of the 4,226 ft. crosscut; but it must be remembered that that company's shaft is an upcast, while the Victoria Quartz shaft is a downcast. That is to say, the New Chum Railway gets its air through the Eureka mine, and not direct from the surface, like the Victoria Quartz.

Fears have often been expressed that the great heat will interfere with deep operations; and so it will, if proper measures are not taken to provide good ventilation by letting air course through the workings to take away the heat thrown off by the rocks. Free ventilation means comparative coolness, and the best way to bring that about is by connecting level with level by winzes and raises. In making those connections the worst hardships will be entailed, but a proper study of artificial methods of cooling the workings will render the men's work much less laborious, and save the companies expense. Down at 4,226 ft. a man is not the man of the surface. The weight of air depresses him. He may crack a joke, but it falls flat, and the smile that appears on the listener's face is the illumination of only an instant. As soon as he gets below 3,500 ft. the ear-drums are affected for a few seconds. His companion in the cage seems to be talking under his breath. But the recovery of hearing is as quick as that of eyesight after groping for several minutes about a dimly-lighted plat. An ascent in a cage of nearly 4,000 ft. in a downcast shaft is a ride as breezy as a motor-car could provide, and as the surface is neared one's teeth chatter. Perhaps the sunlight on top is a little dazzling at first, but there is no mistake about the beauty of the blue sky, even to eyes that have seen gold under its most fascinating conditions, set in white quartz, side by side with silvery galena and mundic, and revealed from the gloom of the world's deepest gold mine by the glimmer of a candle. One thing those who go deep down can ever after appreciate, and that is a hilltop in a fresh breeze. — From *The Argus*, Melbourne.

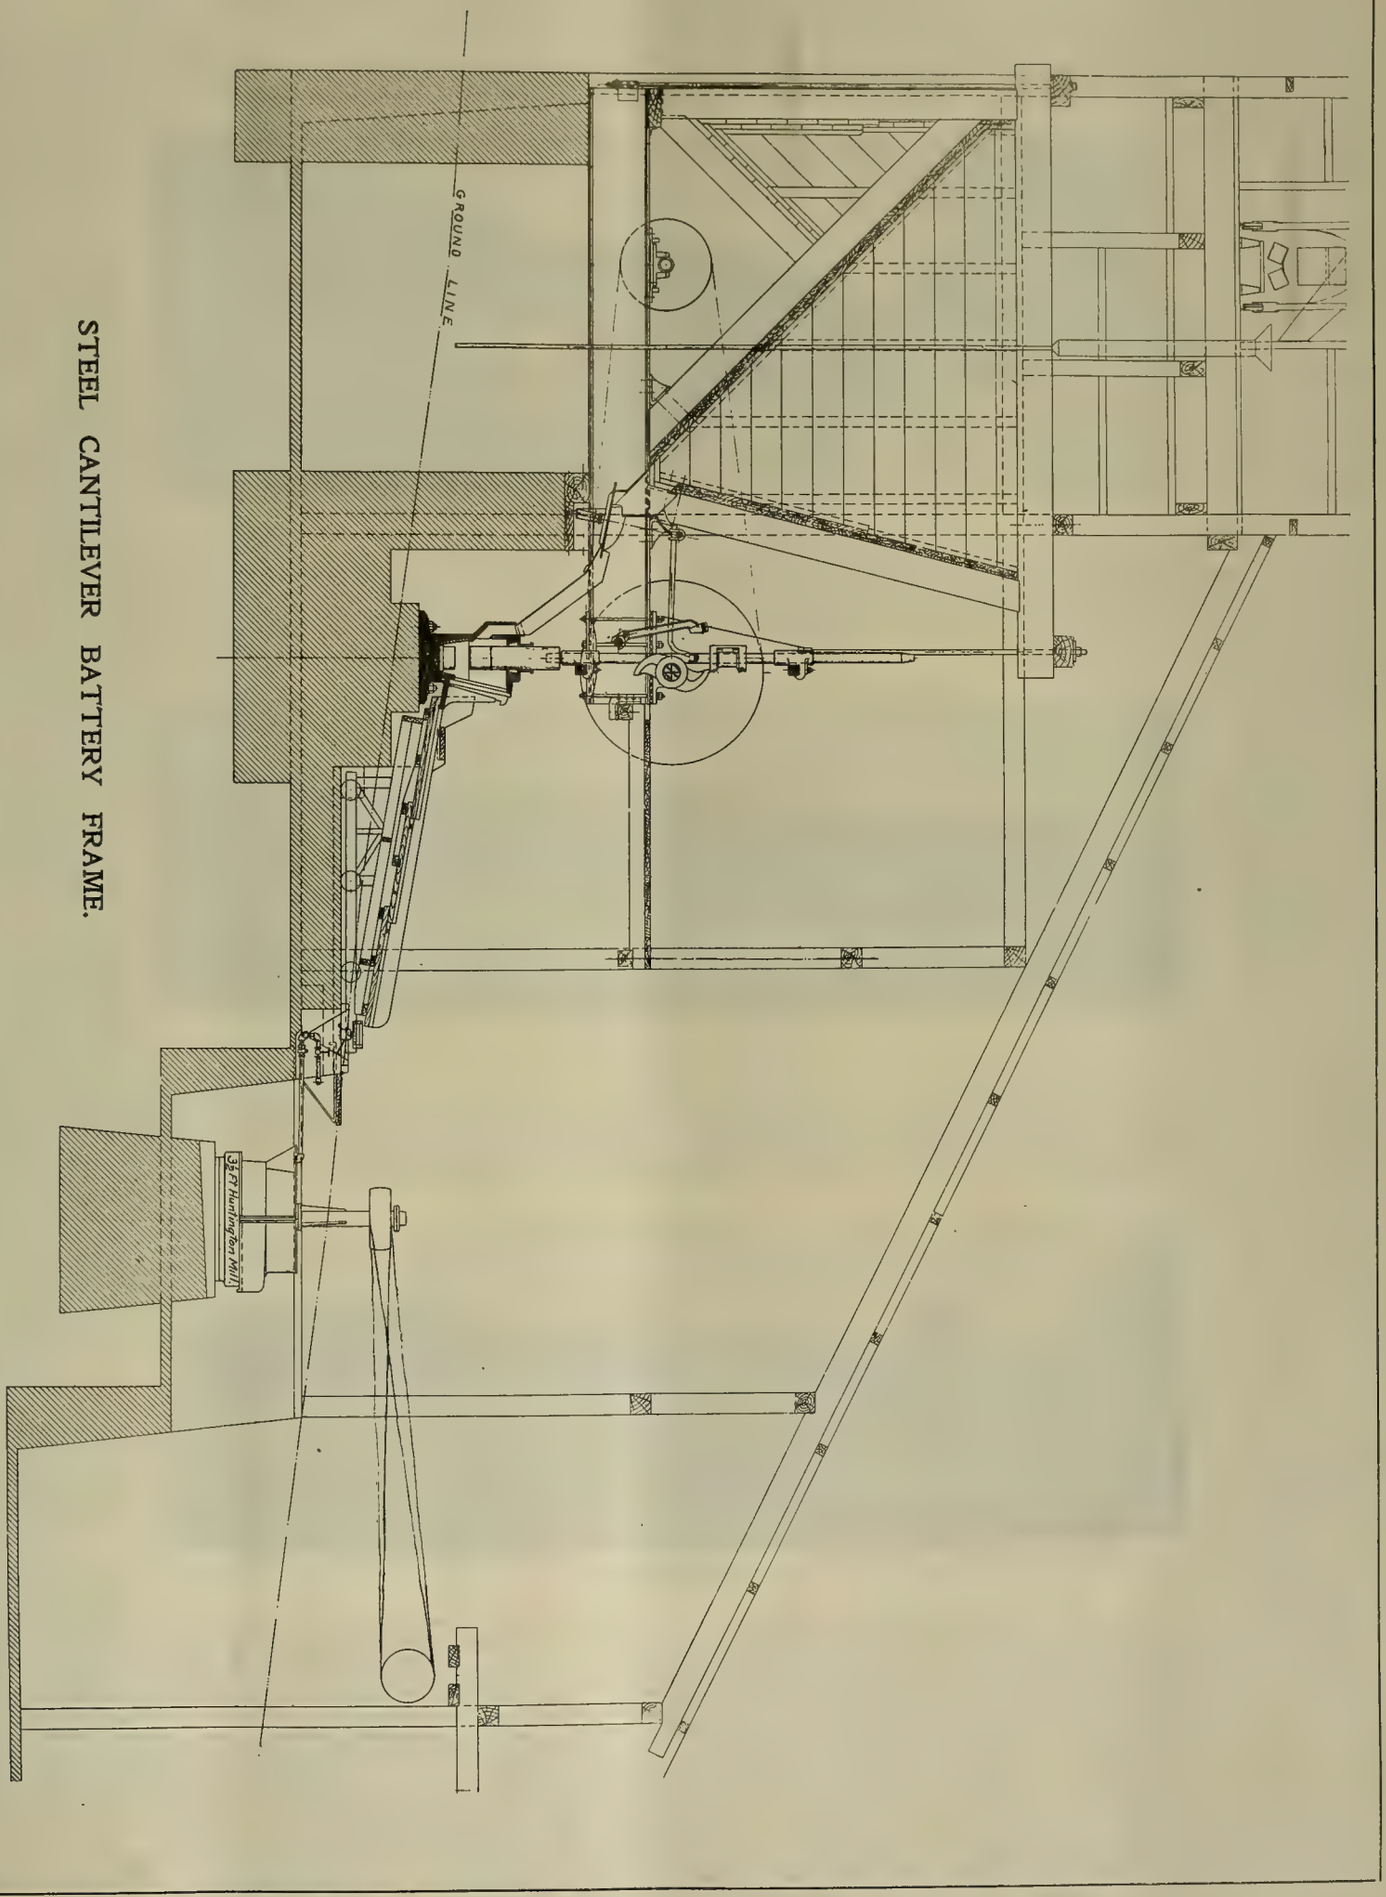


Bendigo in 1851, Illustrating the Outcrop of the Leg of a Saddle-Reef.

Cantilever Stamp Battery.

On the opposite page we publish a drawing of this interesting departure in stamp-mill design. The distinguishing features are the absence of wood in the construction, and the wide clearance around the mortar. The mortar is easily accessible and the stamps are readily hung up by means of latch-fingers operated by levers placed in front. The boss-heads are large and project from the top of a shallow mortar; this arrangement permits of placing the guide close to the stamp and reduces the breakage of stems to a minimum. The cantilever steel battery-frame is the invention of that veteran mill-constructor, Mr. M. P. Boss, of San Francisco. The first battery of this type was installed at the Midway mine, Tonopah, and another was built for the Combination Mines Company, at Goldfield. At the latter mill a few minor defects in the first design were corrected and the results have proved most satisfactory. A nine-months' trial was made with two five-stamp batteries. Two additional batteries of the same design are now being erected. In the Combination mill not one stem has been broken in nine months; and there is no record of any such breakage in the Midway mill during a much longer period. The design affords compactness and rigidity; the mortar rests on a block of concrete, with a rubber sheet interposed, and is tied above, by means of heavy rods, to the top of the ore-bins. Vibration is reduced to a minimum. For these data we are indebted to Mr. F. L. Bosqui, who became familiar with the working of the mill while making cyanide tests at Goldfield.

PRODUCTION OF CEMENT.—California a few years ago was one of the great importing States. Vessels from Germany and England, bound for the Pacific Coast for grain cargoes to Europe, usually carried portland cement as ballast, or at extremely low rates of freight, and the western coast of the United States remained one of the largest markets for the European brands of cement. Today California has three works, and one of these is in process of enlargement, so that it will become one of the great producers of the country, and very likely will supply large quantities of cement to Mexico and Panama by reason of its easy access to the sea. With the development of mining and irrigation, cement plants have been constructed both in Utah and Colorado, and their capacity is to be largely increased.—Robt. W. Lesley in *Eng. & Min. Journal*.



STEEL CANTILEVER BATTERY FRAME.

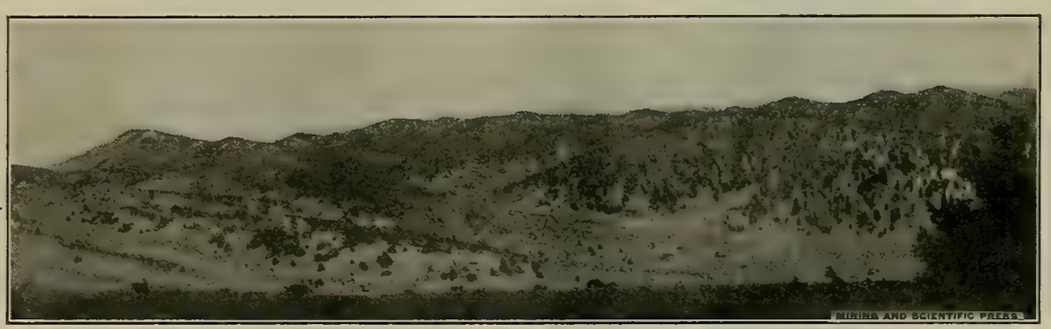
Manhattan.

It is difficult to get accurate information about a new mining camp. As a newly born infant seems to the fond parents to be without question the finest of its species, so a new gold district is to its discoverers and promoters the Colchis of their dreams. Manhattan is producing rich ore and if, as yet, it comes only in sacks and not in carload lots, it is because the stuff is very rich and will pay expensive transport—the only kind available until a branch railroad is extended from Tonopah, a distance of 55 miles; this event is expected in April. A wagon road is being built from Manhattan to Mina on the California & Nevada Railroad.

The town lies in a canyon three miles in length and has but one street, which is nearly a mile long. The rich gold discoveries have been made on both sides of the canyon. The tent lodging-house accommodations are not equal to the demand at present. There are 3,000 men at the new camp and the influx from the surrounding region is likely to continue. About one-half of the inhabitants have come from Goldfield and a thousand from Tonopah; but the distant mining centers are poorly represented. There is evidence of confidencein the future of Manhattan, for merchants are bringing large stocks of goods with them; warehouses, office buildings, saloons and gambling dens are being erected on every block.

Looking Across the Main Street.

Two banks are in operation. The streets are lined with people day and night, and the air vibrates with excitement. Every new strike reported adds to the electricity in the atmosphere. At least 300 lessees are now at work, and many applications for leases are being received by mine owners. On lease No. 14 of Union No. 9 claim, a shaft is down 65 ft. on a 5-ft. vein of rich ore. The lowest assay taken was $90 and the highest $250, while some selected samples of specimen rock go into the thousands. Moreover, the formation, which at the top was decomposed and flaky in appearance, is now a quartz of the Goldfield kind. On the Briggs lease, also on Union No. 9 claim, the lessees are down 50 ft., and they declare that they are taking out ore at the rate of $100 per hour. Returns just received from the Columbia Sampling & Ore Company for two cars of ore shipped from the Hudson lease on the Stray Dog claim show an average of $460 per ton for the entire shipment. This consisted of a talcose spar and was taken so near the surface that decomposed grass-roots could be discerned in the ore. On the April Fool claim of the Seyler-Humphrey Mining Company the lessees are taking out ore from which some big assays have been obtained. Much attention is being attracted to the Black Mammoth and Black Mammoth No. 1 claims, owned by the Manhattan Combination Mining Company, of which L. L. Patrick, organizer of the Combination Mines Company of Goldfield, is president. These two claims lie a few thousand feet south of the Mustang. On them is seen the best defined outcrop in the district. Two shifts have been put to work. On the Iron King and Iron Queen claims, owned by the Manhattan Cowboy Mining Company, 16 lessees are at work. Three of these are already in ore, and one of them is sacking high-grade stuff. One strong, well-defined ledge and a network of cross-veins are opened up on the Mayflower, Stray Dog, Annie Laurie, Union No. 9, Iron King and Iron Queen, Jumping Jack and Reilly Fraction, which form a composite group. Among the principal mines are the Broncho Lease No. 1, the April Fool, the Mustang No. 1, and Leases No. 6 and 8. The Manhattan Gold Mines Company has been organized to operate these leases, as well as the Granite group. Charles F. Kapp, of Manhattan, and Volney T. Hoggatt, of Denver, a brother of Wilford B. Hoggatt, Governor of Alaska, are the principal members of the company. The Iron King and the Iron Queen mines were recently bought and on these claims there are 17 leases. Five of them are shipping ore ranging in value from $2,500 to $3,400 per ton, according to the report of E. E. Stewart. The specimens show free gold in abundance. A large block of shares is said to have been bought by the Guggenheims, of New York, the sale being negotiated by J. J. Mack.



Manhattan, Nevada.—Beginning of Town Seen in Center of Illustration

The new city will soon be lighted with electricity. Mr. Kapp has organized an Electric Lighting Company, with a capital of $1,000,000, bonds to the amount of $200,000 having been issued. Engineers are making the necessary surveys, and the general manager, Karl J. Young, is securing the necessary equipment for this enterprise.

Lessees at Work.

The conflict over the claims of the Manhattan Dexter Mining Co. has been settled in two instances. The courts will have to decide the merits of other issues. The title to Union No. 2 and Union No. 3 claims, which was disputed by Rakestraw & Norton, has been settled by the organization of the Manhattan Union Mining Co. The Manhattan Dexter Mining Co. conceded to this company the Union No. 2 and Union No. 3 claims, and Rakestraw & Norton turned over to it the Turtle Dove and Big Mogul claims, which adjoin the Union No. 2 and 3. The Union No. 9 claim of the Manhattan Dexter Mining Co. is not in conflict. Title to the other 17 claims is contested. The hearing will be before Judge Breen, Feb. 20, in Tonopah, and the merits of the controversy will then be decided.

Some of the best mining talent in the West is at Manhattan and is engaged in examining formations and tracing ledges, with a view to gobbling up, at normal figures, any properties that are likely to carry an extension of the veins in evidence on the Broncho, Mustang, April Fool, Mayflower, Stray Dog, Jumping Jack, Annie Laurie, Iron King and Iron Queen claims.

GOLD MINING IN JAPAN.—At present the chief alluvial mines in Japan are in Hokkaido, the output from Kyushu having fallen off in late years. Not much information is yet available as to the extent and value of the Formosan deposits, but they are of rapidly growing importance. During 1902 the principal alluvial mines in Hokkaido gave the following outputs: Shintotsugawa, 6,616 oz.; Usotannai, 4,074 oz; and Peichan, 2,196 oz. The cheapness of the labor and of the plant required, as well as the skill of the Japanese in washing poor gravel, permit these placers to be worked profitably, but the climate makes it necessary to shut down during winter. The chief apparatus employed in washing the gravel are 'long toms' and 'cradles.' Wooden washing dishes, rectangular in shape, are much used. So far, except on a small and primitive scale, no hydraulicking has been attempted. In Japan proper, the future of placer mining is likely to be but a moderate outlook, even with the introduction of better appliances and more modern methods of washing gravel. Sufficient is not yet known of the Formosan alluvial deposits to allow a trustworthy opinion to be formed of their value. It is in the mining of auriferous deposits, other than placers, that the bulk of the future gold supply of Japan may be looked for. The distribution of the reef gold produced in the different mining districts during 1902 was as follows: Sapporo, 1,120 oz.; Sendai, 5,917 oz.; Tokyo, 19,780 oz.; Osaka, 15,149 oz.; Fukuoka, 26,390 oz.; total, 68,356 oz. Speaking broadly, the deposits in Honshu, with the exception of those at Sado, Ikuno and Innai, though rich in places, are generally small. In Kyushu, and especially in the southern portion called Satsuma, good orebodies occur, usually in the form of large low-grade orebodies, wholly contained in andesitic rock. Several of these are now being worked, though mostly in a primitive manner.

ANTIMONY.—The chief ore of antimony is the sulphide (stibnite, or gray antimony) Sb_2S_3, which when pure carries 71.4% of metallic antimony, or 1,428 lb. to the ton. Another important ore is stibiconite, or antimony ocher, the oxide, Sb_2O_3, which at the maximum contains 74.5%, or 1,490 lb. to the ton. Although antimony minerals occur in many localities in the United States and considerable quantities of stibnite are known in South Dakota, Utah, Nevada and California, the only State reporting production in 1904 was Arkansas, and the quantity from there (12½ tons) was an insignificant fraction of the total amount used in the country.

BENDIGO has produced, from 1851 to 1905, inclusive, no less than 18,200,000 ounces of fine gold, which is equivalent to 560 tons of metal.

Mining Methods—II.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS.

Several of the most important mines of the Mother Lode are operated through a single shaft, though some have two shafts and others three, but in every case there are hundreds of feet longitudinally along the vein to be developed and stoped from these shafts.

The usual mining practice is to drive a drift (or crosscut if necessary), to the vein from the station at the shaft. This cutting may, or may not, at once encounter ore. In case of no ore being present in the fissure, the drift is continued along the vein in search of the ore-shoot. This drift must be timbered in a most substantial manner, the timbers being seldom less than 24 in. diam. and often larger. The gangway is generally cut 9 to 10 ft. high, 8 to 9 ft. wide at the top, and 10 to 11 ft. wide at the bottom, the posts being given considerable spread. When timbered, the drift is 3½ to 5 ft. wide at the top, 7 ft. high and 7 or 8 ft. wide at the bottom. It has been found advisable to cut these large gangways owing to the peculiar conditions encountered.

The fissure may vary from 3 or 4 ft. to 40 ft. in width, and it may be filled partly or wholly with quartz, the remainder of the space being filled with the gouge, and whether the fissure contains quartz or not, the ground is heavy. As soon as pay-ore is found it is hoisted from the mine and sent to mill, the drift being continued along the vein. Stopes are started and mining proceeds in the usual way. Ordinarily, there would be no objection to mining in this manner, but not infrequently it is several hundred feet to the property line—often 1,000 ft. or more, and seldom less than 100 ft. to the level above—and all of this gangway must be kept open by constantly relieving the timbers, and often re-timbering, which is more expensive than the original work, until this entire level has been explored and all the ore stoped and removed to the surface, for in such ground it cannot be broken and permitted toremain in the stopes until it is convenient to withdraw it, as may be done in mines where the walls are hard. In some of the largest mines several levels at one time are thus worked and maintained in the manner indicated.

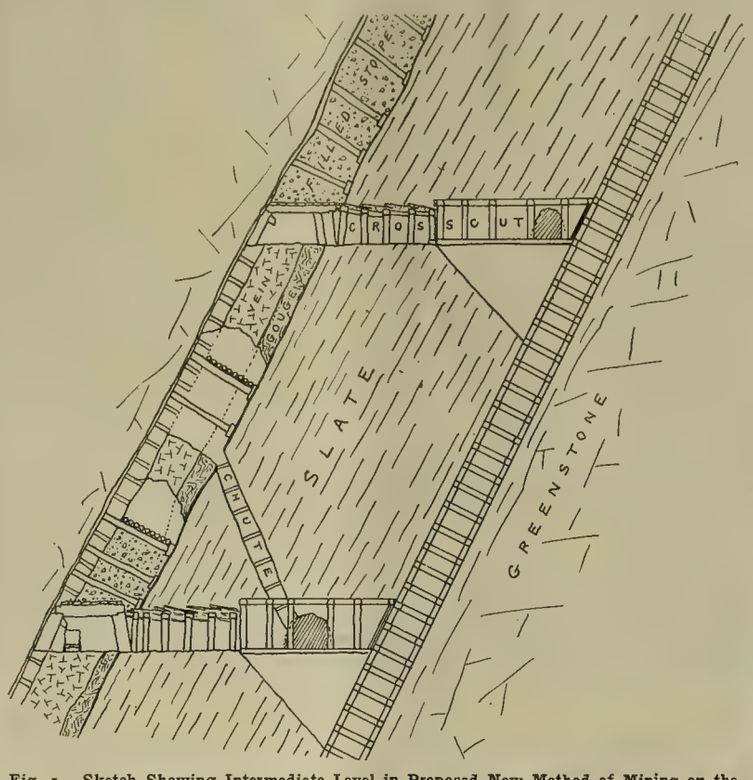


Fig. 1. Sketch Showing Intermediate Level in Proposed New Method of Mining on the Mother Lode.

In consideration of the conditions and consequent expense here obtaining, under present methods, the need of a system which will in some measure obviate the necessity of doing several times over the work already performed, is apparent. The success attending the experiment of sinking main working shafts in the country rock, and of cutting drifts in the hard foot-wall around a bad piece of swelling ground, certainly points the way to an improvement in the system of mining as now practiced on the Mother Lode of California.

As between the advantages offered by vertical and inclined shafts, engineers often disagree, but where the conditions are as found on the Mother Lode, after over 50 years of mining and a development to the depth of half a mile or more, there should be no doubt which is preferable. The fissures of the Lode in Amador county, where most of the mines here discussed are situated, dip at about 63°, and while vertical shafts reach a given depth on the vein in less distance and therefore usually at less expense than inclines sunk in the hard foot-wall country, yet, on the whole, the advantage seems to be in favor of the incline, as the expense saved in sinking the vertical shaft is in most cases more than offset by the cost of driving crosscuts to reach the vein—a matter of no little consequence in the operation of a mine to a depth of 2,000 ft. or more, particularly if levels be established at every 100 feet.

The main gangways should, in my opinion, be cut in the foot-wall at a distance from the vein, which will avoid the heavy, swelling ground adjacent to the fissure. Ordinarily this can be found at 40 to 60 ft. from the vein. Should the shaft be an incline, as here suggested, this crosscut of 40 to 60 ft. would largely be taken up with the station plat and ore-bins beneath, which would be a necessity at either an incline or vertical shaft. From the gangways, crosscuts should be run to the vein at stated intervals—the distance to be determined by the size and character of the vein. Where the ore is wide, the crosscuts should be made at more frequent intervals than where the pay-streak is small, as the time required for the extraction of any particular block of ore is always an important matter in these calculations. The crosscuts may be made at points from 180 to 240 ft. apart, according to the size of the vein. Raises should be put through from each level to that above, and these should be started as soon as stoping commences, or just before that time, and driven as rapidly as possible, in order that the cutting may not be closed by the heavy ground, and if one wall gives less trouble from this cause than the other, the raise should preferably be made on that side. If ventilation be good, it may be well enough to put up the raises as the stope progresses upward, instead of in advance of it. Ordinarily, however, ventilation is none too good, as the air in these stopes is hot, close, and laden with the vapors and foul gases characteristic of mines, and this condition the through connections from level to level help greatly to mitigate.

It is noticed that there is an almost universal tendency to drive stopes longitudinally on the vein faster than they are carried upward; that is, too much ground is kept open at one time. This operates disadvantageously, as a greater length of time is required to extract a block of ore from one level to the next above. If the stope be made shorter, and haste be made in an upward instead of in a horizontal direction, there will be required a less time to keep the ground open. If, as suggested above, the crosscuts be driven at intervals of, say, 240 ft., and the vein opened both ways from this crosscut, the first raises would be put in 15 ft. to the right and left of the crosscut, then beyond each additional raise or mill-hole is located at 30 ft. from center to center. If there be four raises on both sides of the crosscut, these will command 120 ft. of the stope each way from the crosscut. A similar series of raises from the next crosscut will make easily available the entire block of ore between the two crosscuts, and from one level to the next above. If the ore in these stopes be extracted as promptly as possible, there will be little trouble from swelling ground—far less, at any rate, than that experienced under the present method of mining on the lode.

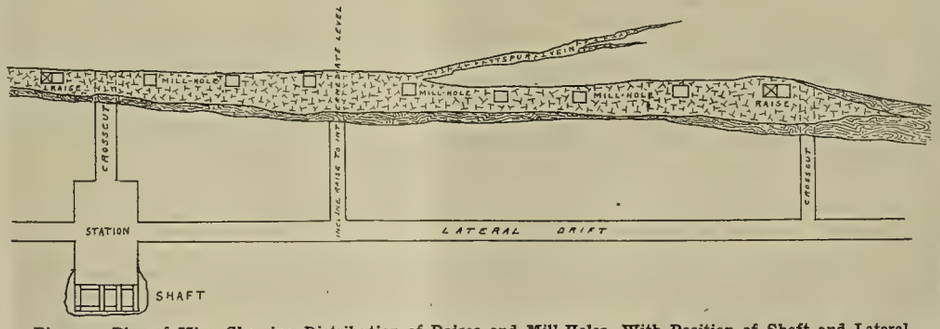

Fig. 2. Plan of Mine Showing Distribution of Raises and Mill-Holes, With Position of Shaft and Lateral Drift, in Relation to Stopes.

The putting up of raises prior to stoping not only facilitates ventilation but affords an easy means of sending timbers down into the stope from the level above, instead of pulling them up from below by means of block and tackle, or in even more crude fashion. In each stope it is not necessary that more than one raise be put through, in advance, to the level above. One of those nearest the center would serve for this purpose, or if much timber be required in the stope, the second raise on each side of the crosscut should be put through. The superintendent must exercise his own judgment in these matters. The remaining raises need only be carried up as the stope advances, being cribbed and used as mill-holes, for the passage of ore, all waste being retained in the stope for filling; additional filling must be obtained from the walls or from the surface; but in the system of mining here proposed, the prompt extraction of the ore from any stated block would probably render filling unnecessary, for the closing up of the fissure by swelling of the slate or caving of the walls after the removal of the ore would be a matter of small consequence. Here, again, the superintendent must use judgment, and if filling be necessary, it must be supplied from some source.

Employing this system of mining, it is evident that the gangway on the vein need only be kept open so long as necessary to remove the ore from the block above the crosscut. This system possesses the additional advantage of stoping the ore in alternate blocks if desirable, though in most of the mines this would be of doubtful benefit.

The system proposed is not inflexible and may be adjusted to meet various conditions. For instance, if the ground be particularly bad, an inclined raise may be driven from the main foot-wall gangway, to reach the vein at a point midway of the two levels, and an upper or intermediate stope be opened at that place, which is worked upward to the main level above, while the stope from the level below goes only to an intermediate drift. The employment of this system must necessarily, if properly directed and vigorously prosecuted, shorten the time required to remove a block of ore, and the gangways cut in the heavy vein need only be once timbered, as in most cases all of the ore in the block immediately above the gangway sections would be removed before extensive repairs became imperative, thus cheapening the cost of mining—something which every earnest superintendent constantly strives to accomplish.

FITTING PIPES.—If, when a piece of pipe is screwed into a fitting it is out of line, it is a very simple matter to determine, by turning the pipe a half-turn, whether the trouble is in the fitting or in the pipe. If the pipe then maintains its original alignment, the trouble is in the fitting; but if the pipe slants in the opposite direction, it is apparent that the difficulty is in the way the threads have been cut on the pipe. Crooked threads on pipe are usually threads that are cut by dies in stocks, and are caused by the fact that the distance between the die and bushing is too short. In cases where the bushing is badly worn, the die is as apt to cut a crooked thread as a straight one, as the bushing does not keep the die in alignment with the pipe.—*Valve World.*

MAGNESITE IN CALIFORNIA.—Magnesite is used not only as an ingredient of magnesite brick, but also in the manufacture of carbonic acid gas and in the manufacture of paper from wood pulp. The carbonic acid gas is liquefied and shipped in steel cylinders to all the Pacific coast and southwestern States, where it is used for soda-water fountains, for refrigerating machines, and for maintaining the pressure on beer barrels and keeping the beer fresh. In the manufacture of paper, magnesite is transformed into a sulphite of magnesia and used as a digester for the wood pulp. Small amounts of magnesium chloride are used for making cement. Combined with asbestos, magnesite is also employed as a filler in steam-pipe casings. But it is as a material for the manufacture of refractory brick that magnesite finds its only considerable market, and with the development of that industry in this country the exploitation of California's magnesite deposits would greatly increase. Magnesite is a native carbonate of magnesia.—*U. S. Geological Survey.*

The Ore Deposits of the Ontario Mineral Belt.

Written for the MINING AND SCIENTIFIC PRESS by WALTER P. JENNEY.

Two erosions have occurred in this region. The earlier followed the continental elevation at the close of the Carboniferous, and occupied the time-interval until the advancing sea in the Mesozoic covered the hills and deposited the great thickness of shale and sandstone along the northern flank of the lode. The later erosion appears to have begun in the Jurassic and to have continued until the present time. Much of this recent denudation of the surface has taken place since the formation of the vein-fissures and the deposits of ore. Over the outcrop of the Ontario mine, the combined effect of these two erosions removed the whole thickness of the Upper Carboniferous limestone, together with 500 to 700 ft. of the underlying Ontario quartzite.

Owing to this late erosion, which has carried away the upper parts of the veins with the enclosing stratified formations, many verticals that formerly reached to veins (on their rise) at a higher level, now terminate at the surface. Some few seem to have been 'run off' verticals, short-circuiting the vein with the surface. In the deposition of the mineral, these fissures which leave the hanging wall and go directly to the surface, were the paths of escape for the spent waters and vapors—the run-off from the lode after the circulating solutions had been deprived of their metallic burden. (See Fig. 1). If the lode be compared to a river, fed by numerous branching streams, these short-circuiting verticals become the delta-phase of the circulation. Not infrequently these fissures carry ore and form workable branch-veins, uniting with the main lode in depth. More often they are barren, even where they depart from an ore-shoot. It is noteworthy that the crest of an orebody is usually situated at the intersection of the lode by a fissure of this kind; also that in some instances, on the approach to the surface, the fault-movement of the lode is distributed over the several branches. Naturally such branchings weaken the vein, and it may be found to be barren in its upward extension beyond the place where it splits.

There has not been found any certain evidence of fissures older than the latest igneous dikes. Such fissures as may have existed at the time of the last intrusion are now obscured by the subsequent block-faulting. When, however, the several fissure-systems are examined, it is seen that some are relatively older, and that the occurrence of a pre-existing fault in the general line of fracture has often influenced the formation of the more recent fissure. In some cases the younger fracture terminates at the older; in other instances, the course of the younger is broken at the crossing; while the fault, although of earlier formation, is not cut or faulted by its intersection. In still other occurrences, the younger vein or vertical is bent out of its course at the crossing; in a few cases, usually where the fissures intersect at an acute angle, the younger captures and follows for some distance the older fracture, finally breaking away and pursuing its former direction. An example of the capture of an older fault by a vein is seen in the 1,400-ft. level of the Daly Judge mine. (See Fig. 2). A strong, normal fault, two feet wide, producing a vertical displacement of the strata of nearly 100 ft., is intersected at an acute angle by an east-west vein, four to five feet broad, coming from the west. The vein impinges upon the fault-plane and follows it for 50 ft., the hanging wall of the fault forming the hanging wall of the ore, then it crosses, the conditions are reversed, and the vein follows the foot-wall of the faulting fissure, finally departing, on the opposite side from which it entered. Throughout the distance of 150 ft. that the fissures are united, the shoot is enlarged to a width of 8 to 10 ft., but terminates 50 ft. east of the point of separation. The ore is pyrite, low in silver, with scattered bunches of galena, workable only in places. Each fissure is readily identified by the lines of movement, which are well preserved even when the fault and vein are merged in a common channel. The striations on the walls of the fault pitch at 60° to the east, while the vein-walls are deeply grooved horizontally.

All the volcanic rocks of the Mineral Belt are cut and faulted by the veins; even the latest dikes of dark-colored basic porphyry are faulted by them. Orebodies are frequently found to terminate against a fault-plane, but investigation shows that in each instance the ore was deposited subsequent to the formation of the fault. In fact, with the exception of minor displacements due to the settling of the dislocated strata, post-mineral faults do not occur in the explored parts of the belt. As stated, the last prominent geologic event appears to have been the formation of vein-fissures and verticals, succeeded by a prolonged period of comparative quiet, during which the ore was deposited. The time at which the deposition of mineral took place cannot be definitely fixed, except that it occurred in the interval between the opening of the Tertiary and the last Glacial epoch. On the northwest flank of the Mineral Belt the ore-bearing fissures extend into limestone of Mesozoic age; evidence that the deposition occurred after the close of the Cretaceous. The other time-limit is fixed by the glacier-planed outcrop of the Mountain Lake copper mine at the head of Big Cottonwood. Consideration of the fact that the ore is younger than any of the igneous rocks, indicates a

Fig. 1. Cross-Section of Lode and Verticals.

This illustrates the draining of the circulation in a lode by 'run-off' verticals (AA and BB) which leave the hanging wall and carry the surplus waters to the surface, the lode being barren above the point of escape. In some instances, run-off verticals carry ore and become workable veins.

late origin for the mineral. We need more investigation into the age of the ore-formations of the Great Basin; all that can now be said is that these deposits of the Ontario Belt are probably post-Miocene.

All the mineral formations are referable to a single prolonged generative period. This is divided into an early stage, marked by the widespread deposition of pyrite, blende and galena, low in silver, and a late stage, distinguished by galena associated with tetrahedrite, rich in silver—a primary enrichment whereby the low-grade pyrite and blende first formed were removed and replaced by ore of a higher grade. These depositions are not everywhere found to be co-terminous in their extension; in some instances the late up-flow was confined in its circulation through the fissures to a given locality; in other places, the enriching solutions permeated the lode to the boundaries of the original orebody, or penetrated to the limits of the ore-shoot in the favorable horizon, while a broad area in the belt, mineralized by the first incoming waters, has, from some cause, escaped deposition in the second stage.

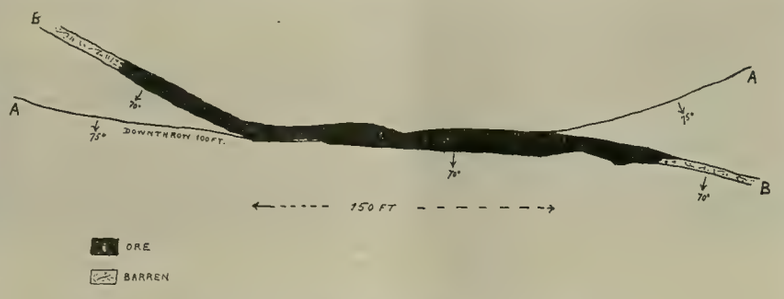

Fig. 2. Capture of a Fault Fissure by a Vein.

They have a similar dip and all displacements are prior to the deposition of ore.

There is evidence that the solutions which deposited the mineral in the lodes and certain veins (where the ore is confined to the fissure and does not extend into the walls) were of different chemical composition from the solutions replacing the limestone. It is thought that alkaline silica-bearing waters, deficient in carbonic acid, deposited the ore and quartz in the lodes, and that in the production of sheet deposits, neutral or acid waters, with excess of carbonic acid and poor in silica, dissolved the limestone and substituted ore for rock.

Oxidation extended to a depth of 400 to 500 ft. in the Ontario mine; in places, however, surface waters carried oxygen to greater depth, owing to the absence of organic matter in the Ontario quartzite. The secondary deposition of resin blende, derived from the upper part of the ore-shoot, reached from the 500-ft. level to below the 1,000-ft. level. But little secondary formation of galena appears to have taken place. The richest zone of the Ontario mine (situated as stated, where both walls were quartzite) between the 200-ft. and 1,100-ft. levels was due, first, to the extensive early mineralization; second, to the late re-inforcing deposition which reached to the confines of the ore-shoot; and third, to the overlap of the secondary enrichment by surface waters.

The Ontario Vein.—Ore comes to the surface in only a few places—the discovery of the Ontario was made in a basin formed by denudation, and it is probable, had erosion been a few hundred feet less, the vein would never have been found. This lode is a remarkable example of increase with depth (in so far, at least, as the body is confined to the quartzite), in the size of the ore-shoot and in some degree in the richness of the ore. At the surface, the width of ore was one to one and one-half feet and the shoot was less than 250 ft. long. As the vein was followed in depth, the ore went down nearly vertical on the east, but to the west it pitched at less than 30°, so that on the 600-ft. level the ore extended in a continuous sheet for 1,600 ft., with an average breadth of four feet. At the 1,000-ft. level the length of vein in ore was still greater, but the continuity of the shoot was interrupted. This expansion of the orebody with depth appears to have resulted from the peculiar conditions under which the lode was formed. In the ordinary type of fissure vein, produced by an elevatory movement commonly giving rise to an anticlinal fold, the tendency is to form fissures which are largest at the surface and contract with depth; the branch fissures also converge and are often found to unite as they are followed to the deep. If, however, the movement has been caused by a local subsidence of the crust, producing, as the case may be, either a synclinal fold or block-faulting, the disposition is for the fissures to increase in width and at the same time diverge in their extension downward. The fissures and the associated verticals of the Ontario belt were, as I have stated, produced by the differential zonal subsidence of the Uinta axis, accompanied by torsional-stress incidental to the irregular displacement. Another factor has been the deposition of the ore in the lode through verticals which occur of larger size and in greater number in the lower beds of the Ontario quartzite. The strength, however, of the lode-fissure increases with depth, as long as quartzite forms the walls, and for this reason the great expansion of the ore-shoot between the 300-ft. and the 1,100-ft. levels cannot be attributed solely to the influence of the verticals in localizing ore.

At the surface the ore assayed 80 oz. silver per ton and was completely oxidized. Rich ore carrying horn silver, resulting from secondary enrichment by surface waters, occurred between the 300-ft. and the 500-ft. levels. Below the 500-ft. level, blende was the prevailing mineral, associated with galena and gray copper, rich in silver.* The gangue was attrition material ground from the walls, mainly composed of quartzite, altered to quartz by the silicious solutions depositing the ore. The ore has deposited by crystallization in the interspaces of the gangue and by crystal-growth of particles of the metallic sulphides in the soft matrix. The prevailing character of the ore below the zone of oxidation was a mixture of soft, granular and crystalline sulphides in a loosely coherent quartz gangue. Crystallized minerals were seldom found, either in the Ontario or in the Daly mine. Horses of limestone are occasionally included in the lode, which have escaped alteration by the silica depositing waters. It is also noteworthy that neither the Ontario or the Daly vein have been found to make ore in the beds outside of the lode-walls; in this respect they are unlike the Back vein and other veins with a south dip, which form sheet-deposits in favorable horizons. Reasoning from the evidence afforded by the ore and the associated minerals, the deposition in the lodes was affected by hot alkaline waters, holding in solution the metallic sulphides and carrying silica in excess, but so deficient in free carbonic acid that limestone was not attacked. The examination of the flat-deposits formed through the verticals and the south-dipping veins confirms this, for comparatively less quartz has been deposited and the limestone has undergone extensive dissolution and replacement with ore. It is also observed in the lodes that quartz appears to deposit most readily upon some form of silica, such as quartz, and sand resulting from the crushing and comminution of quartzite. Igneous rocks with 50 to 60 per cent silica seem to be less readily silicified than quartzite, which in itself is almost pure silica. It is suggested that this peculiar selective deposition, whereby the silicious waters effected the alteration to quartz of the attrition quartzite of the lode, was by reason of that little understood chemical principle expressed by the phrase, "like seeks like," a phrase which is merely the record of an often observed fact.

The Ontario, while classed as a fissure vein, possesses features common to lodes, the filling of which is attrition material derived from the walls. The ore does not show any disposition to crystallize in parallel bands, but occurs irregularly deposited throughout the matrix. The walls of the lode are strongly striated and usually carry a thin clay selvage.

*The production of the Ontario to date is about $36,000,000, nearly all extracted from above the 1,500-ft. level.

The Daly Vein.—The reputation, justly earned, of this lode as an ore-producer,† rests upon the output of the great ore-shoot opened from the Ontario, through the Daly and Daly-West mines. The extreme length of the shoot, from its crest and termination in the upper levels in the westerly part of the Ontario mine, to the stopes between the 1,000 and 1,500-ft. levels in the Daly-West, is 4,600 ft. The pitch of this long ore-channel averages 25° to 30° from the horizontal. It crosses from the Daly mine into the Daly-West between the 600-ft. and the 1,000-ft. levels. For some distance westerly from the boundary the shoot is poor and contracted, but in the deeper levels of the Daly-West it opens out into large bodies of ore. In places, where conditions are locally favorable, the ore extends irregularly from the shoot, upward as well as downward, between the walls of the vein, forming fins, terminating in a thin edge—the dorsal and ventral fins of the ore-shoot. The width of pay-ore in the Daly mine averages three to six feet, and was in great part first-class shipping ore; in the Daly-West the shoot expands to an extreme breadth of 35 ft., mostly concentrating ore. The Daly vein is almost unexplored in the Daly–Judge property. The ore in the Daly–West is stated to assay, as mined, 6 to 7% lead, 6% zinc and 14 to 18 oz. silver per ton, together with a fractional percentage of copper and a trace of gold. It consists of an intimate mixture of crystalline galena and blende, with some pyrite and a very little chalcopyrite. Attrition material, altered to quartz, forms the gangue.

The Ore-Deposits at the Lime Quartzite Contact.—The same conditions have controlled the deposition of ore in the gray limestone at the contact with the quartzite. The lime-beds are the favorable formation, and the ore has been deposited where the beds are intersected by the veins and by the numerous verticals. The ore-formation, gently inclined or slightly rolling, conforms in each particular case to the dip of the faulted blocks of strata, in which the deposits occur.‡ The marked habit of the ore, to follow the long, sunken troughs produced by the block faulting, has been described.

The structure, as well as the chemical composition of the rock, have caused the gray limestone to be specially favorable to deposition. The position of these brittle lime-beds, held between the soft, pliable shales above, and the hard rigid quartzite below, has caused them to be shattered by the slightest disturbing movement; subsequently, in the deposition of ore, such fractured strata afforded free circulation to the mineralizing solutions, which in their flow were confined to these open fissured beds, by the much less permeable roof-shale and quartzite-floor. The quartzite and shale are only fractured where penetrated by the verticals; in the intervals between the fissures, broad stretches of both roof and floor are unbroken.

The gray limestone exceeds the other lime-formations in chemical solubility; the perfect manner in which great masses of the rock are replaced by quartz and by the minerals constituting the ore are evidence of this. Organic matter, contained in the limestone and set free by its dissolution, has aided in the reduction and the crystallization of the metallic sulphides; in fact, it may be said that the limestone has precipitated the ore.

The ore usually occurs uniformly disseminated, often replacing quite perfectly the original structure of the limestone, the bedding being preserved. The deposition of richest ore, and the most complete replacement of the lime-beds by the minerals, has taken place in the narrow belts of fractured rock, within, and in close proximity to, the fissures. From the very nature of their formation, the lateral extent of the orebodies is limited by the distance the mineral-solutions, entering through the verticals, could penetrate the fractured strata, substituting ore for the rock.

Ore deposits are not invariably confined to the special stratum of gray limestone, resting upon the upper quartzite, but occur under like conditions in other horizons in the upper limestone, where the structure and the composition of the rock is favorable. In the Crescent and other adjoining mines a number of distinct and productive ore-horizons occurred, situated in the upper strata of the black limestone.

In conclusion, the influence of the wall rocks has been discussed, and it has been shown that, in general terms, the Ontario and Daly veins were rich where traversing the Ontario quartzite, the ore high grade and concentrated within narrow limits, usually in a regular sheet, bounded by the fissure walls, with a great extension in depth and length. In the Daly, where the foot-wall was quartzite and the hanging wall formed by the upper limestone, the vein expands in width, large masses of lime shale, detached from the wall, occur in the fissure, the ore is distributed irregularly through the rock filling the vein and is commonly of lower grade; at the same time, the gross tonnage yielded by the stopes is largely increased. And that on entering the upper limestone this vein has been found, in a number of places, to be barren. These changes in the geological formations traversed by the Daly vein, while they have had a marked influence, are subordinate to the effect of the intersecting verticals, which have introduced ore directly into the vein at different points along its course.

The prevailing westerly pitch of the ore-shoots conforms to the inclination of the lines of intersection of the more prominent verticals with the vein. There is also a notable increase of width where such intersections occur, so that the breadth of an orebody frequently exceeds that of the fissure in the non-mineralized sections. The wall on the side that the vertical enters is broken and the vein-rock sheeted, diagonally fractured and brecciated, conditions most favorable to the formation of orebodies. Not only the larger verticals, but numerous branch-fissures and small verticals, do their part in thus preparing the ground for the admission of ore.

Exploration will, beyond question, develop many other ore-bearing fissures in the unexplored sections of the Belt. It has been noted that in the depths of the strata, verticals, linking the veins, occur, which do not appear at the surface; and that true veins carrying ore in regular shoots, may originate from the union of verticals. This system of veins and connecting verticals extends throughout the district, continuing to the greatest depth explored, without any marked change in the mineral character of the fissures.

The solutions depositing the ore in these veins have not followed the fissures upward from extreme depth, but have originated in sources deep-seated in the foot-country and have taken the most direct path, passing from vein to vein through the connecting verticals, finally escaping in outlets at the surface. While many contributory causes co-operated in the deposition of the ore, the most important factors were, the intersection of verticals; especially the formation within the vein of spaces of multiple-fissuring, by the complex intersection of a number of verticals, joined with the occurrence of wall-rocks, which afford, when crushed by faulting movements, an open rock-filling of the fissures, at once highly permeable to the mineralizing circulation and receptive to ore.

It follows, that under conditions similar to those here described, orebodies are to be sought in the veins without regard to depth below the surface. Examples of this localization of ore, irrespective of the surface (the deposition having been controlled by the occurrence of a favorable geological formation, conjoined with fissure intersection), are seen in the sheet-deposits replacing the limestone. In the Quincy mine, sheet-ore comes near to the surface; thence going west the ore follows the inclination of the 'trough' for over a mile, the depth below the surface increasing until in the Daly–Judge the deposits are 1,500 to 1,800 ft. deep. The pitch of the long ore-shoot of the Daly vein is another illustration; the orebody coming to the surface at the Daly shaft pitches west, and in the Daly–West is mined at a depth of 1 600 ft.; the position of the ore being determined by the occurrence of the Ontario quartzite as a wall-rock, together with the west pitch of the lines of intersection of the lode and the tributary verticals. The remarkable vertical range of ore of a uniform mineral composition remains to be considered. Ore comes to the surface in the Daly–Judge property at an elevation, 2,200 ft. above the top of the Ontario quartzite. It is estimated that erosion has removed 700 ft. of quartzite at shaft No. 3 of the Ontario mine, so that the ore on the 2,000-ft. level is situated 2,700 ft. below the top of the quartzite formation. This gives, in a length of less than four miles, a vertical range of ore of 4,900 feet; throughout this extent, the ore, while varying locally in the relative proportion of silver, lead and zinc, is substantially of similar mineral character.

The mountain range, or zonal type of block-faulting, is displayed in the region traversed by the Ontario belt, and we have a most interesting example of the inter-relation of outbursts of volcanic energy, with the Basin Range structure, and of the work accomplished by block-faulting in the preparation of the strata to receive the ore and in the formation of the fissure-system.

Buried beneath the Wasatch, where the range crosses the Uinta uplift, are the remains of a still older north-south mountain system which involves pre-Cambrian formations. The feature lines of these great mountain chains controlled the course of the Mineral Belt and the direction of the subordinate fissuring. But in tracing the relation, of the mineral deposits in their genesis, to the growth of the mountain systems in which they occur, we need only to go back to the east-west uplift of the Uinta range. There is manifest in the formation of the fissures and in the generation of the deposits, a unity of plan—a systematic development—which had its beginning with the creation of the Uinta axis and culminated in the expiring volcanic eruption that accompanied the elevation of the Wasatch range and the evolution of its great fault-belt.

†The Daly mine, from a length of less than 1,500 ft. on the vein, produced nearly $10,000,000.

‡See Fig. 2, Page 55, January 27, 1906, MINING AND SCIENTIFIC PRESS.

THE oft-repeated statement that sailing vessels have reached the limit in carrying capacity, and that steamers are gradually forcing the 'wind-jammers' out of the trade, is not borne out by press dispatches from Bremerton, Washington, which tell us of the launching of a sailing ship of 8,000 tons burden, this being the largest of its kind ever constructed.

On Saving Platinum.

Written for the MINING AND SCIENTIFIC PRESS by DENNIS H. STOVALL.

During the past two years the discovery has been made that the old-channel placer deposits of the Pacific coast, contain much platinum as well as gold. This important truth was further demonstrated by Dr. David T. Day, of the United States Geological Survey, in the experiments conducted at the Lewis & Clark Fair this year. But previous to these experiments a few managers of the larger hydraulic mines of southern Oregon and northern California, were at work saving the precious sands from the mass of debris scooped from the sluice-floors at clean-up time. One mine, the Deep Gravel, in the Waldo district, southern Oregon, saved nearly 20 oz. of platinum during 1905. Considering the fact that but 110 oz. of platinum were reported as mined in the United States during 1904, this showing of one mine is exceptional.

The method of saving the platinum adopted by the hydraulic miners, is simplicity itself. The method was first hit upon by Manager Wimer of the Deep Gravel mines, and it will be used this season by nearly all of the placer mines of the coast, the diggings of which comprise old-river channels. Mr. Wimer found that cleaning the gold with a shovel, by scooping it directly from the sluices, and washing it in running water, as has been the custom since the early days of placer mining, meant a loss of all the platinum except the very heaviest particles. Only one-fourth of an ounce was saved where an ounce and three-quarters are saved now.

Miners have long known that the black sand, to which the placer gold closely adheres, contains platinum, and many methods of saving the rare metal have been tried. An attempt to save it by panning in the running water of the sluice, resulted in as great waste as cleaning-up by shovel. Another method was to save the platinum sand by a system of undercurrents attached to the sluices; this was the method introduced by representatives of the Welsbach Gas Mantle Company, which uses platinum in the manufacture of its articles. The company supplied drawings of plans to all miners who desired them, that the saving of the rare metal might be encouraged. The same method was followed by the Waratah Minerals Company. But the undercurrent never became popular with hydraulic miners, because it was not successful. Undercurrents require close attention, and the cleaning of them is tedious, too tedious for the average placer miner, whose whole inclination is toward getting gold; moreover, the required undercurrents were different from those used for saving flour gold.

So, after many experiments and repeated trials of various methods, the only feasible plan is found to be the old-time and simple way of panning in still water. The platinum occurs in thin, flat flakes. Though it is a heavy metal, its atomic weight being 195 2, and its specific gravity 21.5, the thin flakes float easily on running water, and will not settle with the gold. It is therefore impossible to save it by scooping up black sand and gold together, and washing the amalgam free of foreign particles in the sluice.

As stated, the only paying method is by panning the entire mass in still water. A big tub, made for the purpose, is employed. The black sand and gold are scooped from the sluice-floor, after the riffles are lifted and rinsed, with a sharp shovel, and carefully panned over the tub. The amalgam is then freed of the black sand. A part of the platinum spills over the pan during the panning process, but it drops and settles into the tub, instead of being washed away, as would occur were the panning done in the running water of the sluice. By careful work, a great portion is saved during the first panning; that which falls into the tub is panned out later. The residue, which consists of platinum and gold particles, held as an amalgam, is then put in a blow pan and dried, after which the gold and platinum fall apart and are easily separated. The two metals are then put in separate flasks, and are ready for the refinery. Old-channel platinum has the appearance of black powder, with the exception that the flakes have a greater metallic luster than powder grains.

CAPPING A HOISTING ROPE.—A good way to cap a hoisting rope is said to be as follows: First, examine the rope and see that every necessary wire is present; then slip on three bands or hoops made of iron of varying sizes, the smallest going on first and the largest last. Then lap round the rope, at a distance of 9 to 12 in. from the end, some copper or galvanized wire; untwist the rope and cut every alternate strand a little shorter than the rest, so that, by doubling them back, we create the formation of a cone. Over this a tight wrapping with copper wire is necessary, which gives a cone-shape to the end of the winding-rope, largest at the end and uniform all the way up. Upon this the cap is placed, which is first made hot and carefully shaped by the smith, so that it exactly fits the rope. The cap in shape is in the form of a loop with two long ears; when placed in position on the rope end it is hammered down tightly to the prepared cone. Finally, the hoops are driven down tightly into position, and should be equidistant from each other.—*Engineering and Mining Journal.*

The Prospector.

Enquiries sent to this department are answered free of charge, if submitted by subscribers who are not in arrears. The full name and post-office address of the sender must be given, otherwise no answer will be made. Those who are not subscribers must accompany their questions with a fee of $3 for each question. No assays are made.

The rock specimen from Coffee, Cal., is diorite. No quartz is seen in the specimen.

The rock from Cecilville, Siskiyou county, California, marked K. S., is a greatly altered diorite. It contains pyrite, epidote and calcite.

The fossiliferous rocks from Eagle mountains, in northwestern Oregon, are sandstone. The fossils are too indistinct to be positively identified, but are probably Cretaceous.

The samples from Independence, Cal., are: No. 1, quartz, probably gold-bearing, and diorite, with a little pyrite; No. 2, much altered granite; No. 3 quartz, with considerable carbonate of lime.

The rocks from Randsburg, Cal., are: No. 1, altered and iron-stained country rock (limestone); it may be gold-bearing. No. 2 is iron-stained calcite (carbonate of lime). No. 3 is felsite, an intrusive dike rock.

The rocks from Happy Camp, Siskiyou county, California, are: No. 1, felsite, an intrusive rock; No. 2, an altered intrusive rock, probably diorite or grano-diorite; No. 3, amphibolite schist. No. 4 is very similar to No. 2.

The ores from Sisson, Cal., are: No. 1, blue quartz containing yellow copper sulphide (chalcopyrite) and bornite (also copper sulphide). No. 2 is quartz containing pyrite; there is also a considerable development of calcite in the rock; it probably is gold-bearing. No. 3 is an admixture of quartz and feldspar; it contains pyrite and may be gold-bearing. There is no evidence that either No. 2 or 3 will contain copper.

The rocks from Pinos, Mexico, are: No. 1, quartz-porphyry; No. 2, vitrophyre (volcanic glass); No. 3, argillite; No. 4, impure limestone. No. 5 has the appearance of a mineralized, eruptive rock. It contains some quartz and much iron oxide. It may be gold-bearing. No. 6 is a volcanic rock, allied to diabase. No. 7 is chert, possibly an alteration of limestone. No. 8 is argillite. No. 9 is limestone. No. 10 is also limestone.

Connection of Survey Officials With Technical Publications.

The following is the order sent by the Director to the members of the United States Geological Survey:

Since the organization of the Geological Survey it has been the policy of the Director not only to permit, but to encourage its members to publish in technical and scientific journals and in the transactions of societies technical and scientific articles, provided they do not anticipate the official publication of the results of specific investigations, of which the priority of publication rests with the Geological Survey. It has always been believed that the widest dissemination possible should be given by this means to information in the possession of the Survey, particularly where the material to be published consists of information gained or conclusions reached as a result of general reading or observation, and is not the outcome of specific official investigations. Even if the writers receive compensation for such articles there does not appear to be anything objectionable in the practice, provided the writing is done outside of official hours.

When such articles are based on information that has been obtained in specific investigations, but (a) is contained in official reports already published or in press, or (b) is not considered appropriate for incorporation in an official report, permission to publish should be obtained from the Director, and the fact should be stated in the article.

There does, however, appear to be some question in respect to the propriety of Survey officials being identified as editors or special contributors, or in any other intimate way, with technical or trade papers conducted as business enterprises. Such connection is apt to be used for advertising purposes and is calculated to bring criticism on the Survey organization. It is deemed best, therefore, while not abridging any of the privileges recognized in the preceding paragraphs, to prohibit such connection of Survey officials with the conduct of trade papers.

This prohibition is not intended to apply to connection with journals which are devoted entirely to the dissemination of scientific knowledge and which are not conducted for profit or as business enterprises. Such publications are *Science*, the *National Geographic Magazine*, the *American Chemical Journal*, *Economic Geology*, *Forestry and Irrigation*.

The Miner's Ten Commandments.

I

Thou shalt not slumber late in the morning, but shalt rise ere it is day and break thy fast, for he that goeth late to the mine getteth no candles, causing the transgressor to grope in darkness and the shift-boss to indulge in profanity.

II.

Thou shalt not take up thy position in the center of the cage when descending or ascending the shaft, neither shalt thou appropriate in thy person more room than the law allows, for thou are but of little consequence among a whole cage-load of men, no matter what thou thinkest to the contrary.

III.

Thou shalt not hesitate on the station, or smoke thy pipe and talk politics with the pumpman, for verily the shift-boss might suddenly appear, and heaven help thee if he findeth the chutes empty.

IV.

Thou shalt not mix waste with the ore, neither shalt thou mix ore with the waste, thou nor thy partner, nor the mucker within thy drift, for surely as thou doest these things the mine will stop paying dividends, and thy name will be 'mud' over the length and breadth of the camp.

V.

Thou shalt not eat onions when going on shift, even though they be as cheap as real estate in Clifton, unless thy partner participateth likewise, for that bulbous root exciteth hard feelings in the heart of the total abstainer, and causeth the interior of a mine to be an unpleasant place.

VI.

Thou shalt not address the boss by his Christian name, neither shalt thou contradict him when thou knowest he is lying, but thou shalt meekly say 'Yes' or 'No' to all that he suggests; and laugh when he laughs and keep on laughing when he relateth a story, even though it be older than thy grandmother.

VII.

Thou shalt not steal thy neighbor's mops, nor his picks nor his drills; neither shalt thou carry away on thy person or in thy lunch-basket low-grade ore from the mine, for thou wilt find it will take a lifetime to obtain a mill-run.

VIII.

Thou shalt not have an opinion concerning thy place of work, for thy employer payeth a fat salary to a school-of-mines expert for constructing in his mind bonanzas that don't exist, so thou shalt refrain from theorizing, and concentrate thy efforts on drilling and the blasting of an abundance of powder.

IX.

Thou shalt not, in order to breathe, steal from the drilling machine compressed air intended for drilling purposes. Thou shalt not go on strike lest thou be turned adrift on a cold and cheerless world; neither shalt thou demand thy pay, for the company's directors in the East know not that thou liveth, neither care they a tinker's dam.

X.

Thou shalt work and break ore every day, the Sabbath included, for verily the board of directors aforementioned hath assumed the prerogatives of the Almighty, and if thou refuseth to toil as they dictate thou and thy dog and all that thou possesseth will soon be hitting the trail for Tonopah.—Sam M. Roberts in the *Tribune-Review*.

LOW COST OF DRILLING.—It is the constant aim of the mine operator to reduce the cost of drilling incidental to the extraction of ore and the search for new orebodies. At Cripple Creek the system of working mines by lessees has tended to cheapen operating costs, and good records for economy have frequently been made. John Sharp, the lessee who is operating the Morning Glory of the Work Company, and the Colorado Boss of the Cripple Creek Consolidated Company, furnishes data covering a period from September 20, 1904, to January 17, 1905, during which time there were 1,367 drill-shifts. As shown by his books, during that time the coal bills amounted to $1,183.17. The greatest number of shifts worked in one month was in October, when 492 were employed. The rock hoisted amounted to 7,500 tons during the months of October, November and December, and the coal bills for hoisting amounted to $450, leaving the total coal bill for running the air compressor $733.17, or 53.7 cents per drill-shift. In speaking of this accomplishment in economical operation, Mr. Sharp said: "I think that my record for making air per drill-shift is about as low as it can be made. The machine used was a straight-line compressor with simple steam and compound air cylinders, and was built by the Sullivan Machinery Company of Chicago. It is supposed to operate only ten drills, but often exceeded the rated capacity."

Repairing Broken Cross-Wires.

To repair broken cross-wires in a transit or level, a small bottle of shellac dissolved in alcohol and a cocoon of spider web are needed. The only tools required are a pair of dividers or a six-inch piece of soft wire bent to a U, but if neither is available a forked stick will answer. The dividers, wire or forked stick should have a small piece of beeswax pressed around each end to hold the web. The best cocoons are yellowish-brown, about ¾ in. long. They may usually be found in dead or hollow trees, or under the bark of old stumps. Good ones may often be found under rocks or in old barns or greenhouses. Occasionally single webs, which may be used in an emergency, may be taken from grass or bushes or limbs of trees; these are generally rough and dirty, but some of their defects may be removed by gently rubbing them with a small stick. If a very fine web is needed, it may be secured from a small white cocoon. A good cocoon will furnish enough webs to last for years, and each chief of party should have one packed with the shellac in his instrument-box. The best web obtainable can be secured by making a spider spin one as he falls from the end of a stick. A small spider will probably spin a fine web, and a larger spider, a coarser web; such webs are always smooth and free from dust. If the spider is made to jump from the end of the dividers or forked stick, the web can be wrapped around the ends and so be in position for immediate use.

Take the instrument which needs the new cross wires to a place sheltered from wind and dust. Unscrew and remove the eyepiece-slide without disturbing the object-glass. Take out two opposite capstan-headed screws of the four which hold the cross-wire ring in its cell and loosen the other two. Using the latter as handles, revolve the ring 90° and insert one of the pointed sticks through the end of the telescope tube into a screw-hole, and, while using it as a handle, remove the other screws and take out the ring. Clean the lines of the reticle ring from all old shellac or dirt and lay it on a board or table with the marked side up. Draw some of the web from the cocoon, either with the fingers or with one of the moistened pointed sticks. Keep pulling and working the tangled mass until an inch or two of single web is drawn out. Attach the ends of the web to the dividers, or wire, by winding them around the wax and pressing them in with the fingers, or wind the web around the forked stick, fastening it with shellac. Examine the web for defects by means of a pocket magnifier or the eyepiece from the telescope. If the web is satisfactory in size and quality, moisten it by dipping it in water for a few seconds, or by breathing gently on it a few times. As the wet web lengthens, take up the slack by opening the dividers, or by bending the wire or stick, but do not attempt to stretch the web more than about $\frac{1}{16}$ in. from its original dry length. Place the web (still on its holder) carefully over the reticle, allowing the holder to rest on the table, thus stretching the web slightly, and move it about until it falls exactly in the center of two opposite lines, using a magnifier to insure accuracy. Put a small portion of the liquid shellac over each side of the web about $\frac{1}{16}$ in. from central opening of the reticle and leave undisturbed for three or four minutes, or until the shellac hardens. While the shellac on one web is drying, another can be prepared. After all are set, replace the reticle in the telescope by reversing the method used in removing it. When in place, the cross-wires should be on the side of the rig toward the eyepiece.—E. M. Douglas in *Engineering News*.

ANTIMONY.—This metal is a white, very brittle metal, of laminated or crystalline texture. It fuses at a low temperature and readily vaporizes. It is not used in the pure state, but it forms several valuable alloys and compounds. The most important alloys of antimony are type metal, britannia, pewter, and anti-friction metals. Type metal consists, essentially, of lead and antimony, often with the addition of small quantities of tin and nickel or copper. Britannia is a white metal alloy of antimony with tin, copper and bismuth, and is much used for tableware. Pewter is a similar alloy, but it contains a smaller percentage of antimony than britannia. There are several anti-friction alloys which usually go under the name of babbitt metals. One of these consists of 50 parts of tin to five of antimony and one of bismuth, but other proportions are in use. The addition of antimony to lead hardens it, and the addition of a small quantity of bismuth gives the alloy the property of expanding at the moment of solidification from a molten state, thus producing a perfect cast from a mold. This property is made clever use of in the linotype machine.

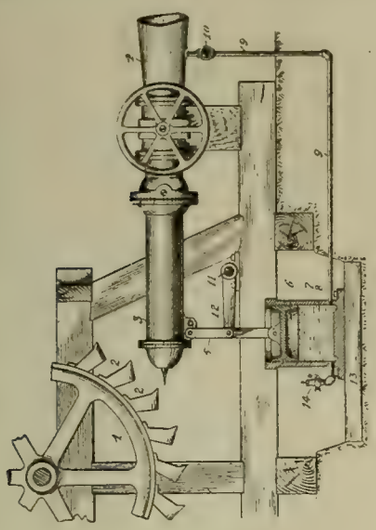
FULLER'S EARTH.—The characteristics of fuller's earth are its variegated color—greenish-white, gray, brown, olive, or olive-green—soft texture and greasy feel. In appearance it resembles clay, and when placed in water will fall into powder, but does not become plastic. The composition varies greatly, chemical analyses of the commercial grades showing a content of 50 to 63% silica, about 10% alumina, from 5 to 10% water, and a fluctuating percentage of iron, calcium, magnesium and other impurities.

Mining and Metallurgical Patents.

PATENTS ISSUED JANUARY 30, 1906.

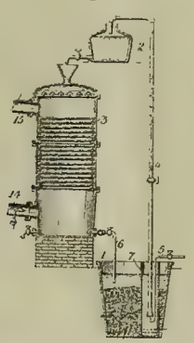
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

HYDRAULIC SUPPORT FOR DEFLECTING NOZZLES.—No. 810,756; G. J. Henry, Jr., San Francisco, California.



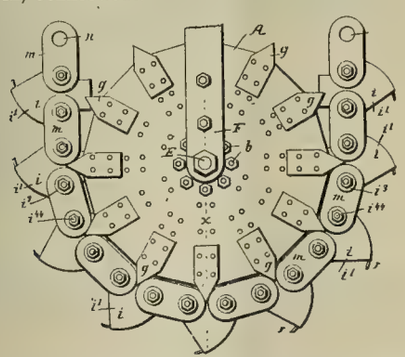
The combination with a deflectable nozzle, of a main pipe to which the same is pivoted, a pressure cylinder, of connection between the cylinder and the main pipe, a piston working within the cylinder, connection between the piston and the nozzle, and means for imparting movement to the nozzle so as to place the stream discharged therefrom in whole or in part onto the buckets of a water-wheel.

APPARATUS FOR PRODUCING COMPOUNDS OF TIN.—No. 810,897; C. E. Acker, Niagara Falls, New York.



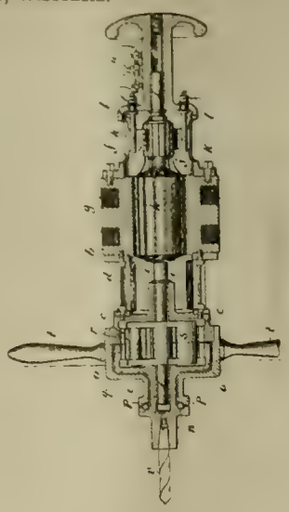
An apparatus for producing chlorin compounds of tin, comprising a dissolving vessel for effecting the solution of tin in a solvent containing chlorin, a reaction-tower, means for circulating the solution through dissolving vessel and reaction-tower, means for producing a gaseous mixture containing chlorin and a diluent in sufficient proportion to prevent undue rise of temperature, and means for delivering mixture to reaction-tower.

CONVEYER-SCOOP.—No. 810,917; W. Crossley, West Haven, Connecticut.



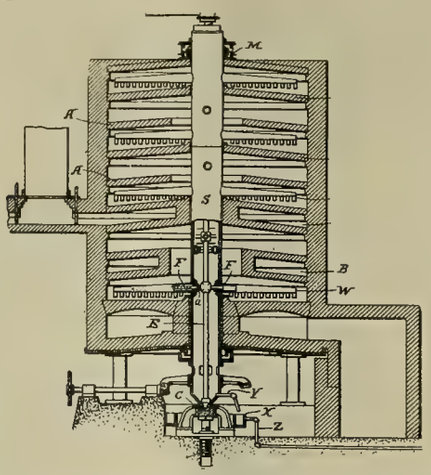
In a dredging machine a conveyer-scoop, comprising in combination a pair of ends or heads, each provided with a pair of flanges around its periphery, forming an intervening groove at right angles to the plane of the head, and a series of longitudinal staves or sections forming the body part or shell of the scoop having their ends secured in the grooves of the heads and connecting the heads.

ELECTRIC DRILL.—No. 810,444; Charles W. Theil, Milwaukee, Wisconsin.



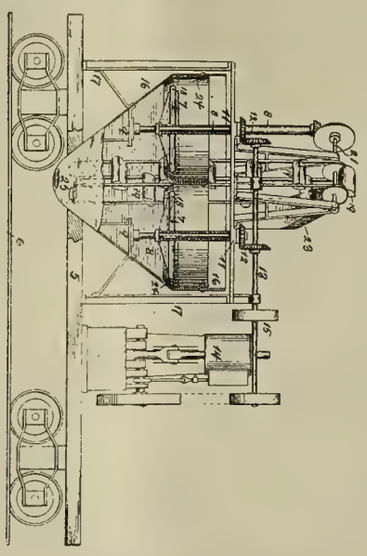
In an electric drill the combination with a suitable case or frame, of a motor-armature and a rotary drill-holder mounted co-axially therein, differential internal gears, fixed one to the drill-holder and the other to frame, and a crank fixed to the armature-shaft and provided with a pinion which meshes with both internal gears, drill-holder being rotatable and the case stationary relatively to each other and the armature-shaft.

ROASTING FURNACE.—No. 809,953; O. Hofmann, Argentine, Kansas.



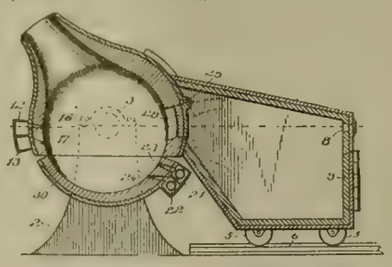
The combination in a roasting furnace, of a pipe, hollow radial arms extending therefrom, and water-supply pipes arranged to deliver water into arms, water-supply pipes being provided with spraying means.

ORE-WASHING PLANT.—No. 810,196; F. Eggers, Cincinnati, Ohio.



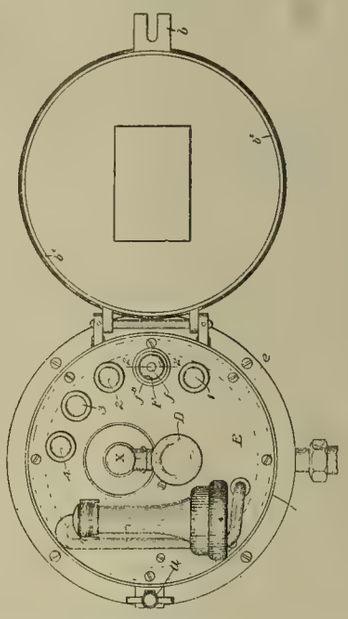
In an ore-washing plant, the combination of a common water tank, a group of circular ore separators arranged therein, means to rotate them and stationary partitions in the upper part of the tank which surround each separator to confine the effect of the operation of the same to the space so surrounded.

CONVERTER.—No. 811,006.—G. T. Walker, Washington, District of Columbia.



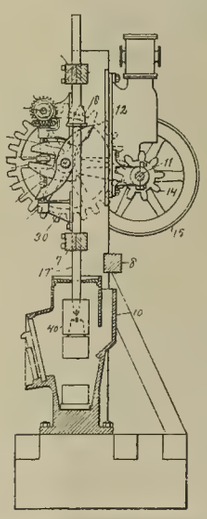
The combination with a converter, of a slag-receptacle associated therewith, slag-receptacle being arranged in close contact with said converter in such manner as to exclude the air from receptacle, means in said converter for agitating the metal, and means for removing the slag and impurities from the metal in the converter into the slag-receptacle.

TELEPHONE FOR MINES.—No. 811,029; A. F. Boardman, Somerville, Massachusetts.



In a telephone, the combination with the case A, its door B and plate E of a telephone receiver C, telephone transmitter X, a mouthpiece D for the transmitter, one or more push-button calls, and a contact maker and breaker F composed of the proper attaching and holding devices and the rod f, spring f', spring contacts f^4, f^4, insulator f^3, holding nut f^5 and contact ring f^6.

STAMP-ACTUATING MECHANISM FOR ORE CRUSHERS.—No. 811,079; W. S. McKinney, Chicago, Illinois.



In a stamp-actuating mechanism, the combination of a main shaft and driving gear thereon, a cam shaft arranged to extend parallel with the main shaft, a gear and cam on cam shaft, latter gear arranged to intermesh with the gear of the main shaft, links pivotally supported concentrically with the main shaft and supporting at their swinging ends the cam shaft, adjusting devices operatively connected with links, and stamp stem provided with a tappet, arranged to reciprocate adjacent to cam shaft.

Mining Summary.

Specially Compiled and Reported for the MINING AND SCIENTIFIC PRESS.

Special Correspondence.

LONDON, February 31.

The annual accounts and reports to June 30, 1905, published last week by the Van Ryn Gold Mines Estate, Ltd., merit the attention of all those interested in Rand mining, whether professionally or as speculators. During the year 221,010 net tons were mined and crushed, yielding gold valued at $1,688,139.50. The recovery was $7.46 per ton. Net profits were $504,579.45, after deduction of all charges on revenue account in South Africa and at London. The working costs amounted to $5.02 per ton, namely, mining and general mine charges $2.64, milling and cyaniding $1.24, general expenses 24c. and development redemption 90c. The charge of sand and slime in the cyanide treatment averaged 3.44 dwt. and the residue 0.81 dwt. A trial was made with a new type of slime machine with a vacuum-separator but it proved unsuitable. From July to September, 1904, 80 stamps were running, the number being increased on the arrival of 1,150 Chinese coolies in October, to 100, and further to 160 in February, by which time the coolies had received preliminary training in their work. The duty per stamp averaged 5.188 tons per day. The mine development during the year amounted to 14,812 ft. at a cost averaging $12.45 per foot. The sinking of the main shaft cost by itself $69.34 per foot, inclusive of pumping and equipment. The ore reserves were increased by 51,300 tons, the total as on June 30 being 437,074 tons. This estimate is based on the arbitrary limit of payability—8 dwt.—and average widths of the main reef leaders, partly at 48 in. and partly at 72 in., with a stoping unit of 36 in. In the past year these widths were exceeded in the stoping by 30%, while the ore developed was of the same grade as in previous years.

The balance sheet shows that the capital of the company—£500,000—is accounted for, in round figures, by the cost of the property (£200,000) and the values left in the balance sheet, after depreciations, of the permanent works, machinery and plant buildings, etc., and cost of labor supply. An amount of $251,521 for development is also left in the balance sheet representing 58c. per ton on the ore reserves at the end of the financial year. The liabilities, including a dividend of £50,000 paid in July, exceeded the liquid assets by about £38,000. No estimate of the net value of the ore reserves is given, but it is to be noted that the consulting engineer, Mr. G. A. Denny, reports the profit per ton milled during the year (after writing off 90c. for development reduction) as $2.67. At the present rate of working the reserves appear to be about two years ahead of the milling capacity. The profits for the six months of the current financial year to December 31 amounted to £68,000, say at the rate of 27% per annum on the nominal capital. The present market price (£2⅜) of the £1 shares would seem to be based on this increased rate of profits rather than on any valuation of the mine which might be made from a study of the foregoing particulars of the net assets of the company, and without taking into account the attitude of the new Government on the labor supply agitation. On the subject of the Chinese coolie question the managing director remarks that one of the heaviest items of excess on original estimates of capital outlay was the "luxurious accommodation" provided for the coolies, to comply with the regulations of the Foreign Labour Department.

The last quarterly report for 1905 issued by Briseis Tin Mines, Ltd., marks substantial progress, the output of black tin having been 321½ tons compared with a total for the previous three quarters of 650¾ tons. The company was formed in November, 1899, with a capital of £600,000, to work deposits in the hills at Derby, Dorset county, Tasmania. The local water-supply having proved inadequate for hydraulicking, races were constructed at a cost of £67,500. The estimated cost of £22,000 for the main or Ringarooma race was greatly exceeded owing to unexpected difficulties, especially at one particular point. This race extends over a line of nearly 30 miles, through a rough and mountainous country with dense bush and forest. It is said to be capable of conveying at least 21,600,000 gal. per 24 hours. The race came into operation early in 1901, but various mishaps occurred up to 1902 which had the effect of delaying the removal of the overburden preparatory to the starting of work on the tin gravel. The overburden was also found to contain more hard material than the estimates provided for, to the extent that in 1903 the boulders of basalt on Briseis hill averaged as much as 12% of the whole overburden removed. In the face of these difficulties it was decided to carry out a plan of working during 1904 by which all energies were directed to the removal of as much of the overburden as would enable the underlying gravel to be worked to the best advantage, only sufficient gravel being sluiced in the meantime to provide revenue for that purpose. The success of this policy is apparent in the more regular working of the mine, coupled with a largely increased output of black tin during 1905. The lower cost of production and the high price of tin during recent months have enabled the directors to declare a first dividend of nine pence per share. The average yield of the gravel treated for the past quarter was nearly 6 lb. black tin per cubic yard, as against 5.49 lb. in 1904. The black tin as dispatched from the mine is about 75% fine.

At the annual meeting of one of the great London banking institutions the other day, the chairman mentioned as a proof of the country's prosperity that a total of £167,000,000 of new capital was issued on the Stock Exchange in 1905, as compared with £123,000,000 in 1904. The summary of mining companies registered in England during 1905, as given in the *Mining Journal*, is as follows: For Great Britain, £3,478,808; Europe, £1,478,000; Asia, £3,133,350; Africa, £15,581,851; North America, £3,274,207; South America, £2,487,375; Australia, New Zealand, etc., £1,993,982; total, £31,427,573. Some degree of nervousness prevails regarding the outlook of the mining industry for the supply of capital in the new year. The financial world is not without apprehension that the screw may be put on by our new political masters, with their overwhelming Radical majority, in ways that may have a tendency to restrict enterprise, or at least to make wealth less remunerative, and thus diminish the spending power of the nation.

SALT LAKE CITY, Feb. 12.

Another new milling plant will go into commission in this State during the present week at the Sevier Consolidated mine, in Piute county, the initial capacity being 100 tons per day. The power plant, water system and mill represent an investment of $250,000. The Sevier property is near the Annie Laurie mine. Gold ores are to be treated under the Godbe process. Seymour W. Tulloch, of Salt Lake City, is president of the company.

There are some big deals being worked out now which affect Bingham and other Utah mining enterprises. During the past two weeks, the air has been permeated with rumors relative to the disposition of Bingham Consolidated. Stories have been coming from the East to the effect that the heavy buying of the stock in the markets of Boston and New York has been for American Smelting interests. Locally, this has not been accepted, for it was not believed those in control of the Bingham company would go into any merger except on a basis that would realize for them a price for the stock far better than had ever been quoted in the markets. The opinion has prevailed in Salt Lake that the Bingham Consolidated Co. would be more likely to follow the plan of the United States Smelting, Refining & Mining Co. and reach out into other fields for custom business. Everyone, apparently, has been at sea and those on the inside have successfully kept their plans secret, so the general public has been guessing as to what is likely to happen. Local officials of the Bingham company profess to know nothing, declaring they knew no reason for the activity of the stock in the Eastern markets. Developments during the past few days leave little doubt in the minds of well-posted mining men in Salt Lake that Bingham Consolidated is being counted on to go into a merger; that it is to be taken in by the gigantic combination of capital which seeks to control the copper and lead smelting business of the country. In this combination, it is believed, are American Smelting interests and Amalgamated. Not only is the Bingham Consolidated to be taken in, but, if the present plans are carried out, practically all the big copper mines of Bingham, except those controlled by the United States Co. This would include the Utah Copper, Boston Consolidated, Yampa and, possibly, the Utah Consolidated.

The statement comes from a reasonably reliable source that if the proposed merger is made, F. Augustus Heinze is to have the general management of the copper mining department. Three of his best experts, A. Franks in charge, are now conducting an examination of the Bingham Consolidated properties, but their movements are being carefully guarded and instructions have been given to everyone in authority to say nothing.

There is one story being circulated to the effect that the properties involved will be taken over in exchange for shares in the big company at various prices, on a fixed basis of measurement of value. The representation in the following is to be:

Amalgamated to be accepted on the basis of $150 a share; Anaconda, $100 for $25 shares; United Copper, $100; Bingham Consolidated, $75 for $50 shares; Utah Copper, $50 for $10 shares; American Smelting, common, at $200; preferred, at $150; Federal Mining & Smelting, at $200; preferred, at $125. United States Lead is also mentioned, but the basis is not stated. It may take several months to work out the combination, but it seems to be almost a certainty that the merger will be made.

The Shawmut Consolidated Copper Co. has installed an air compressor at its Bingham property and has inaugurated systematic development there. The mine is to be opened by means of a tunnel that will cut the ledges from 600 to 1,000 ft. deep. The mill on the property, and which was a failure because it was not provided with the proper machinery, will be remodeled during the year. The Shawmut Co. is also operating the Sedalia mine, near Salida, Colo., and with a small mill is making a profit of $2,500 per month.

During the month of January the mill at the Consolidated Mercur mine at Mercur handled an average of 900 tons of ore per day.

At the annual meeting of the shareholders of the Columbus Consolidated Mining Co. the following were elected: T. Jacobson, president; Clarence K. McCornick, vice-president; S. A. Whitney, secretary and treasurer, who, with W. S. McCornick and Edward R. Hall, the latter a Chicago banker, are directors. The mines are located at Alta. The corporation is out of debt and has $30,000 in its treasury. Some extensive bodies of ore have been developed during the past year. A mill of 125 tons' capacity is in operation.

It is believed that negotiations are still pending which will result in the merger of the Ontario with several other of the principal mines of the Park City district, including the Daly-West and Daly.

Ore shipments from Park City last week aggregated a total of 4,206,840 lb., the shippers and the amounts being: Daly-West, 1,150,000; Keith Kearns, 250,000; Jupiter, 11,000; Daly-Judge, concentrates, 446,000; first-class ore, 436,000; zinc middlings, 297,000. The significance of the foregoing is the record being made by the Daly-Judge, which began operating its mill and shipments of crude ore in the beginning of January. The mine will soon be the heaviest shipper in the camp, it being the intention of the management to close a contract with one of the smelters soon, after which will come an increase in output. Daly-Judge concentrates bring $40 a ton, the crude ore $45 and the zinc middlings $18 per ton, net.

Samuel Newhouse and D. H. Peery, of Salt Lake, have an option on the Ostergard and Mungerson groups of claims at Ely, Nev. M. M. Johnson, of the Newhouse staff, is to conduct an examination.

The property of the Butterfield Mining Co. at Bingham is being subjected to examination for an Eastern syndicate. So is the Silver Shield mine, also in Bingham, and the Carisa, in the Tintic district.

The construction of the new Garfield smelting plant at the south end of the Great Salt lake, by the American Smelters Securities Co., is progressing. Superintendent B. H. Bennetts says the first unit will be ready for commission the latter part of April.

The work of constructing the new Garfield mill of the Utah Copper Co. is progressing. Contractors are busy on the concrete foundations and office and warehouse buildings. For the main buildings the contract for steel structural material was let some time ago. No awards have been made, as yet, for mill equipment.

CALUMET, February 10.

The Lake Superior copper mines started the new year by producing approximately 19,000,000 lb. of refined metal in January. This is somewhat in excess of the average monthly production for 1905. At 18½c. per lb., which was about the average selling price of last month's production, the January yield was worth $3,515,000. While it is not likely that February will witness any important gain in the copper production of Michigan, the yield will be maintained, notwithstanding the shortness of the month. In March a good increase may be expected, as several different mines are increasing their facilities and planning to make a larger production. The Michigan mine, in Ontonagon county, produced slightly less than 200 tons of mineral last month. This is the largest output of any mine in that section for the same length of time. The Michigan is securing excellent results on the present market and is earning a fair profit. About 40% of its output last month was secured in the form of mass and barrel copper, which forms a large proportion of the mine's yield. The rock shipped to the Mass mill, on Keweenaw bay, and treated in that plant, averaged about 20 lb. mineral per ton stamped. As the Mass Consolidated Co. will require the use of its entire stamp-mill capacity within six months, it is expected that the Michigan will shortly begin preparations for erecting a mill for its own exclusive use. It owns a site adjoining the Mass mill, and also one in Ontonagon county. The former is more likely to be used, and an assessment will be required to provide funds for the erection of the building. The Adventure Consolidated, another Ontonagon county property, exceeded its former record, and produced more copper last month than in any previous month since it started work. The increase was secured mainly through the improvement in grade, the increase in the volume of shipments being slight. The Adventure's greatest promise is in its new shaft, No. 4, on the eastern portion of the property, where a lode well charged with copper is opened at the second level. If results at this shaft continue good, it is likely that railroad facilities will be provided.

Tamarack production suffered last month owing to the fire in No. 2 shaft, and the consequent suspension of work in that opening and No. 1 and 5 shafts. No. 3 shaft continued production, shipping more rock than usual. It is now a settled fact that the fire in the Tamarack is out. All that remains to be done before resuming work is to clear the workings underground of noxious gases. A large fan has been installed at the mouth of No. 1 shaft to facilitate the work of ventilation. Pumpmen have been able to descend 600 ft. in No. 2 shaft and adjust the pumps on the third level. In No. 5 shaft a large bailer is in use and the pumps are also in operation, the water having risen 200 ft. in the shaft while work was suspended. It is uncertain when the Tamarack will be able to resume work on a normal basis. Until the air is purified no attempt will be made to send miners underground. No estimate of the damage caused by the fire can be formed before that time. The Tamarack was making an excellent record just before the fire occurred, its rock shipments running between 2,800 and 3,500 tons daily. The Osceola amygdaloid has been furnishing a creditable yield. This bed is reached by crosscuts from the conglomerate workings at No. 1 shaft. Franklin produced 535,000 lb. refined copper in January, more than in any previous month in its history. The Franklin's gain was secured mainly through the improved character of the ground opened in the bottom of No. 1 shaft, at its Junior branch. At the twentieth level, in that shaft, the conglomerate is rich; the lode has been drifted upon 650 ft., and the rock is uniformly well charged with copper throughout. It is expected that No. 2 shaft, to the south, will run into similar ground when it reaches the same depth. A continuance of present results will enable the Franklin to make in excess of 6,000,000 lb. copper during the current year. At the Mohawk results show an improvement over those of the same period last year. The rock is yielding better. No. 1 shaft is opening good ground at its present depth, as is also No. 5. Preparations have been started for the compounding of the second head in the mill on Traverse bay. The stamp-mill contains four heads, all that the original plans called for. The last head to be installed is of compound type. With the second head compounded, the re-construction of the mill will be half completed. At an additional depth of 50 ft. the Isle Royale Co. will start drifting upon the Baltic amygdaloid bed from the new shaft. Sinking has now reached a depth of nearly 100 ft. While the rock is not mineralized, the lode is well defined.

ALASKA.

The steamer Leelanaw, from the Treadwell mines, on Douglas Island, has arrived at Tacoma, with 1,300 tons of ore for the Tacoma smelter, being the fourth Alaska ore shipment to reach Tacoma this year.

ARIZONA.

Mohave County.

T. Ewing, of the Vivian mine, near Gold roads, in San Francisco district, states that the company's new mill has begun operations.——The shaft at the Samoan mine at Chloride is sinking with air drills just installed.

Pima County.

The Helvetia has struck ore at the 800-ft. level after

drifting 250 ft. Operations are being carried on on a large scale at Helvetia, and miners are being added to the force.

Gila County.

The Iron Cap Mining Co., at Globe, has decided to develop their claims which adjoin the properties of the Arizona Commercial and Globe & Arizona Development companies, and the Bird group, which is under bond to H. A. Smith and H. B. Hoveland. M. J. Galpin, a director of the Iron Cap Co., will superintend the work, for which the company has $50,000 available. The shaft, now down 130 ft., will be sunk to 600 ft. and levels run.

J. C. Erman, superintendent of the Live Oak mine, near Globe, has returns from eight cars of ore shipped to the El Paso smelter, showing an average value of 13.60% copper. Shipments now reach nearly 100 tons a day.

Pinal County.

(Special Correspondence).—Mining in Mineral Hill district is becoming active.——C. M. Schofield has twenty men repairing roads and making other preparations for development on the Newburg group.——Mr. Champie has men doing assessment work on the Garrison group.——A. J. Schofield took men from Florence this week to begin the development of the Charlie Smith properties.——At the Alta Mining Co.'s camp several buildings have been completed and a townsite surveyed, and development of the claims is being pushed. This is one of the most promising mineral sections in the county.——The Guild Bros., who have a bond on the Maxfield Copper group, in the Owl Head district, are cleaning out the old workings and uncovering the old ore bodies, which yielded a large amount of high-grade ore. Frank Maxfield, owner of the property, has worked the property for twenty years in a small way and shipping the rich ore.——Alex. Sears has discovered a gold-bearing copper ledge in the Box Canyon district, and has begun development.——The San Fernando Mining Co., a California organization, has completed annual assessment work on its gold properties in Willow Springs district.——Wm. Dougherty has completed the annual work on the Chamberlain gold group, also near Willow Springs.

Phœnix, Feb. 12.

Yavapai County.

C. W. Platt, of the Monarch Co., reports that a reduction plant, including a mill, crusher and three tables, has been ordered for the mine at Wickenburg.——At the Apache-Panther mine, near Crown King, a station is being cut in the main tunnel, from which a winze will be sunk. A compressor has been ordered.——A new gasoline hoist has been installed on the new shaft at the Gray Eagle mine, near Crown King.——The Button mine at Crown King is being unwatered.——Geo. O. Ford has ordered a boiler, hoist, blower and a pump for the Ford mines, near Jerome Junction in the Mineral Point section. He states that sinking will be resumed at once, and that contracts have been let for cord wood and lumber.

James Douglas has recently examined the workings in the Senator mine, owned by Phelps, Dodge & Co. Superintendent Pickerell says the Ten-spot shaft is now being sunk to meet the raise from the Senator tunnel.

C. W. Platt has struck a nine-foot vein of gold ore averaging $14.50 per ton, also a vein of copper sulphide, in the Monarch Company's property, near Wickenburg. Fifteen men are employed.

The Monica mine has been bought by Morgan Tillinghast of Philadelphia for an Eastern syndicate in which he is interested. This group of 13 claims is 17 miles from Kirkland and seven miles northeast of Congress. Development has been pushed steadily, 2,000 ft. of work has been done and a large amount of ore is said to be blocked out. Heavier machinery and power drills will be put in.

John Lawler is at his mines at Hillside looking after work on the Hillside group.

CALIFORNIA.

Amador County.

The new lift pump at the South Eureka mine was put in operation this week after six months of preparation. The pump is installed at the 2,030-ft. level and lifts the water a vertical distance of 1,875 ft. The pump is operated by a 150-h. p. electric motor, and will be used to drain the South Eureka and the Central Eureka mines.

Mono County.

J. N. Kelly, Fred Pheifer and George Denham, of the Rio del Monte mine, near Bodie, who have been driving a tunnel, report having cut the main ledge last week.

The True Friend group of mines, near Masonic, are reported bonded to Salt Lake men represented at Masonic by T. V. Whitelaw.

The Mount Beatty Gold Mining & Milling Co. is preparing to sink a shaft at the Spotted Tiger mine, near Aurora. —— Hansen Bros., lessees of the Live Yankee mine, near Bodie, finished a raise last week and are now drifting on the ledge.

Nevada County.

The New York-Grass Valley mine is to be equipped with a cyanide plant.

A large pump at the Iron Clad mine, near Grass Valley, dropped to the bottom of the shaft owing to the breaking of a cable a few days ago, and now lies under 180 ft. of water. A duplicate pump has been ordered. —— The owners of the Ethel mine, near Grass Valley, are opening up the Baltic, which adjoins the Ethel, by driving tunnels from either end of the claim.

Placer County.

The Alverstone Copper & Gold Mining Co. has leased the R. P. Patterson mine, near Placerville, and has let a contract to run a tunnel 150 feet.

Sacramento County.

The crushing of the timbers at the Blue Ravine mine, near Folsom, caused an extensive cave under the oil tank, and work is suspended until the damage is repaired.

San Bernardino County.

Lyman Stewart, J. S. Torrance, F. A. Galbreath, S. J. Merrill, W. S. Staate, Giles Kellogg and C. E. Iredell have filed locations covering over 4,000 acres of land in this county, supposed to contain iron-ore deposits.

San Diego County.

General Manager G. H. Clarke, of the Cuyamaca Ranch & Mining Co., is preparing to enlarge the company's mill at Cuyamaca by the addition of 10 stamps.

Shasta County.

C. Gilzean, of Redding, C. Fox, of French Gulch, and others have bought the Washington mine at French Gulch.——The Mammoth Copper Co. is shipping matte to Bingham Junction, Utah, in new form. The matte is run into slag pots, after which it is broken into fragments weighing about 200 lb. each. Heretofore it has been shipped in ingots weighing 15 to 20 lb. —— The Sugar Loaf copper mine, near Kennet, is being opened up. —— The Mountain Monarch Co. is about to erect a large plant on the Colorado group, west of Shasta.

Superintendent S. E. Bretherton, of the Great Western Gold Mining Co., has engaged 12 eight-horse teams to haul matte from the Afterthought mine to the Terry Railroad. —— Joseph Holbrook is erecting an impounding dam on the Engels claim on Dry creek, near Igo.

Sierra County.

The Blue Gravel mine at Alleghany is being opened up by M. Walling. The main tunnel is being repaired.

W. W. Miller, of Berkeley, is now at American hill opening up the Johnson gravel mine, which has not been operated for over 30 years.

Siskiyou County.

The Blue Gravel mine, near Yreka, is to be equipped with pumping and hoisting machinery. The ground is to be drifted, and the gravel washed on the surface with water pumped from the mine. H. A. Corliss is manager.

The 10-stamp mill on the Hazel mine, near Hornbrook, has begun crushing.

M. Schuler, superintendent of the Ethel Lynn mine, on Horse creek, near Yreka, began piping a few days ago. The company's main ditch is now delivering 800 in. of water under a pressure of 280 feet.

Solano County.

The Solano County Miners' Association have organized at Vallejo, with P. B. Lynch as president and J. Chettle temporary secretary. The meeting was called to order by President Alfred Tregidgo of the California Miners' Association for the purpose of getting the business men of the city interested in the projected Government reclamation work in the Sacramento Valley, by means of which it is hoped to open up hydraulic mines in the American and Feather river districts.

Tehama County.

(Special Correspondence).—The main tunnel of the Basler Copper mine, near Lowrey, 30 miles west of Red Bluff, has been extended to the contact and a vein of copper sulphide cut. This ore is 700 ft. below the iron cap on the surface. Numerous stringers and small bunches of ore had been cut before reaching this orebody, some of which runs 15% copper, with a small amount in gold and silver. The main tunnel is in nearly 1,000 feet.

Lowrey, Feb. 13.

Trinity County.

Mark Manley, manager of the Enterprise Mining Co., has left for Boston to arrange for the equipment of the Union Hill mine, near Weaverville. —— The owners of the Bullychoop mine, at Bullychoop, are now shortening the aerial tramway at the mine.

The owners of the Shafter mine, at Deadwood, have driven the main tunnel 180 ft. since Jan. 1, and have let a contract for a further extension. This tunnel is expected to tap the ore body 1,676 ft. below the upper workings.

Tuolumne County.

J. N. Richards has completed overhauling the boiler, hoist and pump at the Louisiana mine, near Carters, and will begin unwatering the shaft in a few days. —— D. H. Atkins, of Sonora, has transferred his bond on the Oak Hill mine, near Sonora, to C. F. Stocking, of Chicago. The agreement provides for the installation of hoisting machinery, the sinking of a shaft 500 ft., and the opening of drifts. —— W. A. Nevilles has sold to T. W. Patterson, of Fresno, the Columbus mine on Moccasin creek; the Big Oak mine No. 2, near Big Oak Flat; 2½ acres adjoining the Rawhide placer mine; all of the surface ground on the Rawhide No. 2 quartz mine; and 2½ acres adjoining the Stewart property in the same vicinity.—— The owners of the Keltz mine, 10 miles north of Soulsbyville, have contracted with B. K. Mauna to extend the drift 250 ft. —— Three more stamps are to be placed in the mill at the Tapie mine at Rawhide. —— The owners of the Lady Washington and Dead Horse mines, near Carters, are surveying a tunnel to connect the two mines. —— H. J. Dykes is now unwatering the Rising Sun and Senorita, at Arrastraville.

COLORADO.

(Special Correspondence). — The mild winter has made it possible for many of the mining camps of the State to continue work without interruption. In some portions the snow has been heavy, and in those camps where it has been to, or above, the average, work has been interfered with materially, but in a majority of the camps the snowfall and extreme cold is below the average.——The Independent smelter, at Golden, which has been used for treating low-grade ores from Clear Creek, Gilpin and Boulder counties, will be re-opened under new management. There is plenty of ore in the counties named, which the Smelter trust seemingly does not care to handle, but which could be handled at a profit at the Golden plant. The reason for closing down the smelter before was on account of lack of capital. It is reported and also denied that Dr. F. R. Carpenter is to re-open the smelter. Negotiations are pending for the re-opening of the plant by parties with sufficient capital to insure continuous running. Since the closing down of this plant the trust has increased the rate $3 per ton on certain low-grade ore, which rate prohibits the shipping of the ore direct to the smelter.——Many improvements are being made at the different plants of the smelter trust to facilitate the handling of the large amounts of ore now being received.——Work is progressing as rapidly as possible on the overhauling of the old mill at Colorado City, recently purchased by the Golden Cycle Company.

Denver, Feb. 12.

Clear Creek County.

(Special Correspondence).—Mining and mill-men in this locality say that the rates have been raised on certain ores by the smelters, which prohibits the operators from shipping direct to the smelter. As a consequence of the advance several of the mills which have been closed down, or were running but a portion of the time, are now receiving more ore than they are able to handle running full time. The outlook for this district is encouraging.——At the junction of Clear creek and Fall river, the Dover-Billings Mill Co., David Ellis, manager, has erected a new concentrating mill, provided with rolls, jigs, tables and slimer.——Development work is being pushed by the Stanley Mining Co.——The heavy flow of water in the Lucania tunnel has decreased somewhat and work is progressing.——Some work is being done by the Big Five Co. in the Central tunnel. The ore from the Shafter mine is sent through this tunnel to the Hudson mill.——The Shafter Co. is driving to make connection with their shaft from the Central tunnel level. They are drifting on the vein and stoping. The distance yet to drive is about 700 feet.

Idaho Springs, Feb. 8.

The Alpine concentrating mill at Idaho Springs, with a capacity of 100 tons per day, is now running double shifts, with its entire capacity engaged on the treatment of ore from the Addudel mine in Russell gulch, operated by the Taawasa Gold Mining & Cyaniding Co. The equipment of the Alpine mill is particularly adapted to concentration of ore of the Addudel mine, and a satisfactory saving of values has been made on that class of ore.

Lake County.

The production of Leadville mines for January, 1906, is stated to be 79,000 tons. The industry in Leadville district is active and on the increase. Large contracts have been let for manganese ores, and much new ground in old mines is being blocked out.

In South Evans gulch several properties will double their output.——At the New Monarch, development work is being done in the Winnie, Cleveland and Lida, and from the New Monarch and Winnie about 300 tons of ore daily are being sent to the smelter.——The lessees on the Fortune are shipping 50 tons daily of silicious ore from the upper workings, and it is the intention to open the lower levels and extend the drifts into virgin ground to open the large bodies of ore there.——To the east and southeast in the ground of the Battleboro is a body of ore and drifts are being run from the shaft in both directions to open the ore channel. This is a separate shoot from the one at present being worked near the shaft.——The Favorite, Little Ellen and Izard are shipping 25 tons daily of iron and copper sulphide.

Summit County.

(Special Correspondence).—The Jessie mines in Gold Run, two miles northwest of Breckenridge, have been leased to J. T. Hogan, who has formed a company to work the Jessie. The 40-stamp mill is to be repaired. Mr. Hogan is general manager, F. Gilbert superintendent, and D. H. Lawrance, of Breckenridge, consulting engineer. The Jessie mine has over eight miles of underground workings and a record of $2,000,000. It is a gold mine, but in places produces high-grade silver-lead ores. The values are saved by amalgamation and concentration.——The Country Boy mine, on Nigger Hill, 1½ mile from Breckenridge, is being worked under lease by the Lanyon Zinc Co. with H. S. Clark in charge. A body of zinc ore has been opened up by a drift on the vein intersected by the main tunnel. This tunnel is 1,350 ft. long and intersects five other veins. The vein is two feet wide.——The Sallie Barber, another zinc property, near the Country Boy, is producing six cars of high-grade zinc ore per week. It is operated by a Leadville Syndicate.——The Little Sallie Barber adjoining is also making a steady production. A. W. Phillips owns and operates the group.——The Wellington mine is shipping steadily, the last shipment being of zinc ore.——In the Old Union mine high-grade silver-lead ore is coming in in the raises above the main tunnel. A 100-ton shipment of zinc concentrates has been made, and the iron and lead concentrates continue steadily.

Breckenridge, Feb. 12.

Teller County.

The Henry Adney, at Cripple Creek, is operating a 20-ft. vein on the 500 level. The shaft is sinking to the 600-ft. level.——The Gilpin Leasing Co., working the Jerry Johnson on Ironclad hill, is shipping most of the ore coming from the 450-ft. level. The company is prospecting at a depth of 550 ft. The orebody proper at both the 450 and 550 levels is widening, and on the lower level has increased to about three and one-half feet.

F. G. Horner, a miner employed at the Portland, was arrested early in the week as he came off shift, charged with high-grading. Horner is confined in the Victor jail and a deputy sheriff and an officer from Victor are in search of two other men who are alleged to be implicated in thefts of high-grade ore. Horner, the police believe, is the leader of a gang of high-graders.

Good ore has been struck by Heaton & Gorman, lessees, in the southern section of the Granite claim, on the south slope of Battle mountain, in an old shaft. At a depth of 100 ft. a vein was followed. In a short distance a stringer was encountered, which led to a shoot. The body is three to five feet wide and assays $60 per ton.

The committee in charge of the new Cripple Creek drainage tunnel, to unwater the mines to a depth of 1,100 ft. below the present drainage tunnel level, is incorporating. The papers will be filed with the Secretary of State some time during the present month. It is reported that the committee in charge of the tunnel project and of raising the necessary funds has been suc-

cessful and has completed details for the placing of the stock of the Tunnel Company with the various mining companies.——Several new leasing companies have filed articles of incorporation to operate in Cripple Creek district, as follows: The Ironclad Mill Co., with a capitalization of $16,000, to exist for a period of 20 years. The incorporators, who are also the directors of the company for the first year, are F. D. Prettyman, F. C. Whitehouse, B. H. Lein, J. B. Truitt and W. M. Truitt. Chief place of business and main office is Cripple Creek. The company has acquired the smaller of the two mills of the Homestake Co., on Ironclad hill, where it will treat ores from the Ironclad and Magna Charta claims, on which it holds a lease, and at the same time carry on a custom business. The mill is now undergoing repairs and new mill machinery will be added to the plant. The mill will be ready by March 1st. The Union Leasing Co., incorporators R. S. Husted, C. S. Tyler and C. W. Jackson, is capitalized at $40,000. The directors for the first year are C. H. Kittredge, J. D. Husted, J. H. Morse, W. F. Littell and the incorporators named. The company is to operate leases in the Cripple Creek district. Four leases have already been secured in different sections of the camp, the most prominent being on the Fountain Valley claim of the Banner Gold Co., on the west slope of Beacon hill, close to El Paso Consolidated Co.'s mines. A rich strike was made on the Fountain Valley claim in December.

The Mines Leasing Co., incorporators W. L. Jameson, A. Moore Berry and W. H. Person, who, together with W. B. Cannon and W. A. Weber, will form the directorate for the ensuing year, has been organized.

IDAHO.

Blaine County.

The Boyle Mountain Zinc mines, near Hailey, have been closed owing to disagreement between the lessees and the owners.

Boise County.

A carload of machinery is at Emmett for the Whitman Mining Co., at Pearl. The shipment includes an electric motor, compressor, receiver, air-drills, and piping and connections.

Idaho County.

The O. & E. Mining & Milling Co. is driving a long tunnel at Whitebird to cut the main ledge. The tunnel is now in 700 ft.——Work has been resumed on the Blue Jacket mine in the Cook's Corral district, near Whitebird.

Kootenai County.

The Marguerite Mining Co. has let a contract to J. C. Judge, for 50 ft. of tunnel on the Marguerite mine, near Hope.

Nez Perces County.

Jellum & Jones say that they will have a 50-ton mill in operation on their property, near Pierce City, by Sept. 1st. They are now working two shifts on the drifts at the Gold Dollar mine.

Owyhee County.

J. J. Bennet of the Delamar mill, at Delamar, states the re-construction of the mill will be completed before the end of March. Chilean mills have re-placed rolls in the old plant. Cyanide will continue to be employed to a certain extent.

Shoshone County.

The new 250-ton mill of the Hercules mine has been in steady operation since the first of the year, and is turning out concentrates at the rate of about 30 tons a day. The mill feed is composed of about equal quantities of carbonate and low-grade galena ore, the ratio of concentration being eight tons into one. The coarse concentrates average 55% to 60% lead and over 40 oz. of silver to the ton, and the fine concentrates from 40% to 45% in lead and 30 oz. in silver. The mill is so constructed that its capacity can easily be doubled, and this will probably be done during the coming summer. It is connected with the mine by tramways, and will later on be connected with the railway in the same way. A new and larger compressor will also be installed at the mill for the new No. 4 tunnel, now in 1,000 ft. It is to be 4,000 ft. long and will give 750 ft. of new backs.

Owners of the Hercules mine, at Burke, have arranged to build a tramway from the Hercules mill to ore bins on the Northern Pacific Railroad.——Bannister & Co., who last year operated a jigging plant on Canyon creek, in the center of Wallace, are to remove the plant to a site above the Federal mills at Wallace.——The Alma Mining Co. is extending its crosscut at Deadman gulch, near Mullan, to cut the main ledge.

Washington County.

The Iron Springs Consolidated Mining Co. has completed its cyanide plant on Rapid river near Weiser, and will begin operations in April on ores from the Washington, White Rose and Jim Blaine mines.

MICHIGAN.

The estimated output of the Ahmeek for January is 330,000 pounds, an increase of 74,000 pounds over that of the corresponding month of the preceding year; of the Calumet & Hecla, 7,400,000 pounds, an increase of 600,000 pounds; of the Tamarack Mining Co., 900,000 pounds, a decrease of 730,000 pounds; of the Mass Consolidated, 320,000 pounds, a decrease of 10,000 pounds; of the Isle Royale Copper Co., 240,000 pounds, an increase of 10,000 pounds from that of December; the Osceola Mining Co., 2,800,000 pounds, an increase of 300,000 pounds from that of December; of the Champion Mining Co., 2,094,000 pounds, an increase of 380,000 pounds over that of December; and of the Baltic Mining Co., 1,538,000 pounds, a decrease of 102,000 pounds from that of December.

MISSOURI.

Jasper County.

The Crellar & Young mine, on their 80-acre lease at the Four Corners, northwest of Joplin, is proving to be a rich one. They recently sold two carloads of ore and had three left in the bins. They are working at 116 ft. and are cutting a drift at the 130-ft. level. The mill is crushing a ton an hour. The Gouverneur Mining Co., operating on the same lease, has made a strike at a depth of 80 ft.——La Paloma Zinc Co., of Joplin, has filed articles of incorporation, with a capital stock of $10,000.

MONTANA.

Beaverhead County.

John F. Cowan and others are preparing to sink a shaft on the Iron Mountain mine, near Argenta, which they have recently bonded.

Broadwater County.

The Custer Mining Co. of Winston has begun sinking two shafts on its property.——Bert Lanning has completed crosscutting at the Full Moon mine, seven miles southwest of Winston.

Granite County.

The Hope mill, at Phillipsburg, has been hung up indefinitely. It is stated that the old mill is in need of extensive repairs. The old stone walls are said to be unsafe and would fall were they not braced and held together with timber. A number of men have been laid off at the Hope mine, but miners will be kept prospecting new ground. It is reported that ore will be shipped to Butte smelters.

Jefferson County.

J. L. Malm is building a plant at Corbin to treat the zinciferous ores in that district.

Lewis and Clark County.

C. R. Spicer is putting in a 50-ton concentrating plant near Austin, and expects to have it in operation by May 1st.——John Pollander has completed his crosscut tunnel on the Dread Naught.——Skelley, Goudy & McDonald have completed a drain tunnel on their ground in St. Louis gulch, near Austin.——W. Cunningham is sinking a winze on the Kate Roddy mine on Greenhorn gulch, west of Austin.——J. Larson, of Marysville, owner of the tailing dump at Bald Butte, has arranged with A. Constance, of Unionville, to treat the 70,000 tons in the dump by cyanide process. The dump is said to average $2.25 in gold per ton.

Park County.

The mill at the Revenue mine at Jardine has shut down for 40 days for the installation of new machinery.

Silver Bow County.

(Special Correspondence).—The East Butte mines are yielding 100 tons of ore per day, although five shafts are idle, including the Dutton and Geyman, on which extensive repairs and improvements are being made. The mines of the company in operation are worked entirely by leasers. In No. 2, one set of leasers has struck a body of ore that they are sacking in the mine. The ore runs 42% copper, 65 oz. of silver, and some gold to the ton. The concentrator has been remodeled and provided with new machinery. The plant will now save 85% of the mineral, where it could formerly save but 50%. Work will shortly be resumed in the Geyman, which has been repaired and cleaned up. The vein is 60 ft. wide, with six feet of first-class ore.——The findings of Oliver T. Crane, master in chancery for the United States Court, in one of the numerous damage and injunction suits against the Washoe and other smelters at Butte and Anaconda, is one of importance to mining and smelting companies, as it practically establishes a rule against injunctions to prevent the operation of smelters. The farmers of Deer Lodge valley have combined in suits against the smelters, and for several years the industry of 'settling with the company' has been more important to the ranchers and stockmen than raising crops or cattle. They claim that their lands have been damaged by acids, etc., discharged into the irrigating streams by the smelters, and that their live stock has been killed by the same poison and by smelter fumes. Judge Crane finds that the smelters and mines were here long before the ranchers were, and that the damage being done agriculture is insignificant when compared with the damage that would be done by closing the mines and smelters, which represent more than one hundred million dollars of property and invested capital, and furnishes employment and support for 20,000 men, and indirectly many thousands more, besides being the sole support of the cities of Butte, Anaconda, Belt and other communities. Judge Crane finds that the rancher in whose case the findings were made was damaged, but that the companies responsible for it are solvent and able to respond in damages for all injuries that have been done or may be done in the future.——The Calumet & Butte Co., organized in Michigan by Calumet men, has acquired several claims on the east side of the Butte district, near the Pittsburg & Montana Co., and preparations are making to develop the property.——The Gagnon mine of the Trenton Co., one of the Amalgamated sub-companies, has been shut down to re-timber the shaft between the 1,000 and 1,300 levels. The mine will be closed for six weeks. Meanwhile, the Trenton Co. will produce nothing.——The Never Sweat mine of the Anaconda Co., which was shut down for repairs for several months, has resumed operations.

Butte, Feb. 12.

The Raven Copper Co., of Butte, is driving a crosscut from the 1,200-ft. level of the Buffalo toward the Snoozer mine.

W. A. Clark has ordered Manager A. H. Wethey of the Butte Reduction Works at Butte to arrange for the re-building of the concentrator destroyed by fire last week.

NEVADA.

Esmeralda County.

(Special Correspondence).—Fish Lake valley, in and about Dyer, is 25 miles south of Coaldale, a station on the Tonopah Railroad. Considerable work is in progress, and there are many good-looking prospects, with ledges three to five feet wide, running from $10 to $25 per ton. The Lookout is the principal mine thus far. It is equipped with a 25-h. p. steam hoist and working 20 men. The company has lately placed a contract for a 10-stamp mill, pumping and cyanide plant.——Adjoining the Lookout, the Esmeralda has recently been bonded. They have a shaft down 100 ft., showing good ore. Last week float was found which gave assays from $150 to $256 per ton. Efforts are being made to find the ledge. —— There is an assay office seven miles south of Dyer, at McAfee ranch.

Dyer, Feb. 12.

W. P. O'Meara and others, who recently secured the Valcalda property at Silver Peak, are arranging to purchase machinery for a 10-stamp mill in San Francisco. Power will be secured on Bishop creek in Inyo county, California.

Suits have been commenced in the district court by the Jumbo Mining Co. against J. McKane and others for $112,000 damages for the condition in which the defendants are alleged to have left the mine at the expiration of their lease a year ago. The claim is made that the mine was left in a dangerous condition.——The Goldfield Mining Co. will put in a 50-h.p. electric hoist.——The Great Bend mine, near Goldfield, has commenced shipping ore, after opening up good sized orebody running about $40 per ton.——It is reported that an 18-in. vein of $100 rock has been found in the Daisy claim of the Black-Butte Extension Co., near Goldfield.——A strike was made last week in a new district, ten miles west of Goldfield and four miles south of Alkali springs, by D. C. Pomery and J. J. Sheridan, who have opened up a ledge there. They staked the Alice and the Snowshoe lodes last fall, and ever since have been prospecting the ground. A ledge three feet wide has been opened up on these claims, but the rock showed no pannings. They are driving a tunnel which will cut the ledge at a depth of 50 ft. Pieces of surface quartz assays show gold at the rate of $200 per ton.

Everett & Dungan have sunk 200 ft. on the Gold Crown mine, near Mina, and have cut into a sulphide zone.——A gasoline hoist for the Griggs-Atwood mine, near Mina, has arrived.——All the equipment for the Vulcan Copper Co. has been purchased by the Blue Light Mining Co., to be installed on the Blue Light mine, near Mina.——The hoist of the Mayflower mine, near Bullfrog, has been shipped from San Francisco.——Loftus & Davis have secured a controlling interest in the Great Bend mine near Goldfield, which will be equipped with gasoline power.——The Highland Boy Mining Co. has bought the Silver Summit lead-silver mine, near Sodaville.——The owners of the La Pauta mines, near Hawthorne, have sunk a shaft 300 ft. and are crosscutting to the vein. A steam hoist is to be installed.

Humboldt County.

L. P. Helmer has sold a half interest in the Mill City and Good Hope claims, at Mill City, to E. M. Schaad of San Francisco. The company is putting in a pump and engine and is laying tracks. A mill will be built later.

Lincoln County.

Mr. Lloyd, at Modena, has let a contract for freighting 50,000 tons of mine timbers to Pioche, Nev., via Modena, and for loading back to Modena with ore at one-half cent per pound.——C. B. Sibert, of Caliente, is figuring on a mill for the reduction of free-gold ores at Caliente, and plans to begin operations by the first of June.

Nye County.

The Ridge & Curtis mines, at Gold Crater, are reported sold to the Nevada-Crater Gold Mines Co. for $55,000. A 50-ton shipment was recently made to the Goldfield mill which is reported to have netted $40 per ton.

The Golden Sceptre is sinking a shaft on ledge No. 2, an extension of Gibraltar ledge No. 2. The talc streak, which was struck in the shaft at 15 ft. depth, is six inches wide and assays well. The rest of the shaft is in quartz which pans. Fifteen men are working two shifts on both the upper and lower tunnels.——At the Valley View group of the Gold Center Mining & Development Co., north of the Pioneer, a ledge between well-defined walls has been discovered crossing from the Zu-Zu claim, on which a shaft will be sunk.——The Tramp No. 1 and Tramp Extension, on the south slope of Bonanza, owned by Oddie, Aldrich and others, is being developed by Superintendent Lester. The shaft is down 38 ft. and the tunnel has been driven 30 ft. Good values are found in the shaft. The tunnel was started on a large body of ore.——The strike on the Aurora of the Bullfrog Mining Co., 10 miles north of Bullfrog, is reported to be improving. It is important, as it extends the known mineral area of the district. The ledge on the Aurora on the surface is said to be 56 ft. wide. It is traced for 3,000 ft. on the company's ground and continues on other property. Surface values averaged a little better than $4. The orebody has been cut in the tunnel, which is in 155 ft., at a depth of 70 ft. The first assay went $381, when the ledge was intersected at the hanging wall. The average across the first four feet went $38.45 to $88.——The Mayflower shaft is down 100 ft. and crosscutting has been commenced. The average across the bottom of the shaft runs $30 per ton gold and a small amount of silver. At a depth of 40 ft., where the ledge was found to be over 10 ft. wide, the average was $30 per ton. On the foot-wall talc showing free gold was found. A 25-h. p. hoist will be put in.——The big Eclipse tunnel is in 415 ft., and will reach the ledge by 200 ft. additional driving. The tunnel is cutting a dike of rhyolite, which contains low-grade ore. The rock is very hard, and only two feet of work are being accomplished with three shifts.

The Goldyke Reef Mining Co. is putting in a 10-stamp mill for its mine at the new town of Goldyke, near Tonopah. The owners of the mine are now crosscutting and drifting.——The North Tonopah Mining Co. is sinking a shaft on its ground near the new town of Manhattan.

Ormsby County.

The Selby group of claims in the Jumbo district, six miles north of Carson, is to be equipped with a mill.

NEW MEXICO.

Grant County.

Unwatering of the North American mine at Lordsburg has been completed and sinking resumed to reach a depth of 500 ft.——The Bonney Company has closed

down the Bonney mine near Lordsburg, owing to unsafe condition of the hoist at the main shaft. A new hoist is to be installed.——The International Gold Mining & Milling Company has suspended work.

A rich strike of copper ore is reported seven miles west of Lordsburg by two cattlemen. Two months ago V. P. Harrington purchased from J. Robinson a ranch. Harrington's brother, J. L. Harrington, in rambling over it, noticed a ledge of rock that looked ore bearing. After going down 12 ft. on what they presumed to be a vein, a sample across the ledge carried 41% of copper. They located 10 claims and will begin development work. The vein is two feet wide at the surface and at the depth of 12 ft. is 40 in. wide. The property is one mile from the Southern Pacific.

A cave-in of a hill of slag at the Comanche smelter at Silver City buried the briquetting plant of the company and damaged the machinery, which has delayed the blowing in of the new 250-ton furnace. This company will put in three additional boilers and an electric generating plant.——W. R. Jackson will build a 50-ton concentrator on his claims, near Silver City.

Lincoln County.

An 80-h. p. steam hoist and an air compressor will be installed at the Honey Bee copper mine at Jacarilla by E. Fox, the new owner, who will also contract for 300 ft. of development work on the Hawkeye mine, in the same locality.

Otero County.

The owners of the Monte Carlo group, at Jarilla, have let a contract to sink a new shaft.

Rio Arriba County.

Work has been resumed on the shaft of the Minneapolis mine at Bromide.——R. Cole is sinking to the 300 level on the Sardine mine at Bromide.

Sierra County.

A 40-h. p. gasoline traction engine and a number of dump cars have been received by the Sierra Consolidated Gold Mining & Milling Co., near Lake Valley.——The three-compartment shafts at the Snake mine, near Hillsboro, now down 180 ft., is being equipped with pumps.——A 40-h. p. gasoline engine and hoist have been ordered for the Opportunity mine, at Osceola, near Lake Valley. The company will erect a 250-ton stamp mill.

Socorro County.

The Graphic Mining Co., operating the Graphic mine, near Kelly, is preparing to drive the main tunnel, now in 1,200 ft., 800 ft. further.

Taos County.

A 300-foot tramway is being laid at the Stella mine, near Red river.——Kelly Bros. have cut the lead at the Blue Rock mine, near Red river, after running a tunnel 100 feet.

OREGON.

Baker County.

Manager McCarthy, of the Golconda mine at La Grande, is remodeling the mill at the mine, installing new concentrators, and adding an automatic sizer. Two 500-ton ore bins are being built, replacing the 60-ton bins.——The owners of the Ophir mine have decided to install a hydro-electric power plant at Baldy Lake to furnish light and power for the Ophir, Sheridan and other mines at Cable Cave, 15 miles from Sumpter.——Manager G. W. Boggs, of the Mayflower mine, in Cornucopia district, 60 miles east of Baker City, is completing his cyanide plant. Sixty thousand feet of lumber have been taken in over the snow.

M. A. Dehuff, manager of the Dames Mining & Milling Co., reports that a 20-stamp mill will be installed on the company's property at Greenhorn in the spring.

L. V. Swiggett, manager of the Golden Chariot group, in the Bear Creek district, two miles east of Sumpter, has returned from the East and says development will be resumed as soon as machinery is received. A three-drill compressor will be put in, as well as extra buckets and cables. The main shaft is sunk to 200 feet.

Grant County.

The roof of the stamp mill at the Equity mine, near Comer, collapsed last week, owing to the weight of snow that had accumulated on it.

Josephine County.

The Briggs Gold Bar Mining Co., owning property on the California line, near Grants Pass, have purchased machinery for a 20-ton mill. A sawmill is en route to the mine. The principal tunnel of the mine is in 200 ft. and drifts are being run.——L. B. Wickersham, superintendent of the Granite Hill mines, at Grants Pass, reports that the conversion of the machinery from a steam to an electrically operated plant has been completed.

Contracts have been let for the further extension of the lower tunnel, at the Mountain Lion mine, at Davidson.

Union County.

The management of the Indiana mine, at Medical Springs, say that crushing, concentrating and smelting machinery to treat 100 tons daily will be installed in the early summer.

SOUTH DAKOTA.

Pennington County.

The American Tungsten Co., owning claims near Hill City, are considering the building of a concentrating plant to treat ores carrying wolframite and tinstone.

The Montezuma Mining Co. at Rochford is preparing to operate its property. The company patented part of its ground, and surveyors are platting five more claims preparatory to patenting them. The company has installed an air compressor and two drills.——Operations are to be commenced on the old Standby, near Rochford. Men are repairing and putting a new roof on the mill and fixing the flume.

The Golden West mill, six miles west of Rochford, will be increased in capacity, according to Manager E. J. Kennedy, who says that all details have not yet been arranged. The Golden West is a low-grade mine. Last year 10,000 tons of ore were handled, the season being limited, as the mill is operated by water power.

UTAH.

Juab County.

F. W. Sherman, superintendent of the Daly-West mill at Park City, will instal his ore-dressing devices in the mill to be built by the Yankee Consolidated Mining Co. in the Tintic district. He will also have charge of the construction of the plant.

Manager G. H. Dern, of the Mercur Consolidated, in Camp Floyd district, says the average put through the mill in January was 900 tons per day. Development has been carried along vigorously and satisfactorily. In what is known as raise 80 a large body of ore has been opened and, for over 100 ft. that has been drifted, shows an average width of 20 ft. In raise 174, another body of ore has been opened, from 8 to 15 ft. wide. The vein was cut 500 ft. deeper than where it was exposed in the old workings.

Salt Lake County.

The Red Wing and Butler-Liberal, recently taken over by the former together with the Utah-Apex, will form another combination of Bingham properties. W. C. Orem is perfecting the local arrangements for this change in affairs.

Farmers in the vicinity of Sandy, among whom is John W. Mackay, of Taylorsville, have filed additional suits against the Utah Consolidated, United States and Bingham Copper & Gold Mining companies for damages to the amount of $30,572.82 resulting from smelter fumes.

Summit County.

J. E. Bamberger, president of the Daly West Co., says of the reported Daly West-Ontario sale that there is no foundation for the report that an option had been secured.

In sinking at the St. Louis-Magnolia property, near Park City, Wednesday, at a depth of five feet, a streak of high-grade galena ore was encountered.

Manager Oscar Lawrence of the Jupiter states that there is enough ore in sight to insure shipments for some time to come. In the spring the working force will be increased and mining on a larger scale commenced.

WASHINGTON.

Chelan County.

The Wenatchee Gold Mining Co. will extend its tunnel, six miles from Entiat, several hundred feet to the main vein.

Ferry County.

(Special Correspondence). — The Belcher Mountain Railway Co. has arranged to remove the rolling stock for its road and machinery for the Belcher mine to the company's own track and to the Belcher mine. —— In the Copper Key mine, on No. 2 tunnel level, drifts are being steadily driven north and south on the vein. A raise of 20 ft. is in ore. On this level another raise of 22 ft. has not reached the vein. Teams have been engaged to haul ore.——At the Ben Hur additional power drills have been put in the past week on the 300-ft. level. The week's shipments have not exceeded 15 tons of ore a day.

The new machinery at the Pearl Consolidated mine is being installed. A crosscut has been driven to the vein west on the level 100 ft. below the adit, which has struck ore. The east drift on the vein is in 100 ft. and the ore is improving in quality. Eighteen men are employed. ——An improvement has been noted the past week at the Phil Sheridan, at Sheridan camp.——The tunnel at the Hawkeye is in 269 ft. and is expected to strike the vein in a few days. This property is north of Lambert creek.——Ore is being sacked for shipment at the Mountain Boy, at Park City, reported to carry 1,000 oz. of silver to the ton.

Republic, Feb. 9.

The electric drills on the Belcher mine, near Republic, are in operation.——The machinery for the Minnehaha mine, near Danville, is now being installed.——The shaft on the Ben Hur mine, at Republic, is down 119 ft. and drifts are being driven.——Machine drills are to be installed on the Winnipeg tunnel, in Belcher camp, near Republic, to be operated by electricity.——The Straight Mines Co., operating the Anonymous group, on Belcher mountain, near Republic, are arranging to start a tunnel to cut the ledge at a depth of 600 ft. as soon as the snow goes off.

The owners of the Defender mine, at Orient, will sink the shaft, now down 60 ft., to 300 ft.

Kittitas County.

A. S. Randall, secretary of the Skookum Copper Mining Co., of Roslyn, operating property at Cle Elum, states that a plant will be installed at the mine as soon as the roads are open in the spring.

A carload of mining machinery has arrived at Cle Elum for the Helene Mining Co.

Okanogan County.

The Great Northern Mining Co., operating on McKinley Mountain, near Winthrop, on the Methow river, has let a contract for driving a 50-ft. extension of its tunnel, now in 350 ft. Work on the mine will begin March 1.

Snohomish County.

Bids are asked for a 100-ton concentrator, to be installed on the New York-Seattle Copper Mining Company's property at Index. A raise is now being driven from the 330-ft. level to the surface to provide air and to open stoping ground.——The Bunker Hill Mining & Smelting Co. is running a tunnel and opening stopes on the 1,000-ft. level at its mine near Index. A half-mile flume connecting the concentrator with the Great Northern Railway has been completed.——The Buckeye Copper Co. has arranged for machine drills on the 900-ft. level of its mine near Index.——Rowland & McAllister, operating the Ethel mine, near Index, are running to raise from the lower to the middle tunnel.

FOREIGN.

CANADA.

BRITISH COLUMBIA.

At a meeting of the Dundee Mining Co., held recently in Everett, Wash., T. B. Sumner, H. R. Dougless, H. D. Cooley, J. F. Deiericin and W. D. Clark were elected to the board of directors. The company expects to resume operations on the property, located at Nelson.

Boundary District.

The British Columbia Copper Co. has awarded contracts for three blast furnaces for its plant at Greenwood. The new furnaces will be larger than any heretofore used in Canada. In the spring the company will remodel its plant and instal electrical equipment. Electrical equipment will also be put in at the Emma mine, in Summit camp.

MEXICO.

Chihuahua.

The Los Angeles Mining Co., of Los Angeles, in the Guadalupe district of Chihuahua, will build a 10-stamp mill, foundations for which are under way.

Coahuila.

Luis Lyon, of the Cia Minera de Los Santos, reports that heavy rains of the past few weeks have interfered seriously with operations of the company's mines at Villadama.

Durango.

According to W. S. Morse, general manager of the American Smelting & Refining Co., the Velardena smelter was to have been ready for blowing in by April, but owing to the scarcity of labor it will hardly be ready before July. The concentrating mills and plant secured from the Velardena Mining & Smelting Co., under which name they are still known and operated, have been largely increased in capacity. Trams and ore-carriers have been installed and the power plant improved. The new smelter at Velardena will have a capacity of 2,000 tons daily.

El Japon y Annexas, owners of several mines in the vicinity of Guatimape, in this State, have completed sinking a large shaft and are preparing to instal a cyanide plant to treat ores running less than 2 kilos per ton.

Guerrero.

The Garduno Mining Co., of Mexico City, is preparing to work extensive placer claims on the Rio del Oro in this State. The deposits lie between Los Cajones and Zirandero. They will be worked by dredgers and hydraulic lifts.

Saltillo.

The Mazapil Copper Co. reports the arrival of 16 carloads of machinery at its mine, near Saltillo.

Sonora.

A. Menger and C. Cervante, of Tucson, Ariz., have been investigating a discovery recently made 15 miles from Salina Port, on the Gulf of California, and 65 miles northwest from Altar, and have bought the same. The ore is conglomerate. A shaft sunk 50 ft. is all in ore and a crosscut is in ore, some of which is rich, the free gold showing. The ore will be shipped.

Books Received.

'The Copper Deposits of the Clifton-Morenci district, Arizona' is the title of professional paper No. 43, by Waldemar Lindgren. This is one of the most important contributions to geology and economic mining that has been issued during the past year. The author takes up the history, climate, and literature of the district, all of which is interesting, to even the casual reader. Them are described the general geology, the various ore deposits, the metasomatic processes, resulting in ore deposition, characteristics of the deposits, and of the several districts. The subject is treated in a most exhaustive manner, and is profusely illustrated with half-tone engravings, sketches, maps, etc. To those interested in copper mining this treatise, although of but a local district, cannot fail to be of great interest and value. may be obtained by application to the director of the United States Geological Survey, Washington, D. C.

The twenty-sixth annual report of the director of the United States Geological Survey, just received, is a comprehensive presentation of the accomplishments and present condition of this branch of the government service. It is not dissimilar from other similar reports of recent years, though by comparison with the earlier reports, a wide difference is observable. One interesting feature is the insertion of maps showing the progress being made in the preparation of the geological atlas of the United States. Considerable space is also devoted to the hydrographic branch and reclamation projects. The work allotted to the several field parties is reviewed, and results accomplished stated. The survey is divided into several departments for the more economical and satisfactory conduct of the work. These are the administrative, geologic, topographic, hydrographic, and publication branches, and the reclamation service. Those interested in the work of the survey can obtain copies of this report by addressing the director of the United States Geological Survey, Washington, D. C.

The value of a book is determined for the individual by himself, his knowledge and needs being the determining factors. A mining man examining a 'Handbook of Cost Data' by Halbert P. Gillette will be disappointed if he expects many data on the actual costs of the class of work he may be doing. But, if he desires advice as to how to keep cost data, how to decrease his own costs and how to gain more efficient service from labor, he will be well repaid by reading the introductory chapters on costkeeping, preparing estimates and organization of forces. The book details costs for thirteen classes of construction, including earth excavation, rock excavation, roads, stone masonry, concrete, water-works, sewers, piling, buildings, railways, bridges, surveys and

miscellaneous structures. All of these subjects are treated in a little over 500 pages, of which but 35 are devoted to rock excavation, quarrying and crushing. Two-thirds of this is of but little value to the miner. This criticism is not intended to be captious. The book is written for a purpose and it fills that purpose admirably. Contractors and constructing engineers are given a guide for the preparation of estimates that probably has never been equaled. The very dearth of information on the costs of metal mining but emphasizes the demand for a book devoted to that subject alone. It is to be regretted that so few data have been presented as to Western costs which differ from Eastern, because of different conditions of material, transportation and labor. Other sections of the book are more complete. Their arrangement is logical and adpated to quick reference. It gives all possible details of cost and defines the conditions of such cost. Beyond this it shows how to analyze costs and indicates the best methods for economical work. It is published by the Myron C. Clark Publishing Co., 13-21 Park Row, New York, and will be sent postpaid by the MINING AND SCIENTIFIC PRESS for $4.

Personal.

THOS. H. LEGGETT is now in London.

JAS. W. NEILL is at Pasadena, California.

W. B. MILLIKEN, of Denver, is in Nevada.

ALBERT BURCH is examining mines in Utah.

SAMUEL R. PORTER, of Los Angeles, is in Mexico.

NICHOLAS TREWEEK, of Salt Lake, is in New York.

C. S. PAINE, of North San Juan, is in San Francisco.

J. C. NIVIN, of Bellevue, Idaho, is now at the Palace Hotel.

W. F. BLAIR, of Chicago, and a mine owner, is visiting California.

WALTON E. DOWLEN has arrived at Goldfield, Nevada, from Paris.

G. D. B. TURNER has returned to Utah from southern California.

EDWARD D. DOWLEN has left San Francisco and is on his way to London.

LEWIS SEARING, of the Denver Engineering Works Co., is in New York.

WILLIAM B. FISHER has been on a visit to San Francisco, from Wallace, Idaho.

L. J. W. JONES is smelter superintendent of the Tacoma smelter, at Tacoma.

THEO. L. LAMMERS will be in Nevada making mine examinations until March 1.

HENRY McW. BOURKE, who visited California on his way home, is now in London.

HENRY DE C. RICHARDS has been examining mines in Amador county, California.

JOHN BIRKINBINE has been elected president of the Franklin Institute, Philadelphia.

WALTER E. TRENT sailed on the *Sonoma* for Sydney, on his way to Queensland, Australia.

HORACE V. WINCHELL, of Butte, is taking a short rest at the Del Monte Hotel, Monterey.

J. H. RICKARD has been appointed manager for the Djebel Charra Mining Company, in Tunis.

B. H. BENNETTS is superintendent of the big smelter in course of construction at Garfield, Utah.

MARK B. KERR has gone to Tonopah to act as consulting engineer for the West End Mining Company.

F. W. NEWTON is superintendent of the National Mining Company's property at Stein's, New Mexico.

JOHN ROSS, JR., manager of the Wildman Syndicate, has returned to Sutter Creek from San Francisco.

E. J. KENNEDY, superintendent of the Golden West mines, near Rochford, South Dakota, is at Chicago.

WM. WILLIAMS, a pioneer of Wallace, in the Cœur d'Alene, is visiting that district, after a long absence.

E. WILDER, of Kansas City, and J. C. FARRINGTON, of Topeka, have been inspecting mines at Globe, Arizona.

L. W. POWELL has assumed the management of the Calumet & Arizona Company's mines at Bisbee, Arizona.

D'ARCY WEATHERBE, of the editorial staff of the MINING AND SCIENTIFIC PRESS, is now in British Columbia.

J. K. FIRTH has associated himself with the mining machinery department of the Fulton Iron Works, of San Francisco.

MARTIN SCHWERIN, of New York, was in San Francisco on his way from Oregon. He will visit Virginia City before returning home.

EDGAR RICKARD, business manager of the MINING AND SCIENTIFIC PRESS, has started on a visit to Denver, Chicago and New York.

ARTHUR H. HALLORAN, of the editorial staff of the MINING AND SCIENTIFIC PRESS, is visiting the mining centers of Utah and Montana.

JAMES DOUGLAS has been elected an honorary member of the American Institute of Mining Engineers, in recognition of his services to education and to industry.

JOHN T. HARRINGTON is temporarily in charge of the Kearns-Keith mine, near Park City, Utah, during the absence of the superintendent, P. HURLEY, at San Francisco.

J. M. NISSEN, of the Nissen Engineering Company, of Los Angeles, is now in Tepic, Mexico, installing machinery for the Lacy Manufacturing Company, of Los Angeles.

WARNER MILLER, of New York, president of the Dominion Copper Co. (Ltd.) of Phœnix, B. C., and M. M. JOHNSON, of Salt Lake, consulting engineer for the company, are at the mines, guests of T. R. DRUMMOND, resident manager, at Phœnix.

E. E. NICHOLSON was wrongly described as recently foreman of the Granby mines; he occupied that position with the Sunset mine in the Boundary district of British Columbia. Mr. Nicholson is now superintendent of the Carrizo Copper Co. at Autlan, in Jalisco, Mexico.

METALS.

SILVER.—Per oz., Troy: New York, (by wire), bar silver, 66⅜c. per fine ounce; San Francisco, 66⅜c.; London, 30 1/16d. (standard ounce, 925 fine); Mexican dollars, 51@53c., San Francisco; 51c., New York.

COPPER.—New York (by wire, average for week ending Feb. 15), Lake, 17.75@18c.; Electrolytic, 17.62@17.87c.; Casting, 17.50@17.62c. per pound. Mill copper plates, $21.00; bars, 21@24c. London: £78 spot per ton.

LEAD.—New York (by wire, average for week ending Feb. 15), $5.55 per 100 lb; San Francisco, pig, 6.55@6.78c. per lb.; pipe 8@8½c.; sheet, 9@9½c.; London: £15 15s. ℔ long ton.

SPELTER.—New York (by wire, average for week ending Feb. 15), $6.05@6.10 ℔ 100 lb.; London, £25 15s. ℔ ton; San Francisco, ton lots, 7c.; 100-lb lots, 7¾c.

TIN.—New York, pig, $36.40@36.70; bar tin, ℔ lb., 42½c.; pig, 39c. London, £167.

PLATINUM.—San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $20.50 ℔ Troy oz. Platinum ware, 75@$1.00 ℔ gram.

QUICKSILVER.—New York, $40.00@$41.50, large lots; London, £7 7s 6d.; San Francisco, local, $38.00@39.00 ℔ flask of 75 lbs.

NICKEL.—New York, 48@60c ℔ lb.; ton lots, 40@47c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c.; dust, ℔ lb., 10c.; sulphate, ℔ lb., 4c.

BABBITT METAL.—San Francisco, No. 1, 10½c.; No. 2, 8c.; No. 3, 7½c.; extra, 17½c.; genuine, 32½c.; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 23.50c; San Francisco, Plumbers', 100-lb. lots 19.75c.

ALUMINUM.—No. 1, 99%, small lots, 33@37c. ℔ lb.; 100 lbs., 35c.; 1000 lbs., 34c.; ton lots and over, 33c., Pittsburg. No. 2, 90%, small lots, 34c.; ton lots and over, 31c, Pittsburg.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $18.50; gray forge, $17.25; San Francisco, bar, 3½c. ℔ lb., 3¾c. in small quantities.

STEEL.—Bessemer billets, Pittsburg, $26.00 open hearth billets, $27.50; San Francisco, bar, 7c to 13c ℔ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 8½c.; less than 500 lb., per lb., 8½c.; in 25-lb. tin pails, ½c. ℔ lb. above keg price; in 1 and 5-lb. tin cans, 100 lb. per case, ½c. per lb. above keg price. Dry Lead.—In bbl., 1 ton and over, 8c.; do. in kegs, 8½c.

LIME.—Santa Cruz, $1.35 country, $1.25 city ℔ bbl.

CEMENT.—Imported, $3.00@4.00 ℔ bbl.; California, carload lots, $1.80 f. o. b. at works; small lots, $2.10 ℔ bbl. in sacks, 4 sacks to bbl., 5c for each sack returned.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00;shingles, $2.50 for No. 1, and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $1.85; Cut, $1.75. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d, Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4d and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

GENERAL SUPPLIES.

ANTIMONY.—New York, per quality, 14c@15c; San Francisco, 1000-lb. lots, 14c; 300@500-lbs. 12c, 100-lb. lbs. 12c; 100-lbs lots, 13c.

BONE ASH.—Extra No. 1, 6c ℔ lb; No. 1, 5c½.

BORAX.—Concentrated, 9½c ℔ lb; powdered, 10c; fused, 25c; crystal, refined, 8c.

CANDLES.—Standard Oil Co.—Electric light, 16 oz., 11c; 14 oz., 9¾c; 12 oz., 8½c; 14 oz., 7¾c; Hotel, 12 oz., 9c; Granite (mining), 16 oz., 11½@11¾c; 14 oz., 10@10½c; 12 oz., 9½@9½c; 10 oz., 8½c; Paraffines, White, 1s, 2s, 4s, 6s, 10½c; 12s, 11c; colored, 1c higher; Radiant Paraffines, 4s, 6s, 14 oz., 9½@9¾c; 10 oz., 7¾c.

CAPS.—3x, $5.50@6 per 1000; 4x, $6.50@7; 5x, $8@8.50; Lion, $9@9.50, in lots not less than 1000.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3½c ℔ lb.; caustic soda, in drums, 3@3½c ℔ lb.; Cal. s. soda, bbls., $1.10@1.20 ℔ 100 lbs.; sks., 90c@$1.00; chlorate of potash, 12@13c; nitrate of potash, 6¾@7c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2¼@2½c; flour sulphur, French, 2¾@—c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 6½@7c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66° B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

OILS.—Linseed, boiled, bbl., 56c; cs., 61c; raw, bbl., 54c; cs., 59c; Lucol oil, boiled, bbl., 48c; cs., 53c; raw-bbl., 46c; cs., 51c. Kerosene—Pearl, per gal., 17c; Astral, 17c; Star, 17c; Extra Star, 20c; Eocene, 19c; Elaine, 26c; Water White, in bulk, 10½c; Mineral Seal, iron bbls., 18½c; wooden bbls., 21c; cs., 24½c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 15½c, do., cs., 22c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 12½c; do., in cs., 19c; Lard Oil, E. W. S., bbl., 65c; cs., 70c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 53c.; Natural White, 68c; Bleached, do., 57c; Whale Oil, cs., 57c.

BISMUTH.—Subnitrate, ℔ lb., $2.10.

CHROMIUM.—90% and over, ℔ lb., 80c.

FIRE BRICK.—Domestic, carloads ℔ 1000, f. o. b., factory square, $25.00; soap and split, $22.50; arch and wedge, $27.50; skewback, $30.00; circle, $32.00.

FIRE CLAY.—Domestic, ℔ ton 2000 lbs. in 125-lb. bags double, and dry ground, f. o. b., factory, $8.50.

FUSE.—Triple tape, $4.00 per 1000 feet; double tape, $3.55; single tape, $3.10; Hemp, $2.85; Cement No. 2, $3.10; Cement No. 1, $2.75, in lots of 3000 and up.

LITHARGE.—Pure, in 25-lb. bags, 9½@10½c ℔ lb.

MAGNESIUM.—Pure, N. Y., $1.60.

MANGANESE.—Black oxide, ℔ lb., 2¾@4c.

MERCURY.—Bichloride, ℔ lb., 77c.

MOLYBDENUM.—98@99% N. Y., $1.75 ℔ lb.

PHOSPHORUS.—American, ℔ lb., 70c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitroglycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1**, 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2**, 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

RED LEAD.—500 lb. and over at one purchase, ℔ lb., 8½c.; less than 500 lb., 8½c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 54c.

SODIUM.—Metal, ℔ lb., $1.

TUNGSTEN.—Best, ℔ lb., 90c.

URANIUM.—Oxide, ℔ lb., $3.40.

Commercial Paragraphs.

MR. L. F. BOWER has been appointed comptroller of the Allis-Chalmers Co.

THE general offices of the Ludlow-Saylor Wire Co. have been removed to Fourth and Elm Sts., St. Louis.

THE Westinghouse Machine Co. have opened a Philadelphia sales office in Room 1003 North American Building.

CROCKER-WHEELER CO., of Ampere, N. J., report that their business for 1905 was larger than any year in the history of the company.

WM. ROSLINGTON, manager F. W. Braun Co., and R. L. WILLIS, of the Western Candle Co., are making a trip over the Mother Lode.

THE Jeanesville Iron Works report the complete installation of a 2,000-gal-per-min. pump on the 1,000-ft. level of the El Paso Consolidated mine, Cripple Creek.

CARY & FIELDING, 1711 Tremont St., Denver, Colo., state that they have put in a consigned stock of valves manufactured by the Wm. Powell Co., of Cincinnati, Ohio.

THE De Lamar's Copper Refining Co. has bought property at East Chicago and is now erecting a lead refinery, with a capacity of from 2,000 to 3,000 tons per month.

THE General Engineering Company, recently incorporated, with offices in the Dooly block, Salt Lake City, are prepared to test ores in large quantities and advise as to suitable methods and machinery.

THE stock of F. M. Davis in the F. M. Davis Iron Works Co., of Denver, has been purchased by T. S. Cary, R. T. Cary, W. C. Davis and T. M. Blythe, and the company will continue to offer mining, milling and smelting machinery.

Trade Treatises.

Instruction Book No. 5,000 from the Allis-Chalmers Co., of Milwaukee, Wis., tells how to set up and operate Style 'D' Gates rock and ore breaker. Incidentally it illustrates and details the construction.

Under the title of 'Hydro-Electric Plants of the United States, Canada and Mexico,' Arthur W. Clapp, M. E. E. E., 1164 Monadnock Block, Chicago, Ill., will shortly give to the electrical engineering field the first volume of an exhaustive treatment and description of the plants of over 500-h.p. capacity, in the countries covered.

MINING AND SCIENTIFIC PRESS.

Whole No. 2379.—VOLUME XCII. Number 8.

"Science has no enemy save the ignorant."

THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED MAY 24, 1860.

Published Every Saturday at 330 Market Street, San Francisco.

EDITORIAL.

ON November 17, 1855, David Livingstone discovered the Victoria Falls of the Zambesi. Fifty years later a steel cantilever bridge was built over the falls. It was linked on April 1, 1905, and is now almost complete. The trains of the Rhodesian railroad will shortly be able to cross the Zambesi. In September the British Association for the Advancement of Science held a session at the Falls, the president being the son of Charles Darwin. The world moves rapidly, and occasionally to some purpose.

THE reminiscent article on the Comstock will prove interesting, when read in connection with the picture of Virginia City as it looked thirty years ago. It has always been a question whether the Comstock did more good or more harm to mining as a legitimate industry; the wild gambling, trickery and underhand practice of the boom days on the great lode did much to undermine the morality and reputation of mining in the West, and while the enormous output gave fame to the region and wealth to some of its people, it is a question whether, from the standpoint of these days, the good of it outweighed the bad features. One story may be told to illustrate the mingling of humor and rascality that distinguished many of the transactions of that period. The pump-rod at the Combination shaft broke suddenly; one of the men present rushed to town and telegraphed to brokers at San Francisco to sell stock. He returned after 'lunch' and, to his exceeding annoyance, found the pump running. Repairs had been made in two hours; that pump-rod was nearly 3,000 feet long and was made of Oregon pine, 18 inches square, strapped, and bolted with iron. The story balances the greed of one man against the mechanical ingenuity of another.

MINE SUPERINTENDENTS will find interest in the contribution discussing the best shape to make a shaft that is already ten feet square. Mr. R. H. Burrows submits the question in an impartial manner, despite the fact that it formed the basis of an amiable controversy with his directors. Incidentally, we congratulate a mine manager who has directors so reasonable and well-informed. The problem is one worthy of attention and we hope some of our readers will express their views upon it.

CONGRESS has voted, under an urgent deficiency bill, the sum of $25,000 for further experimental work in connection with 'black sands,' with the particular purpose of encouraging the search for platinum. Dr. David T. Day, who has directed this work, at Portland, will also arrange to send a number of young men into the field, but not at Government expense, to test placer sand for platinum, iridium and osmium. Platinum and tin are two metals for which the present demand far outruns the supply.

WHILE tin remains a scarce product of the United States, the domestic tin-plate industry, which involves the application of foreign tin to American iron, is prospering. During 1905 there were 275 mills in operation, turning out over 600,000 tons of plate. In spite of this competition, the similar industry in Wales is also prosperous, having produced 625,000 tons. Notwithstanding the tax placed on tin-plate by the McKinley tariff fifteen years ago, the Welsh mills sell freely to the United States, without spoiling business on this side.

OUR metallurgical friends will be glad to read the article on 'Pyrite Smelting Without Coke' by so practical a smelter-manager as Mr. Lewis T. Wright. It is not so long since, that, in another place, we elicited a vigorous discussion on pyrite smelting. But the subject does not grow stale; the infinite variety of conditions to which it refers gives it a perennial interest. Mine sampling, ore deposition and pyrite smelting are subjects that will continue to be with us, because they deal with basic problems. The pages of the MINING AND SCIENTIFIC PRESS will always be open to the discussion of them.

PRESS despatches have told of an active volcano in Colorado, and irresponsible scribes have appealed successfully to that love of the marvelous which is to be found in every man. Such stories of plutonic activity break out in the daily press at regular intervals. In this case, it is likely that the so-called volcano was an emission of steam from thermal springs, of which there are several at Hot Sulphur Springs, Colorado; and if not that, it may have been the burning of a coal outcrop started by prospectors desirous of testing the mineral in a simple, but very careless, manner. There are numerous seams of bituminous coal in that part of the State.

EVERYONE interested in mining throughout the West will have felt keen interest in the developments announced from Boise and Denver. If the perpetrators of the crimes that have disgraced several mining communities during the last five years—to go no further back—have been caught at last, it will be an event of the first importance. We hope the trial of the suspected men will be conducted fearlessly and fairly, and that if proved guilty their punishment will deter the perpetration of similar atrocities. In the meanwhile, we venture to say that the premature boasting of the superintendent of the Pinkerton agency can only be explained on the supposition that he desires to advertise himself. It is not seemly to talk of the suspects as already condemned by the law, and it is not necessary to brag about former most excellent service in Pennsylvania. The men who assassinated Arthur L. Collins, who instigated the Independence explosion, who led the brutal attack on the Smuggler-Union miners, ought to have been caught and punished long ago: the failure of the authorities to do so has disgraced Colorado in the eyes of all decent people; but let the detection and the punishment be undertaken, not as an incident in the feud between two parties to an industrial quarrel, nor as a private vendetta, but as the due enforcement of justice and the vindication of laws too long outraged.

Ore Flotation.

We publish a comprehensive abstract of a paper read before the Faraday Society, in London, which deals with the concentration of ore by taking advantage of those physical properties which cause minerals to rise to the surface of certain liquids. The article may seem, at first sight, to be abstruse and highly technical, but careful reading will prove that it is written with delightful clearness and it is only highly technical in the sense that it deals with a profound problem in a scholarly manner, free from the needless use of many-syllabled words. At the present time, the idea of separating sulphides from their encasing gangue by causing them to rise in a liquid under chemical action is the basis for several practical processes of ore concentration, especially at Broken Hill, in Australia, where there is an enormous tonnage of low-grade zinc-lead-silver ore, in which blende and galena are so intimately mixed as to defy ordinary milling methods. Messrs. Swinburne and Rudolf have come to the conclusion, after painstaking investigation, that the success of the processes invented by Potter, Delprat and others, as well as the oil concentration process of Elmore, is really due to the adhesion and surface tension arising from what we term capillarity. They explain their argument with admirable skill, employing simple illustrations well within the daily experience of any of us. The 'greasiness' of certain minerals is discussed, and every prospector who uses his pan to investigate his find of ore will find it interesting to read an explanation of a thing he sees so often and has probably failed to explain to himself. Only the other day we received an article in which an experienced miner theorized on the causes that made particles of gold rise to the top of the water in his pan; he noticed that when he let the water run away from the 'colors' of gold and then let it come back slowly, the colors floated and came running toward each other. He imputed it to some sort of magnetism. A vigorous shake of the pan sent the gold to the bottom. This is explainable on the theory of capillarity, the weight of the flat particles of gold being insufficient to overcome the surface tension of the water until the air cushion was broken by shaking the pan.

In regard to this phenomenon—that is, something we cannot quite explain—it has been shown, by the experiments referred to, that most substances condense air on their surface, which acts as an air-bell to buoy them up. When a solution in which a gas is generated by some dilute acid, such as sulphuric, is employed, there is a condensation of gas on the surface of minerals and the formation of a film that is persistent to a varying degree.

Even perfectly dry sand, especially if it be in perfectly angular particles, will float on water. Iron pyrite is easy to wet and therefore difficult to float,

whereas the contrary is true of stibnite. Experiments made with the last-mentioned sulphide and with molybdenite show that in hot water the particles of mineral will float, by reason of the bell of air and steam formed on their surface. It amounts to this, that all solids have on their surface when dry a film of gas, usually air; those that yield up this film in water become wet and sink; while others, especially certain sulphides, possessing 'greasiness,' do not part readily with this film, are not wetted and will float. The air-film can be increased by the slow generation of some other gas, such as the carbon dioxide derived from the carbonates in the ore, through the action of a dilute acid, particularly when a sulphide, slightly oxidized, is coated with its equivalent carbonate. It is on this fact that the new processes depend; they represent one of the most interesting departures in metallurgy and they promise to be of exceeding importance because of their application to a class of ore beyond the reach of ordinary methods.

Air Blasts in Mines.

Recent press despatches from Houghton, Michigan, have stated that many miners in the Lake Superior copper region have left work because earthquakes or air-blasts have been so frequent and so severe as to endanger their lives. In several mines there have been a series of shocks of more than ordinary intensity, and even at surface houses have been shaken and disorder created in the china pantry. As a rule, these disturbances are sensitive to atmospheric conditions; it has been noticed that they begin shortly after midnight, to continue to a less degree during the following daytime.

This is an interesting subject, the more so because it is not well understood. Similar occurrences underground have been recorded in the Hillgrove district, New South Wales, and in the Mysore mines, India. Miners usually impute these rock 'explosions' to earthquakes, to gases and to the 'little men,' the gnomes who, according to folk-lore, are supposed to delve underground when the workmen leave the mine. These 'air-blasts' are not really explosions, but they are due to the bursting of rock under great pressure and the disturbance to the air of the mine produced by the shock of disruption. They characterize mines where the rock is under particular strain by reason of big cavities created by stoping, causing large masses of rock to exist under unbalanced stress. It is the custom to support the hanging wall by means of portions of lode which are left standing, to do duty as pillars; these pillars hold the ground until the pressure from above becomes too much for them. Then they do not yield gently, but, like a cubical block under a testing machine, they break suddenly with explosive violence. The bursting force is due to external and not to internal conditions, as has been pointed out by Mr. F. W. Sperr, professor of mining in the Michigan College of Mines. When the pressure has become more than the pillar of rock can bear and the moment of rupture has arrived, even the scratch of a pick will precipitate a crash. When this happens, the walls of the stope will vibrate and an earth-tremor is transmitted to surface. Where the rock will not stand and the walls yield slowly, so as to close the excavations made by mining, there are no air-blasts or similar disturbances. Where large areas of roof are left unsupported in flat veins, it sometimes happens that the hanging finally falls suddenly, and then, acting like a piston, it forces the air out of the old stopes with all the violence of a gas explosion. But it is the former and not the latter case that obtains near Houghton. In such mines as the Quincy, where the copper lode dips at 37° and an area several thousand feet in both directions has been excavated for a width of 8 to 20 feet, there is a big 'overhang' and an excessive pressure, which is suddenly released when one of the pillars in the old stopes gives way. It is a question whether it would not be better to 'rob' the pillars and permit the hanging to come down and 'key' itself. In New South Wales, in mines similarly affected, the rock is a silicious slate, which, after exposure to the air, splits and 'kicks' with violence, although the more serious 'explosions' occur when a 'bridge' is being removed below a level. Men's faces have been badly cut by flying splinters of rock. It is held by Mr. J. B. Jaquet, the Chief Inspector of Mines in New South Wales, that the 'kicking' is due to the fact that the slate is so brittle that it breaks rather than bends; it resists pressure as long as possible and then bursts, this being hastened by the shock of blasting or hammer-work. The large explosions are due to the same general cause, namely, a general condition of strain due to the removal of rock by mining. It is noticed that the disturbances at Hillgrove have gained in severity as the mine has deepened; in the neighboring Sunlight mine these troubles are unknown, because the workings are in a slate of a more yielding character. It has been recommended that in 'kicking' ground the pressure be taken up gradually by the use of soft head-boards in conjunction with stulls and the filling of stopes when they approach the level above. In the case of wide lodes, such as the amygdaloid copper veins of Lake Superior, where timbers are used sparingly, if at all, and pillars are left to support old workings, there is nothing to prevent such troublesome consequences as 'air-blasts,' and the annoyance, with possible danger, due to them is sure to increase as the strains in the rock become greater in the course of deeper and more extended workings.

Harnessing the Zambesi.

When one remembers that Livingstone was rescued by Stanley only twenty-five years ago and that Stanley himself emerged from his last great exploration of the Dark Continent only sixteen years ago, these events marking the breaking of light into the slave-trodden gloom of central Africa, we are likely to appraise at its proper value the building of a cantilever steel bridge over the Zambesi, the construction of a railway to Lake Tanganyika and the meeting of the British Association for the Advancement of Science, with the son of Charles Dawson as its presiding officer, at the Victoria Falls, where the great river hurls itself into a deep cleft cut in the level plains of central Africa. While civilization has been advancing into the hinterland of the once dark continent, the conquest of industrial art has been emphasized at Johannesburg, where gold to the value of a hundred million dollars per annum is being steadily produced. And now, in the fulness of time, there comes the proposal to harness the untamed energy of the Zambesi for the service of man; the project is being discussed of transmitting electricity from the Victoria Falls to the mines of the Rand. The distance is 556 miles in a direct line, or 745 miles indirectly along the new railroad. It is agreed that the horsepower available varies between 300,000 and 500,000 by the direct drop of the water at the falls. Electric transmission of this power by the Thury constant direct-current system is considered perfectly feasible, but it is seriously questioned, by such an authority as Professor W. E. Ayrton, whether the scheme would prove profitable, because there is not likely to be sufficient demand for power along the route to justify the transmission the whole distance involved in a line to Johannesburg. It is estimated that about 150,000 horsepower is needed by the Rand mines and their associated industries. Another disturbing factor is presented by the existence, in the Transvaal and in Rhodesia, of coalfields, the product of which might be burnt as a source of energy to compete with the great electrical enterprise. Ayrton holds that at a price of $2.50 to $3 per ton, excellent coal can be delivered on the Rand, and that this fact kills the commercial possibilities of the long-distance transmission of power. At the present time it costs about $100 per horsepower per year on the Rand and $15,000,000 is thus spent annually. Niagara transmits 24,000 horsepower to Buffalo, 30 miles distant, for 14 cents per horsepower-hour, equivalent, on an 8-hour basis, to $124 per horsepower year, or more than the present cost of power at Johannesburg. In other words, the projectors of the Zambesi scheme expect to transmit power 745 miles at a cheaper rate than it is delivered at a distance of 30 miles from Niagara. We may add that the voltage to be used, under the Thury system of high-tension direct current transmission, is 140,000; a number of generators will be used in series and the center point of the generating system is earthed so that the pressure of each conductor above earth is 70,000 volts. The line will be built of aluminum cables—not copper—supported on steel towers. The project continues to be the subject of vigorous discussion in electrical journals.

By the Way.

In a recent address before the American Association for the Advancement of Science, in discussing the effects of transportation on combination, Mr. Martin A. Knapp said:

When movement was measured by the strength and endurance of animals, only a limited area could be reached from a common center. Its slowness and expense confined all inland distribution within narrow bounds. Only 80 years ago it took a week to send a letter, and cost $125 to move a ton of freight from Philadelphia to Pittsburg; and the average price for carrying the necessaries of life was not less than 20c. a ton for each mile of distance. On such a basis most commodities were shut off from distant markets, and farm products, for example, would seldom permit of conveyance more than 100 or at most 150 miles. Only such articles as were of small bulk and weight compared with their value were moved to any considerable distance from the place of production. For this reason the requirements of an ordinary family were almost wholly supplied from near-by sources. And this means — without amplifying the statement — that productive energy, for the most part, was restricted by the consuming capacity of the surrounding neighborhood. The forces outside each little circle were but feebly felt and had slight influence upon its separate affairs. Broadly speaking, the business of each locality was adjusted to its own conditions and was practically undisturbed by like operations in other places. What we call competition was held in check by slow and costly means of conveyance; its effects were moderate and limited, its friction seldom severe.

But the use of steam for motive power and electricity for sending news increased enormously the range of accessible markets, and at once intensified competition by the celerity and cheapness of distribution. Industrial strife has already become world-wide in extent, and distance an ineffectual barrier against its destructive assaults. For distance as a commercial factor is not at all a matter of miles, it is merely a question of time and money. So the effect of cheap conveyance and quick communication is to bring remote places closer together. For all the practical needs or enjoyments of life, Manila is nearer New York now than Montreal was a century ago; and the whole world could be easier governed from Washington today than could the United States when the capital was located on the Potomac.

Our grandparents got their supplies mainly in the neighborhood where they resided, and only a few persons were concerned in their production. Today it may safely be said that five millions of people and five hundred millions of capital are directly or indirectly employed in furnishing a family dinner. When merchandise of every description is moved by the ton at great speed from one end of the land to the other, and at an average cost of less than three-quarters of a cent per mile, as is now the case, the expense of transport is but a trifling impediment to the widest distribution.

Nor should we forget that it was the opening up of new and ever enlarging markets, by the cheapness of steam transportation, which gave the first opportunity for the extensive use of machinery; and this in turn quadrupled the capacity of labor and greatly reduced the cost of large-scale production. By this revolution in the methods of manufacture—caused by the railroad and steamship—the mechanic was supplanted by the operative, and the skilled and independent craftsman of former days found his occupation gone. For what chance now have handmade articles when the factory-made product is carried across the continent at nominal cost? But the factory without the railroad would be only a toy-shop. If its wares had to be hauled over country roads by mules and horses, the points they could reach would be few and near by, and thus contracted sales would limit the size of the plant and the volume of its business. It is simply because transportation is now so speedy, so cheap and so abundant that great establishments have become profitable and driven their smaller rivals from the field.

These facts bear directly, and with a force not fully perceived, upon the whole problem of industrial competition. The argument runs this way: As the means by which industrial products are distributed become more convenient, quicker in action and less expensive, the area of distribution rapidly enlarges, and as the area of distribution enlarges the competition of industrial forces increases in something like geometrical ratio. The movement of property by rail in the United States alone already exceeds four millions of tons every 24 hours. Think of the rivalry of products, the strife of labor, the strain and struggle of trade, which such a movement implies. With the constant acceleration of that movement, which is certain to happen, how long can the friction be endured? How soon will it become unbearable?

The truth is that new conditions have arisen and new methods must be adopted. All the pressure of modern life impels to the co-ordination of effort. We see that discord and antagonism, to say nothing of their moral bearing, have far less efficiency than harmony and co-operation. The world is searching for economies. It is intolerant of needless expense.

Concentrates.

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and to give information dealing with the practice of mining, milling and smelting.

AS MANY giants may be operated on a gravel bank as can be supplied with the water available.

BENDS may be made in pipe-lines fitted with flange unions by using unions provided with angles of suitable degree.

COMPANIES organized under the laws of other States and operating in California are subject to the laws of California.

THE chief ingredients of the phonolite of the Black Hills, South Dakota, are sanidine, nephelite, ægirine, noselite and sodalite.

THE averaging of mine assays without reference to the amount of ore which each assay represents is entirely useless—it means nothing.

OWING to the curvature of the earth, a mountain 5,717 ft. in height would be invisible at the distance of 100 miles, viewed from the seashore.

CLOTH dipped into a 30% solution of ammonium phosphate, and dried, becomes uninflammable. It will char but not blaze, and the fire does not spread.

IN many stamp-mills the capacity per stamp exceeds five tons daily, but large capacity is not always synonymous with the best obtainable economic results.

THE addition of manganese to steel is said to increase its tensile strength and reduce its malleability. Both manganese and chrome steel are extremely hard.

A POCKET mine is a peculiar piece of mining property. When in bonanza, the owner will only sell at an exorbitant price, and when no gold is in sight no one cares to buy.

WHERE black sand, upon assay, shows high values in gold, but none of which can be obtained by amalgamation, the sand should be shipped to a smelter for treatment.

SOME of the tallest chimneys in the world have been built of concrete. More recently it has become the common practice to re-inforce concrete with upright steel bars.

GASOLINE ENGINES, or similar devices of any kind, cannot safely be employed underground in mines, unless the exhaust gases can be conducted by pipes out of the mine.

IT was until comparatively recently supposed that the centrifugal type of pump was only adapted to low heads, but it is now known to operate with equal success under high heads.

THE semi-cemented gravel and sand found in desert countries is known throughout the Southwest and Mexico as caliche. It is often gold-bearing, and in some localities rich in gold.

SHEET LEAD may be joined for the purpose of lining tanks or barrels to contain acids. About acid works men are employed to do this class of skilled labor, who are known as 'lead burners.'

CHLORIDE AND HORNSILVER are different names for the same ore. The technical term for silver chloride is cerargyrite. It occurs in finely disseminated grains, in flat flakes and both in masses or veinlets.

IN the Western mining States there is always a discount on the price of copper, from two to three cents per pound, below New York prices, on account of transportation, refining charges, commissions, etc.

COATING copper plates with silver, in order to catch gold by amalgamation, originated in California. The use of copper plates, with an amalgamated surface, was first adopted in placer mining, also in California.

IN many mills where the tailings contain from 50c. to several dollars per ton, better results could be obtained if more attention were given to closer saving and less to capacity. However, the economic conditions must determine.

PLANED four-inch boards make a good floor for a canvas slime-plant. The lumber should be well seasoned, and the boards, when nailed down, should have about half an inch space between them to prevent buckling when wet.

THERE is a law on the statute books of Utah which makes it unlawful for two corporations to exist in that State having the same name. This sort of legislation might be extended to include the duplication of the names of mines, a practice all too common.

THE square-set method of mine timbering was first introduced into the Ophir mine on the Comstock Lode, Nevada, in 1860 by P. Deidesheimer. It has since been employed in every part of the world, though there are many modifications of the original method now in use.

ALTITUDE is not a factor in the operation of a gas or gasoline engine. It works equally well at high or low altitude. The engine depends upon the expansive force of the gas created by the ignition of the gas or vapor, which is entirely independent of the pressure of the atmosphere.

IN sharpening drill steel, the blacksmith must carefully avoid overheating it, as this destroys the carbon in the steel, which renders it useless. When this occurs the burned portion had better be cut off, as only an expert can treat the metal so as to render it reasonably serviceable again.

ADJOINING claim-owners may by agreement sink a joint shaft on the property line, either on the vein or any other place, for development. In such case $200 worth of work must be done in the shaft annually if it is intended to make this work represent the annual assessment on two unpatented claims.

THE California State Mining Bureau has issued fairly good maps of the desert region of southern California, and Bulletin No. 208 of the United States Geological Survey contains a good map of southern Nevada and a part of California. These maps show many of the roads and springs, and are of great value to prospectors.

MINERS sell promising mining claims to secure capital to prosecute their calling—the discovery and development of new mines—to better advantage. The fact that the prospector wishes to sell out is not an indication that his mine is worthless, any more than that a stock of goods is without value because the merchant desires to sell.

IT is unwise to carry the stopes in a mine too close to the shaft when the latter is sunk in ore, or where it passes through an orebody. A large-sized pillar should be left about the shaft, which may be removed when abandoning the mine. Failure to leave a pillar, as suggested, may result in the necessity of sinking a new shaft.

AN alternating current in electricity means a current which changes its direction with great rapidity. The number of alternations per minute is determined by the number of revolutions of the armature. If the armature of a bi-polar dynamo makes 3,000 revolutions per minute, then there are 6,000 alternations of the current during this period.

IN many of the large pits created by early hydraulic mining operations in California there has appeared a growth of pines and other trees, almost equaling the neighboring forest which remained untouched by miner or woodman. Some of these pits cover many acres, and near Gold Run and Dutch Flat the denuded area spreads over several square miles.

STEEL RAILS weighing 35 lb. to the yard are heavy enough for use in inclined shafts sunk at any angle. Such rails will carry fairly heavy traffic without bending under ordinary conditions on light railroads. Skips in mines rarely weigh, with full load, over seven tons, and usually not more than four tons; consequently, 35-lb. rail is heavy enough for any mine-shaft traffic.

THE assay ton contains 29.166 gm., and the ratio of the assay ton to the milligram is the same as that of a ton of 2,000 lb. avoirdupois to the troy ounce (1 in 29.166), therefore, if an assay ton be taken for test, the number of milligrams of gold contained in the assay ton indicates the number of troy ounces of gold in a ton of the ore of which the portion assayed is a sample.

THE cost of producing a pound of copper cannot be arbitrarily stated, as it varies greatly at different mines, and also at the same mine with variable grades of ore. It is manifestly cheaper to smelt copper from high-grade than from low-grade ore, but the mining costs may vary so greatly that the metal may cost less per pound from a large low-grade deposit than from a small high-grade vein.

AN OPEN *arrastre* is made and operated in the same manner as any other, except that the screens are dispensed with, and the drags are run more rapidly than is usual. For the best success mechanical power of some kind should be employed — water, steam, gasoline or something else. The open arrastra is generally used to disintegrate gravel that is partly cemented and really does not require stamping.

THE highest altitude at which gold dredging is successfully practiced, known to 'Concentrates,' is that near Breckenridge, Colorado, which is about 9,000 ft. above sea level. Most of the dredging being done in California is only a little above tide-water. Several years ago a steam-shovel was employed for a time on dry gravel in Holcomb valley, San Bernardino county, Cal., at an altitude of 7,000 feet.

WHEN a crack has developed in a sheet of metal, its further progress may be stopped by drilling a hole where the crack ends, which is not always easy of determination unless care be taken to find it. This may be done by moistening the surface of the metal with petroleum. Rub clean and dry and then apply chalk. The petroleum, which has penetrated the finest crack, oozes out and makes itself visible on the chalked surface.

ONE of the largest water installations for mining purposes in California in early days was that of the Park Canal & Water Co., taking water from the Cosumnes river. It had 290 miles of ditch, eight miles of flume and one mile of pipe-line. This system cost $2,000,000. The Mokelumne Hill system cost $500,000 and that of La Grange Company $450,000. There was invested in hydraulic mining business at the time of its inhibition about $100,000,000.

TOPOGRAPHICAL SITUATION has much to do sometimes with the cost of equipping a mine. 'Concentrates' has knowledge of a number of mines where the machinery was delivered at the top of a hill or ridge back of the mine, and 'skidded' down the steep slope by means of ropes snubbed around trees, or by block and tackle. It is seldom that machinery placed under such difficulties is ever removed elsewhere, whether the original venture is profitable or not.

WHERE the land about a proposed shaft is flat and no dump is available, a substructure of heavy timbers may be built up about the site of the shaft and extending upward 8 or 10 ft. or more. The rock hoisted from the shaft may be dumped around it, filling in the timber frame and rendering it rigid. In time a gallows-frame may be set upon, this substructure, and mining proceed as in other places where the shaft is located on a hillside.

THE Colorado Supreme Court recently decided in a tunnel case that the proprietor of a claim may drive a level through an adjoining claim owned by another to reach his vein lying beyond. This was on the grounds of 'eminent domain.' The courts have not heretofore recognized mining as a public utility, and the right of eminent domain did not obtain. Before this decision can be recognized as final it must be passed upon by the Supreme Court of the United States.

A DUST ARRESTER which proved successful was installed at the copper smelter of the United Globe mines, near Globe, Ariz., some years ago. It consisted of a cylinder 8 ft. in diameter and 72 ft. long. It was placed horizontally on the roof of the building, just back of the blast furnace stacks, and was connected with them by pipes 36 in. in diameter. The smoke and dust were drawn into the large cylinder and carried toward one end, where the dust accumulated, and thence conveyed to a briquetting press situated below.

EXPERIENCED hydraulic miners always avoid breaking down the gravel bank in the form of a horseshoe. If this is done, in a short time the miners find themselves surrounded on three sides by the banks, and unless the workings are very large they can no longer work to advantage. There is also an element of great danger introduced when the face is not kept in a nearly straight line. This involves the necessity of more than one giant, or the frequent re-setting of the one, if only a single giant is in use, but it pays in the end to keep the bank straight.

AS BETWEEN the various types of crushing mills now on the market, the would-be purchaser must take into consideration the character of the ore to be crushed; whether sliming will be disadvantageous or not; the adaptability of the several mills as amalgamating devices (should amalgamation be contemplated); the amount of power required to operate the mill relative to its capacity; the wear and tear and liability to breakage and accessibility of foundry or machine shop, where necessary repairs may be made. All of these things, as well as original cost and expense of transportation, setting up, etc., should be considered.

WHERE two claims overlap and the prior location has expired by reason of non-compliance with the law, the newer claim may take the ground wholly, or in part, covered by the former location. It may be the better way to re-locate the abandoned claim, to prevent others from taking the otherwise unoccupied portion of the first location, for, unless claimed by another, the prior locator's title is still good until the ground is claimed by a new comer, when he no longer has a color of title to the land. Of course the laying out of two locations will necessitate the performance of work on two claims, or of $200 on one of them for the benefit of both.

ALTHOUGH there would seem to be no good reason why the chlorination of ores by means of chlorine generated by electrolysis should not be commercially successful, we do not know of any place where it has been a commercial success. The method has been tried repeatedly during the last 50 years, both in the wet and the dry way, and often succeeds very well in small-scale tests. The only large-scale experiments in 'chlorine smelting' are in connection with the treatment of certain zinc-lead-silver ores by electrolysis with fused zinc chloride. One difficulty is the disposal of the by-products, for mines are rarely at industrial centers. A number of results have been published in the journals on this subject, but we do not know of any place where these methods are in successful commercial use.

Discussion.

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy.

THE BEST SHAPE FOR A SHAFT.

The Editor:

Sir — An interesting discussion has arisen here in regard to the proper shape and dimensions for a deep shaft, involving the questions of speedy sinking and the adaptability of the shaft afterward to the economical handling of dirt and water.

The shaft contemplated was proposed to be sunk to a depth of 2,300 ft. The character of the vein in the upper levels warranted expectations of a large tonnage of ore, while experience in other properties in the neighborhood pointed to the probability of enough water to justify preparations for pumping. Consequently it was deemed advisable to provide for a possible hoisting capacity of 1,000 tons of rock per day, together with a sufficient compartment for pump and ladder-way.

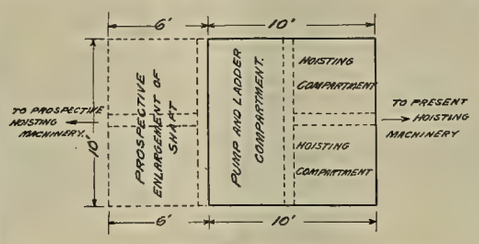
The manager made the general proposition that for the required capacity, a three-compartment shaft 5 by 16 ft. would be of sufficient size, admitting of two hoisting compartments each 4 by 5 ft., and a pump and ladder-way 5 by 5 ft., exclusive of the timber. The firmness of the walls of the shaft would permit the elimination of wall-plates, thus economizing a considerable amount of timber, as well as two feet of excavation in the side of the shaft to make room for the wall-plates, the item of timber especially running into a good deal of money in this part of Mexico.

At the most convenient site for the projected shaft, an old Mexican shaft, 10 ft. square and 320 ft. deep, already existed. The old shaft was in perfect condition as far as the firmness of the walls was concerned, and it was proposed by the company to utilize this old shaft, starting to sink in the bottom of it. In attempting to adapt the old square shaft to the requirements of a three-compartment shaft, complications were introduced. It was proposed to make use of the old shaft, the width of which would easily permit of two hoisting compartments side by side, allowing a space 6 by 10 ft. for these two compartments, a space 4 by 10 ft. would then be left for pump columns and ladder-way. In starting the new part of the shaft, however, it was proposed to change the dimensions, increasing the length to 16 ft., while, at the same time, reducing the width to 5 ft., making the new part of the shaft 5 by 16 ft. This would make a jog at the point where the sinking would be resumed. The hoisting compartments would be carried down into the new portion with the same dimensions as that allowed in the new shaft, and the pump columns would be brought into the end compartment, constituting the jog between the old and new shaft, by a gradual curve, care being taken to avoid anything approaching an elbow. The subjoined sketch will serve to further explain the change proposed.

All of this, when submitted to the directors, was very vigorously opposed, they claiming that the best plan to pursue would be to carry down the shaft with the same dimensions as started by the Mexicans, namely, 10 by 10 ft., or to make it 10 by 11 ft., and to make such dispositions as would permit of the shaft being lengthened, making it finally 11 by 16 ft. These last dimensions were supposed to be necessary to maintain the production spoken of above, but it was not proposed to make the shaft the full size until the lode had been proved up and the showing found to warrant the expectation of 1,000 tons per day.

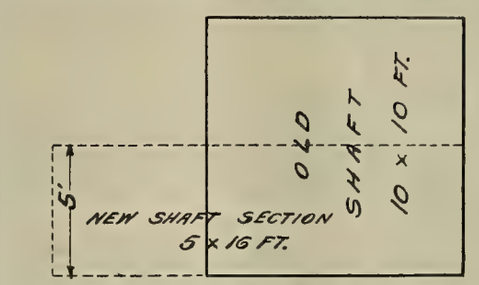
The directors further claimed that: (1) It would cost very little, if any, more to sink a shaft 10 by 10 than one 5 by 16 ft. (2) A deeper cut might be made in a 10 by 10 shaft than in a 5 by 16 shaft. (3) The shattering of the sides of the shaft would be much greater, or the number of short holes needed to square out the shaft would be more in a shaft 5 by 16 than in a shaft 10 by 10. (4) A shaft 10 by 10 would give the same number of hoisting compartments and a larger compartment for pumping, ladder-way, and general pipe and electric wire purposes. (5) In view of the possibility and probability of a later necessity for a large hoisting capacity — larger than possible or advisable for two hoisting compartments — the enlargement of the 10 by 10 shaft to a 10 by 16 shaft, which, as shown in annexed sketch, would give four hoisting compartments and one pump compartment in the center of the shaft, and could be done much more cheaply and quickly than sinking another hoisting shaft. This is an eventuality which we have to take into serious consideration. Objection was also made to the jog at the bottom of the old shaft, principally on account of the possibility of not being able to hoist or lower pump columns, or anything else that might be needed in that compartment.

Those who favored the narrow shaft, brought forth various objections to the 10 by 10 shaft, among which was mentioned the inconvenience of timbering a shaft 10 ft. wide, to say nothing of the increased size of the timbers necessary for these dimensions, in this way adding materially to the expense. It was admitted that the jog was an undesirable feature, as it detracted from the symmetry of the shaft. It was not admitted, however, that the reason for hoisting through the pump-way constituted a valid objection. Even though the pump compartment might be straight enough to hoist through, it was held that generally it would be easier and simpler to use the hoisting compartment for handling the pump sections, unless it were a question of water columns for a Cornish pump, the use of which was held to be extremely unlikely. In the event of repairs to pump columns, the joints are generally removed singly, and it is certainly easy enough to swing a joint of ordinary pipe from the hoisting compartment into the pump-way through the timbers. Those on the ground in Mexico also claimed that the speed of shaft sinking depended rather more on the amount of dirt to be taken out than on the depth of hole drilled, that is,

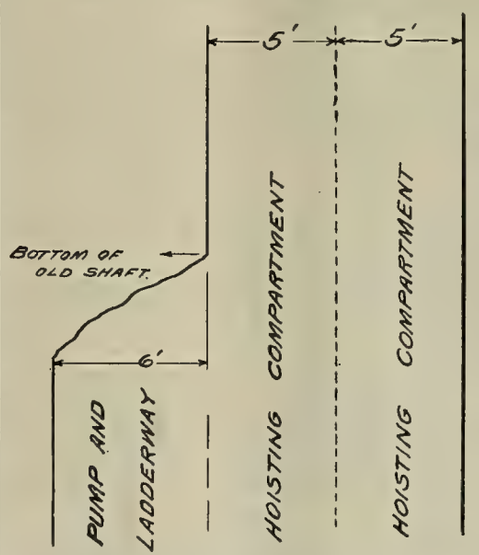


Manager's Proposal.

within the limit of a reasonable depth; the mucking being the principal item in the consumption of time, generally requiring more time than the drilling. The speed of sinking, therefore, depends in a large degree on the shaft section, and with a given hoisting capacity it is almost proportionate to the size of the section. In the actual drilling, the size of the shaft does not make so much difference, because the larger the section, the larger the gang of drillmen that can



PLAN OF SHAFT SECTIONS.



VERTICAL PROJECTION OF THE ABOVE PLAN.

Directors' Proposal.

be accommodated. There is no way, however, to take advantage of the mucking in a shaft of larger section, because the buckets can only be hoisted as fast as the machinery will run, and it will be found generally that the buckets will be filled and waiting, especially after the depth of 300 ft. is passed. It was also felt, that if such dimensions as the directors proposed were advisable, they would have been adopted long ago in South Africa, California, and other mining regions where the subject of deep shafts has been under consideration for many years by some of the most experienced mining engineers of the age.

This, Mr. Editor, is submitted with the hope that it will provoke some remarks from those of the mining fraternity, whose experience has led them to study the subject of shaft sinking.

R. H. BURROWS.

Guanajuato, February 5, 1906.

ELECTRICITY VS. COMPRESSED AIR FOR MINE OPERATIONS.

The Editor:

Sir—The discussion between Mr. E. A. Rix and Mr. W. R. Hulbert upon this subject is interesting to us, who are actively concerned in the practical operation of the two forms of power, and I believe much good can be gained from their articles. My experience with compressed-air and electricity in mining operations leads me strongly to favor Mr. Rix's side of the argument; I shall confine my reasons for siding with him by stating a few points which he has not taken up as thoroughly as I believe is necessary.

We, who have mined, know the air-drill, know what it will do under the most adverse conditions, and have learned to place our confidence in it; the electric-drill, today, is by no means such that it has our confidence; I have seen tabulated results of competitive tests between air and electric-drills. On paper it looked very favorable for the latter, but we who have used both underground from week's end to week's end, have reason to doubt these figures.

The electric-drill, to operate successfully, depends upon certain conditions; among these conditions are: 1st. It needs a runner who thoroughly understands the drill and its mechanism, and who has a good stock of patience. 2nd. The drill must be handled with care; it has many frail parts, such as springs, gearings and flexible shafting, etc., which will not stand rough usage.

To explain my point, I will describe the conditions existing in the mining camps of the West. I want a machine-man, or I may want 10 or 15 of them. I cannot ask such a man for his credentials as a mechanic or electrician, but I am forced to take whomever I can get; he may be a good machine-man and he may not; if he is put on an air-drill he may knock it around and abuse it, but he does little damage to it; if he is put on an electric-drill, he must know something about it, mechanically, and must not hit it with a single or double 'jack' when the hole is 'fitcured.' It is the custom, when the drill sticks in the hole, to jar it loose with a hammer; I have seen a drill-runner hit the 'chuck' with a 'double-jack' so hard that it would have wrecked an electric-drill. You may say that such a man should be discharged; well, he should, but you cannot watch every man in a mine for eight hours; and should you discharge him, his successor will probably do likewise; and in the meantime your electric-drills are going to the repair shops and the scrap heap.

It is all very well to say an electric-machine will drill as much ground as an air-machine; it will do so in a uniform block of granite, but get it underground in the wet and dust and dirt, start in on a stratum of rock having 'slips' and 'vug-holes' occurring at any and all points, and I believe you will find the air-drill will walk away from the other.

The factor of air-compression, at high altitudes, is the strongest point in favor of electricity. I believe Mr. Rix treats it too lightly in his article of January 8. At an elevation of 10,000 ft. a compressor loses 50% of its efficiency, and it takes about 130 cu. ft. free air to run a 3½-in. drill; this, of course, makes the operation of drills expensive. It is in high altitudes that the electric drill is making its strongest bid for favor, and in consequence mining men in the San Juan district, Colorado, have been led to experiment with it carefully. I can specify several large companies that have done so only finally to discard them; among others may be mentioned the Silver Lake, Sunnyside, Liberty Bell and the Frisco mining companies; there are several smaller companies also that have experimented. The general cry against the drill is invariably the same from all, namely, too frail to stand the hard usage underground, high repair expense, and inability to compete with the air-drill in various kinds of ground.

The air exhausted from the drill is an important factor underground, be it in a shaft, raise, drift or stope; I have seen many cases where the machine exhaust was almost the sole source of air-supply for the miners; when the machine was shut down the air would become very poor, and as soon as the air was turned on one could breathe with comfort. This method of ventilation is not expensive for, as Mr. Rix states, the air used is a by-product. As there are always other provisions made for ventilating the main workings of a mine, compressed air is very seldom used, on a large scale, for this purpose; there are too many other methods that are cheaper.

In the San Juan region (the triangle included between Ouray, Silverton and Telluride) compressed air is used almost exclusively; in most cases the compressors are belt-driven, with electricity as the motive power. This electricity is furnished either by a custom plant or is generated by the mining company itself. Some of the mines in this region are controlled by large companies that employ as managers or consulting engineers the best men procurable in the profession; these men are active and wide-awake

to gain the best results possible for their respective companies, they are familiar with all the latest mining machinery and are constantly on the lookout for some contrivance that will cut down operating expenses, they all, or nearly all, have tried the electric drill—with what result? You go to the machine shops and in the corner, where the scrap heap is, you find electric drills of every make and kind. These representative men of the mining profession have discarded the electric-drill. Could the air-drill ask more as a recommendation?

I do not want the electric-drill people to think that I am a knocker at heart, for I am not; I believe that some day the electric-drill will be made a practical machine for underground work, and when that time comes, I shall be one of the first to acknowledge it. We all admit the saving of power of the electric-drill over the air-drill—we cannot get around that fact—and we all want to operate as cheaply as possible, but in the air-drill we have a machine we can depend upon to do our work under any and all conditions and still put up with much abuse from the miner; the electric drill will not do that.

A word about these competitive tests. They are in most cases positively worthless; they are made for a shift or two in a rock that is advantageous to one drill or the other (intentionally or otherwise) and the drill which has shown its supposed superiority advertises a great victory. There is but one way to conduct such a test: take the two machines in question and put them together or in opposite shifts in a drift (shaft, raise or stope) for a week or two, then change them to another part of the mine in different rock or ore. During these periods keep careful account of all repairs, break-downs, amount drilled and all interesting data, sum it all up at the end of the test and decide which you want to buy. The drill that does the best work in one mine or district will fall below the standard in another mine or district.

I have confined myself to drills in this letter, for the reason that Mr. Rix has dealt with compressed-air machinery in general; I believe that this subject of drills is one of great importance, as there is so much money being expended by mine operators in experimenting in this direction. I hope both Mr. Hulbert and Mr. Rix will deal with the subject again, giving figures and data for us to think over and compare with our own figures. As you, Mr. Editor, state in your note at the end of Mr. Hulbert's article of Jan. 27, unless figures are accompanied by all the conditions under which the tests are made, they do not mean anything.

H. R. Plate.

Denver, February 15, 1906.

Manufacture of Plaster of Paris.

The gypsum rock is reduced by a jaw crusher (cost, $1,000) to about one-inch cube. As this material is mined in large cakes, the opening must not be less than 20 by 12 inches. When crushed, the rock is dried in a rotary direct-heat dryer (cost, about $2,500). The products of combustion used in drying this material should not pass through the material on account of the danger of coloring it, that is, the drying must be done on the outside of the dryer, only. The size of the dryer will depend upon the capacity required; it should connect with a chamber to settle the dust, which is valuable. After the gypsum is thoroughly dried, it is again thoroughly crushed on an ordinary pot or bowl-crusher (cost, $300). It should then be ground to about 80-mesh. French buhr-stones are generally used (four of these, at $300 each). The ground gypsum is then passed into a calcining kettle (cost, $1,200 each), usually 8 ft. diam. and 8 ft. high, with gears, flues, fire-front, grates and doors, also with upright shaft and stirrers near the bottom, driven with heavy gears above. The ground material is slowly passed into the calcining kettle, which soon begins to boil. More material is gradually added, until the kettle is full. From the gypsum rock that has been crushed and dried thoroughly, a portion can be calcined within about one and one-half hours, the time depending upon the dryness of the gypsum and the quality of the finished product. The material contains enough moisture to boil it thoroughly for a short time, after it comes to a dead state; then it will boil a second time, and in many cases even a third time; the more it boils the quicker it will set. For ordinary plaster work only one boiling is required, but for fine work or plaster of paris two boilings are necessary. This calcining kettle is where the mechanical change takes place. After it is sufficiently calcined or boiled, as it were, it should be immediately emptied and placed in hoppers or bins made of iron or brick, after which it is ready to be conveyed and elevated to storage bins, from which it is packed into sacks or barrels ready for the market. As soon as the kettle is emptied, another charge should be immediately put in.

To manufacture, say, 100 tons of plaster per day, it will require the machinery mentioned above, with the addition of the necessary hoppers, bins, conveyors, elevators and the power. If it be desired to make this material into wall plaster, it will be necessary to add further one sand dryer and a hair picker; also the necessary apparatus for mixing the different materials.

The Price of Copper.

During the past few months the high level of prices for copper was not reached without some manipulation; but it must be admitted that the condition of the market—especially the statistical situation—fully justified an extremely high level of prices. The fact was that, according to the best information obtainable in the trade, surplus copper supplies in this country were actually wiped out, and the urgent demand on the part of home consumers forced the sellers to put up their prices for their home production. Of course, the wild stories which were circulated, as to the possibility of a 21 or 22-cent price, had the effect of inducing some consumers to 'overbuy' for forward delivery; but this did not occur until very late in the period of advances, and was probably mostly done by such consumers who had hesitated to buy at much lower prices. A glance at the statistical situation will show the justification for the high price of copper up to the end of 1905:

	Pounds.
The exports of copper during the first six months of last year amounted, in round figures, to	280,000,000
The total available supplies from production and imports for the whole year are estimated at	1,100,000,000
Or for the first six months, assuming the same ratio	555,000,000
Deducting exports	280,000,000
There remains available for home consumption	275,000,000

According to conservative estimates, consumption in this country probably absorbed 50,000,000 lb. per month, and it is evident that, if consumption during the first six months of 1905 absorbed such an amount of copper, the available supplies had to be drawn upon. Consequently, when the home demand—with a general revival of business in the steel and iron trade about the middle of last year—commenced to improve, and purchases were made for forward delivery, the market was found to be bare of stocks and easily advanced to 19 cents or thereabout.

Production is increasing, and a conservative estimate will put the figures for 1905, including the increased imports from Mexico and Canada, at 1,250,000,000 to 1,300,000,000 lb.—say at the rate of about 105,000,000 lb. per month. Exports have fallen off. China, which took during the last year 80,000,000 lb. of our export copper, is re-shipping part of the copper which the Chinese speculators had bought for the different mints to Europe. The total exports of copper for the past year, according to the official statistics, amount to 534,907,619 lb., of which about 80,000,000 went to China, leaving for Europe about 455,000,000 lb., as against European takings in 1904 of 555,000,000.

The effect of the high prices on European purchases was immediately apparent during the year 1905. Exports to Europe continued large during the first part of 1905—that is, as long as European purchasers were receiving copper which they had purchased at low prices during the latter part of 1904; but exports fell off during the latter part of the year and are now at rather a low ebb. They were about 15,000 tons, or 33,000,000 lb., during January, and are not likely to be very large during February and March. With the increased production, this will leave available for home consumption from 65,000,000 to 70,000,000 lb. of copper. It seems quite reasonable to suppose that, as long as the iron business continues as good as it has been, domestic consumers will absorb most, if not all, of the surplus left over after exports have been deducted from the production, although, as stated at the beginning of this letter, some consumers may have bought a little bit more copper than they actually need at present and may be willing to carry it over until later months.

At the present time there is a good deal of controversy and question as to the correct price of copper. The big producers in this country, probably controlling 75 per cent of the total production, have not changed their prices from the top level reached—that is, 18¼ to 18¾ cents for Lake and 18⅝ to 18¾ for electrolytic. But copper re-shipped from China has been pressed on the European market, and has been sold far below these prices. This has, naturally, tended to demoralize the domestic market, because the European consumers who are expected to supply themselves for the bulk of their copper in America have been able to cover their wants to better advantage by purchases of American copper re-shipped from China.

As with any staple article, so with copper, a small surplus creates the price for the bulk, and, therefore, at present the price is being called 17¾ to 18 cents, although the most influential producers do not dream of considering a sale at such a price for the time being, and are not likely to for quite some time to come. Consumers are in a waiting attitude, being comfortable for the next few months and seeing no inducement to provide for their future wants very far ahead, at present high prices. The results of such 'waiting contests' between consumer and producer have, as a rule, been disastrous for the producer, except in periods when the markets were artificially supported. If the copper market will continue in its present dullness for another month or two, there is always the possibility of one of the big producers changing his mind and cutting prices in order to accomplish sales, and, if this be done, it is doubtful whether other producers will have the courage of their convictions to hold and accumulate, for the time being, copper at the high level. The fact should not be lost sight of that for quite some time to come the bulk of the copper produced will be needed for home consumption and export, and accumulation of surplus stock will not be any burden to anybody, owing to the fact that surplus stocks were practically exhausted by the end of last year. There is probably no other staple article with as small surplus supplies as copper. The situation in this respect is so serious that in case of a serious accident, or the shut-down of a large producing mine, like the Calumet & Hecla or the Anaconda, for a period of a few months, an actual famine of copper would be possible, if business continues at the present rate.

All experts agree that copper prices in the long run cannot be maintained at the present level, but they do not agree as to the near future of the market. Some of them—and not the least shrewd—confidently expect a continuation of the present price level, as long as business conditions in this country continue as prosperous as they have been for the last three to six months.—X. in New York *Evening Post.*

Copper Coins in China.—The enormous increase in the importation of copper into China recently is due to its unrestricted coinage into one-cent pieces and cash, which operation is virtually under the absolute control of the provincial authorities. While the multiplicity of mints threatens the debasement of the currency of the Empire, the central government leaves the question of production entirely to the viceroys of the provinces. As these officials realize a comfortable margin of profit on the coinage, there is no likelihood of its early cessation, and the extensive copper importation will continue. The Shanghai Chamber of Commerce has investigated this question and has informed the diplomatic corps at Peking that representations looking to the regulation of currency should be made to the government. The chamber pointed out that as the Chinese provincial governments imagine they have a perennial source of income from the profits of the mints, they may fail to grasp the dangers of depreciation because of over-issue. It was further suggested that if restrictions be not established, foreign trade in China must inevitably suffer. In the report of the trade of China and abstract of statistics it is estimated that the output for 1904 approximated 1,745,000,000 of copper pieces and the chamber of commerce declares that by 1906, when all the mints, new and old, are in operation the output will reach in round numbers 16,413,000,000 pieces. There are 18 or 19 mints now in operation in China, but although bankers and merchants have given the subject close study, they find it extremely difficult to obtain through unofficial channels absolutely accurate information as to the present producing power of the various mints established. These conditions indicate a growing demand in China, and it is estimated that the United States now exports to this country practically one-half of all the copper that is used. The American 99.6 electrolytic copper is popular because it can be worked to advantage in the mints, and as their purchases about cover the entire importation it is apparent that the only way to increase the demand for American copper is to decrease the price. Australian copper, sold through British and German syndicates and metal exchanges, is also largely represented on this market. The importation of copper disks or blanks, the same size as the coins themselves, has been prohibited by the Chinese Government for the reason that individuals brought them in and, by using a home-made stamp, more or less crude, but nevertheless effective, established a lucrative industry. These coins circulated freely in the interior, and the authorities found it essential to suppress the competition. The customs authorities will, however, admit copper disks through the custom-house for delivery to government mints on an order from Peking. Such disks are now made in England, Germany, and Japan, and are said to be more profitable for export than ingots. There is also a demand for copper strips 2½ to 3 in. wide, of the same thickness as the coin. These strips are stamped at the mints and placed in circulation, saving time and decreasing somewhat the expense of coinage. In view of the enormous demand for copper, which it seems probable will continue for several years unless unexpected restrictions on coinage should be imposed, it would appear advisable for American copper men more carefully to investigate the conditions than they perhaps have up to the present time. This information can be obtained either through trusted representatives in China or by sending out an expert, and it is believed that the results would justify the outlay in time and expense.

Timber Preservation.—Wood, for structural use, should be cut when the sap is down, that is, in winter. If cut at this season and placed under water, it lasts well. The Poughkeepsie railroad bridge, over the Hudson river, has stone piers that stand on 12 by 12 timbers set on cribbing, all the timber-work being under water and thereby preserved. In the tropics, timber should be cut when the moon is down; if cut at full moon, or when that luminary is rising, the timber will rot in six weeks. This is a fact, for which no explanation is as yet forthcoming.

The Comstock in 1876.

Never since the world began have larger or more valuable orebodies been discovered than were uncovered in the Comstock lode between 1870 and 1876. There have been many great mines in many lands, but none have yet eclipsed what was actually discovered and exhausted on the Comstock. The history of the great lode teems with exciting incidents and romance; Arabian Nights' tales are not more entertaining nor less wonderful than the story of the heroic work accomplished by those modern genii—the Comstock miners.

The lode was discovered, almost simultaneously, at two different points, one at Gold Hill, the other a mile and a half farther north at the Ophir mine. After nearly ten years of somewhat desultory placer mining in Six-mile canyon and Gold canyon, gulches heading at Virginia City and Gold Hill, respectively, the lode itself, which was the source of the placer gold, was uncovered. At the present time the discovery would have been made within a week. At Gold Hill the quartz croppings, soft and crumbling and iron-stained, carried mostly gold, with comparatively little silver, near the surface. This, beyond doubt, would in time have attracted sufficient attention to have eventually given the Comstock the fame it has since enjoyed, but it was the discovery of McLaughlin and Reilly, of the black silver sulphide in the Ophir croppings, that was the immediate cause of the rush to Washoe. These inexperienced miners followed up a poor pay-streak, making barely a living on the steep slope of Sun peak, now called Mount Davidson. Water was very scarce, and to secure sufficient to wash their dirt in a rocker, they dug a small pit where there was a trickling spring, or rather seepage, of water. When this little basin was about four feet deep they encountered a black, granulated, heavy mineral, and, miner-like, panned a shovelful to satisfy their curiosity. The pan of black dirt was washed with difficulty, owing to its high specific gravity, but it yielded, when the black stuff had been dexterously removed, a handful of yellowish-white metal, which they were slow to realize was nearly all gold.

As they stood gazing on this prospect, and speculating on its value, Comstock put in an appearance, astride a small broncho. He caught the glint of metal in the pan, and in a moment was off his horse examining the pannings, and scratching the dirt in the pit with his fingers. Comstock was a man of quick wit and prompt action, though of no education. He realized that something unusual, and possibly of great value, had been discovered. Gazing earnestly at the miners, Comstock gravely informed them that they were working on his ranch. He claimed to have located a farm of 160 acres on that rocky mountainside, where the only verdure was a scattering of stunted sage brush, where there was no water, and but scanty thin soil. It is more than probable that the prospectors failed to realize the value of their find, or they would not have so meekly permitted Mr. Comstock to impose upon them as he did. He was given a large interest in the claim, and an additional claim was staked for his partner, Emanuel Penrod. Comstock talked loud and much about his mine, and in time it became to be known as Comstock's mine, and later, as its magnitude began to be realized, it was called Comstock's lode, and eventually the Comstock lode.

In a few weeks it was learned that the black, heavy sand that had been considered such a nuisance, and had been thrown away, was silver sulphide. The discovery was made through a sample sent to Nevada City, California. Within a day men left on horseback, in wagons, and on foot for Washoe, as the district was called. No small wonder—they were anxious to reach a camp where the miners threw away ore worth from $3,000 to $10,000 per ton.

There are few parallels in the history of mining equalling this rush to Washoe. The stampede to the Kimberley diamond field in South Africa resembled it greatly, but the more recent mining excitements dwindle into insignificance in comparison with either. A city sprang into sudden, though rude, existence on this barren, rocky hillslope in an incredibly short time. It was many miles from any other city; everything had to be freighted into the region over rough mountain roads—food, clothing, and materials of every kind. More than 6,000 ft. above the sea, the wind-swept town of tents, boards, gunnysacks, and old tin cans, presented a strange sight, and was a picture which could not be appreciated if not seen.

Thousands of eager, excited men thronged the streets, the public houses and the hovels, which latter afforded them but little shelter from the weather. Notwithstanding the numerous drawbacks, the camp grew quickly into a flourishing city of 30,000 people, while outlying districts held several thousand more. Theaters, large merchandising establishments, churches, schools, beautiful homes and public buildings sprang up as from the very ground. The hotels were elaborate and were furnished like palaces, the workmen lived and dressed like nabobs, and all went well in those days at Virginia City. For more than ten years the mines of the Comstock lode produced famously. Such orebodies had rarely, if ever, been seen before. Millions upon millions in gold and silver came from those great storehouses of wealth. Some idea of the cause of all this turmoil and frenzy of men may be gained from a statement of production from some of the most noted of the bonanzas. The figures are approximate: In the Gold Hill district the Yellow Jacket produced $25,000,000. Joe Bowers, a claim 20 ft. long, produced several millions, and this claim was afterward consolidated with the Imperial and produced several millions more; Belcher, $40,000,000, this from below 1,000 ft. from the surface; Crown Point, $30,000,000, and others, large amounts. In the Virginia City section, Ophir and Mexican produced about $25,000,000; Gould & Curry, $15,000,000; Savage, $17,000,000; Hale & Norcross, $10,000,000, and Chollar, $13,000,000. Other millions were taken from other mines in the north and central portions of the great lode. Is it any wonder that men and women became frantic in their endeavors to win a fortune while the opportunity was passing?

And yet, the greatest and richest orebodies in this wonderful lode had not been discovered, and their existence was scarcely more than suspected, and that by only a few of the keenest observers. One of these was C. A. Luckhardt. After describing what was known as the South Ophir orebody, he wrote in 1868: "The ground south of this orebody for over 1,300 ft., including south portions of the California Company, Central No. 2, Kinney, White & Murphy, Sides and Best & Belcher, has been lying idle for years. It was explored to various depths, from 100 to 500 ft. below the surface, but never with any system; and nothing can be said of its value. It is very probable that much ore exists there, but it has not yet been laid open to view. A shaft, now 300 ft. deep, is being sunk with the object of thoroughly investigating the ground for ore." The ground here described by Mr. Luckhardt covered the great bonanzas of the Consolidated Virginia and California mines, which a few years later surprised the whole world with their vast output of gold and silver.

It is impossible here to describe the legal complications over these mines, the physical conflicts of the miners with scalding water or caving ground, and the unusual engineering problems of many kinds. But mention must be made, though briefly, of the invention of the square-set method of timbering, which was evolved on this lode in the Ophir mine by Philip Deidesheimer, who was employed by the Ophir Co. to devise some means by which they might in safety extract their ore. For the first 60 or 70 ft. the vein was small, and rich, and offered no unusual obstacle to mining by ordinary methods, but at 175 ft. the vein had widened to a mass of crumbling quartz and silver sulphide 65 ft. wide. The miners had exhausted every resource; they had spliced long timbers together, and were endeavoring to stope the ground, but it was found impossible longer to continue this dangerous method. Mr. Deidesheimer visited the Ophir mine and inspected the workings. It was evident at once to him that the orebody could not be extracted by methods commonly practiced Pillars were impossible, as the ore was too soft and crumbling to sustain their own weight. He determined to drive a crosscut from wall to wall. This was done, and the cutting was timbered with posts and caps, but the caps, instead of crossing the opening from side to side, were laid on a line normal to the strike of the vein, thus forming on both sides a continuous line of caps from foot to hanging. Having successfully accomplished this, a second crosscut was cut by the side of the first, and a third line of posts and caps was set up in like manner. The sets were spragged with pieces of 2 in. by 4 in. scantling, but it soon became evident that something more substantial was required; accordingly, the 2 by 4-in. sprags were replaced by 'ties' of the same dimensions as the posts and caps, but as the caps, which met on top of the posts, occupied all of the space on the posts, the ties were supported by iron lugs driven into the posts at a proper height. A raise was now made near the center of the vein, where the ore was particularly rich. As soon as the excavation was sufficiently large, posts and caps were required. As the posts, if set flush upon the caps of the first set, would be insecure, mortises were cut in the caps after they were in place, and the posts were provided with tenons to fit into them. A few sets were inserted in this manner, when it was concluded to frame the timbers so that when in place a mortise would be formed at the point of their union. When this had been done, the square set, which has made possible the safe removal of an orebody of any size, was practically complete. The sills, butt-caps, anglebraces, and other parts of the square-set system as now known, came later, the entire system being evolved as the necessities of the case required.

It is of interest to know that the first engine on the Comstock lode was erected at the Ophir mine. It was rated at 15 h. p. and was used to run a small pump. It forms an interesting contrast to the magnificent installations which have since been built on the lode.

There is a well-founded report that early in the 70's, while James G. Fair was superintendent of the Savage mine, he had a drift run westerly from the 1,000-ft. level of that mine into the foot-wall country, and thence by a circuitous route through the Gould & Curry and Best & Belcher mines into the Consolidated Virginia—the ground described by Mr. Luckhardt as possessing great possibilities. Here the crooked drift encountered promising indications and then good ore. Unexpectedly the order was given to abandon the drift, to draw the timbers and allow it to cave, ostensibly because it was too poor to mine. The four men, Mackay, Fair, Flood and O'Brien, who afterward became the most noted of all the notable men on the Comstock, had already formed their famous coalition; quietly they began to buy up the shares of the Consolidated Virginia and California mines, a procedure requiring not only abundant money, but much shrewdness and finesse. It has been stated that the control of these mines cost the firm about $50,000, and control usually meant complete ownership in those days. When they had secured the management of the coveted mines, which required nearly two years, they attacked the problem of their development with vigor. The old Consolidated Virginia shaft was sunk as rapidly as skill and money could drive it, and simultaneously a drift was started from the Bonner shaft of the Gould & Curry, at the 1,167-ft. level, and was driven with all speed through that ground into, and through, the Best & Belcher, and into the Con. Virginia, where about 150 ft. from the line a small vein of ore was encountered. The drift was continued, and in 30 ft. the seam had widened to seven feet of high-grade ore. Further exploration proved the vein to continue and to grow both larger and richer. The shaft also penetrated the same orebody. Levels were run and sinking continued. More, and constantly more, ore was brought to light, and as level after level was run and the orebody blocked out, it began to look as if there would be no limit to the size and value of this phenomenal mass of silver-gold rock.

For more than two years the development of this, the greatest orebody in the world, continued. Millions of dollars had already been taken from it, and unknown millions remained. On one level this great mass of ore was over 350 ft. wide. It was several hundred feet high, and more than 1,000 ft. long. From it was extracted, by official report, by the first milling, over $130,000,000. This was the 'Big Bonanza.' Later another orebody, known as the Little Bonanza, was found near the first, from which $25,000,000 was taken. Over 1,400,000 tons of tailing, up to 1882, were worked over three times, and some of them are being again worked for the fourth time, now with the cyanide process, by Charles Butters.

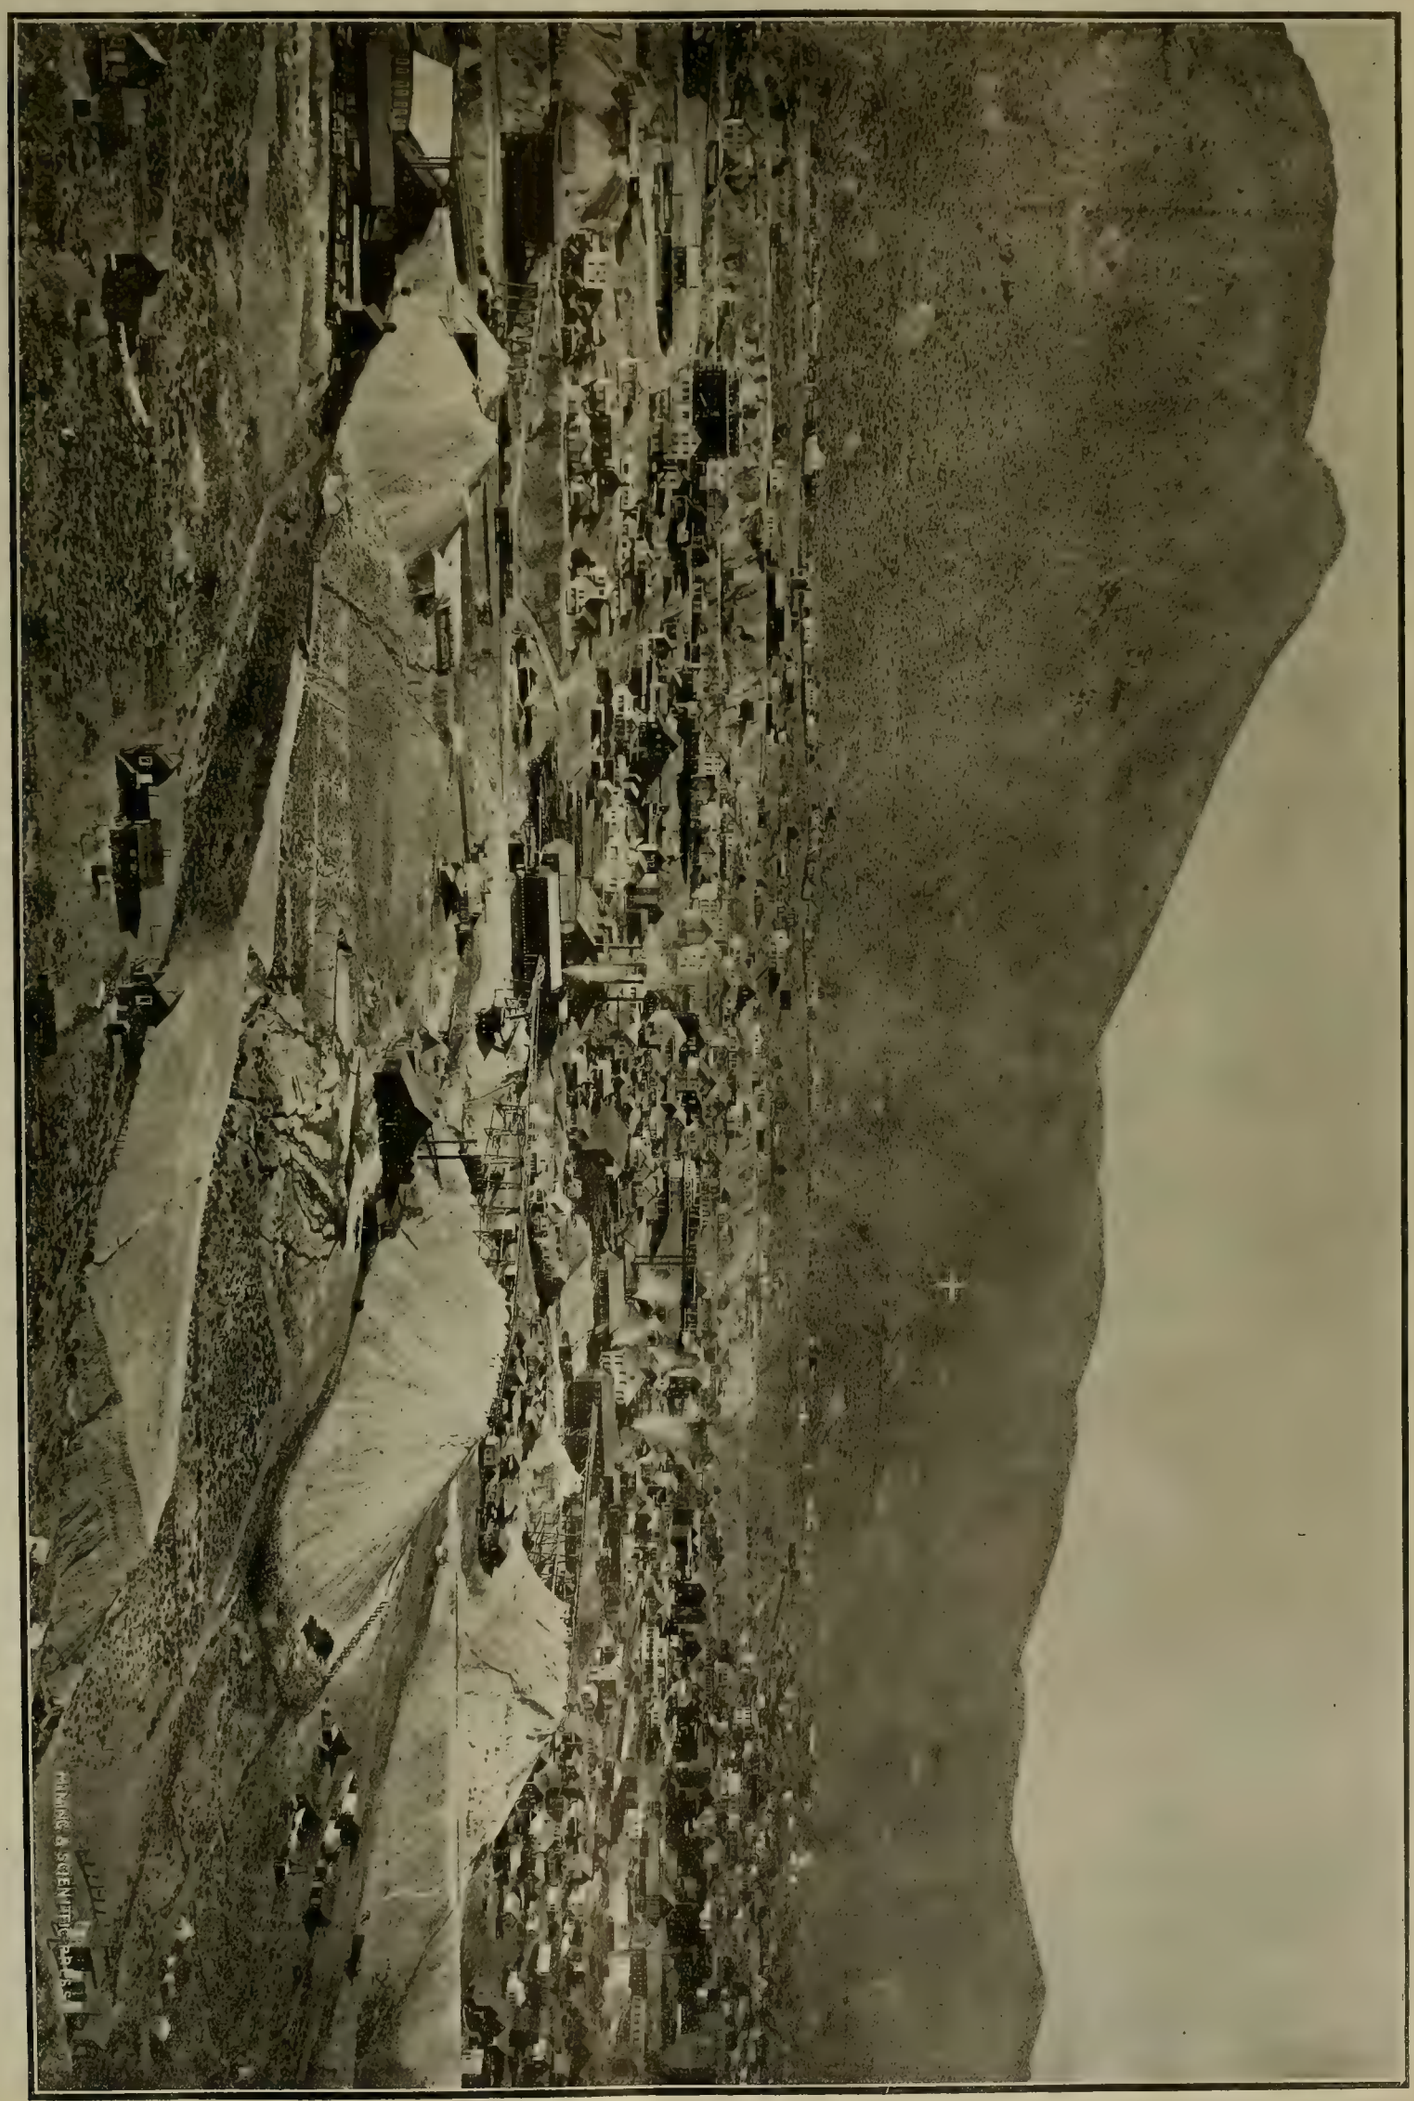
In 1875 Virginia City had grown to a substantial town, with many handsome buildings, but it did not escape the fate of most other mountain mining towns, and on October 25, 1875, a fire swept the greater portion of the city out of existence. With it went many of the elaborate hoisting and milling plants.

The illustration on the opposite page is from a photograph of the central portion of Virginia City taken about one year after the great fire. It shows a better, larger and more substantially built city than that which was burned—a tribute to the enterprise and energy of its citizens.

Several of the more prominent buildings can be seen. The nearer mines are the Hale & Norcross, Savage, and Chollar. The white cross on the mountainside is 'Point A,' the datum to which all important measurements on the Comstock have been referred. The gulch to the right of the cross is Spanish ravine. It was just this side of the ravine where the uppermost houses are seen that the Ophir discovery was made. The Consolidated Virginia and California mines are just beyond the limits of the picture on the right.

RADIO-ACTIVITY.—It is a fact that the fluorescent effects of the Rontgen rays incited Becquerel to his examination of uranium, and led to his discovery of its radio-active properties; and from this to the isolation of radium by M. and Mme. Curie, and to the splendid series of researches which have been carried out on that substance and on other allied substances, the way is clear. Rontgen's discovery was made only 10 years ago, and it is a marvelous illustration of the large sum of human effort applied to the study of science, and of the active, one might almost say the radical, tendency of the modern mind, and in so short a time we have obtained so great a body of established knowledge, and experienced so complete a revolution in our most fundamental modes of scientific thought.—*Science.*

THE COMSTOCK.—Our illustration of Virginia City is borrowed from a set of magnificent photographs of the Comstock, taken in those early days by the noted old landscape photographer, C. E. Watkins, whose beautiful pictures of Yosemite, the Big Trees, and other famous scenic points on the Pacific Coast have attracted world-wide attention. These Comstock pictures are what were known as silver prints. They are deep in tone, rich, and clear. The famous photographer, now grown old and deprived of his eyesight, lives in seclusion and poverty in San Francisco. Recently he had made for Clarence Mackay, at the latter's order, a set of handsome photographs on glass, showing the great works of Virginia City and many characteristic scenes on the Comstock when it was in the height of its glory. Copies of these photographs may be had by those who desire this pleasant reminder of the early days.



THE COMSTOCK IN 1876.

Virginia City, with Mt. Davidson in the Background. Cholar, Hale & Norcross, and Savage Mines in the Foreground.

Pyrite Smelting Without Coke.

Written for the MINING AND SCIENTIFIC PRESS by LEWIS T. WRIGHT.

From prehistoric time, copper has been extracted from cupriferous pyrite by a fire treatment consisting of alternate roasting and smelting with carbonaceous fuel and fluxes. Each roasting oxidized a portion of the sulphur and iron and each smelting removed, as iron slag from the copper sulphide, the iron oxidized in the previous roasting process; and these alternating operations were continued until a nearly pure copper sulphide was left; such copper sulphide by melting and oxidation finally became the refined metallic copper which was the aim of these combined processes. The treatment of the ore therefore was one of elimination, in stages, of sulphur and iron, and finally the sulphur; it was a gradual scraping away of the husk and chaff to find the valuable grain.

The successive oxidations and smeltings were carried on with the aid of carbonaceous fuel, which, by its reducing action, is counter-active to an oxidizing process.

Let us review for a moment the so-called English method of smelting cupriferous pyrite:

1. An ore (say 5%) is roasted in a reverberatory furnace with the aid of 15% its weight of coal.
2. The roasted ore is then smelted with the necessary flux, thereby cutting out, as slag, the iron oxidized in No. 1. This smelting is carried on with the aid of 40 to 45% coal and leaves a 35% copper matte or coarse metal.
3. The 35% matte is roasted in a reverberatory with the aid of 40 to 45% coal.
4. The partly oxidized 35% matte from No. 3 is now smelted with the aid of 50% coal, again cutting out, as slag, the iron previously ozidized; this leaves a 75% matte.
5. This 75% matte (white metal) is melted in a reverberatory furnace and by a succession of oxidations and reductions, in which the oxidations prevail, is now freed of its sulphur, leaving 'blister copper.' This is done with the aid of 60% coal.
6. The blister copper is refined by a succession of partial oxidations and reductions to fine copper.

The practice of large-scale copper smelting in the United States quickly resulted in the use of blast furnaces and converters, and by 1895 the old cumbersome, laborious and fuel-consuming method had been largely abandoned in favor of more rapid (and more economical) treatment. The coarse sulphide ore was often roasted in heaps with a little cord-wood and the fine ore was roasted in mechanical furnaces, especially if in the form of concentrate, with a not inconsiderable proportion of fuel. The smelting of the roasted ore in the blast-furnaces was effected with a quantity of coke equal to about 10% of the weight of the charge, producing a 40 to 45% matte, which was brought up to blister copper in the converters, without the expense of further fuel, except that required by the blowing engines. The sulphide fine, after roasting, was briquetted and smelted in blast-furnaces or smelted direct as a hot calcine in reverberatories. This last method offers advantages in localities where suitable fuel can be obtained at a low cost and where the ore is naturally fine.

At Keswick frequent attempts were made to smelt the sulphide ore (which was pyrite with some chalcopyrite), with hot blast but at first without increase of economy.

The coarse ore was, therefore, roasted in heaps or kilns and a smelting charge of the following average composition was made up for the water-jacket blast-furnaces:

Calcined ore	49 5%
Cupriferous pyrite	12 3%
Raw matte	8.1%
Slag	7.6%
Fluxes	22 5%
Coke	9.3% of total burden
Grade of matte produced	42.0%
Rate of running	5 49 tons per sq. ft per 24 hr.
Blast	22 oz.

This charge at first ran with extreme difficulty, the furnaces chronically and promptly freezing up. The difficulty was wrongly attributed at the time to the presence of a small amount of zinc in the ore, and it was recommended by the metallurgist then directing the smelting operations to crush the ore, to roast it in mechanical furnaces and to smelt the product in reverberatory furnaces. An adoption of this recommendation would have entailed the reconstruction of the smelter.

When I took charge in the beginning of 1897, I discovered that the cause of the difficulty was due to the top of the charge being held too low in the shaft of the furnace and on carrying the charge a little higher the trouble immediately disappeared.

The normal charge was calcined ore only and the sulphide in the above average represents occasions when by especially good roasting of the coarse ore the grade ran up beyond that required, and sulphide ore was added to the charge to bring the matte down to the normal grade. In the reverse manner, if the coarse sulphide had not been so well roasted, the grade of matte fell below the normal and had to be re-treated; and thus raw matte appears in the average charge.

The furnaces ran with remarkable regularity and ease; but the heap roasting was an unsatisfactory feature. The fine sulphide had to be roasted in mechanical furnaces and briquetted. Occasionally, when the supply of calcined ore ran short, all-pyrite charges were run; but always with the production of a low-grade matte that required two or three re-smeltings to be brought to the normal grade, of 40 to 45%. No attempt was made at that time to reduce the coke on the pyrite charges and the operation was, therefore, not economical; it seemed that, owing to the inability to secure a reasonable concentration, the all-pyrite smelting could not become an economical practice. Later, the roasting of the coarse sulphide ore was entirely abandoned and the fine sulphide was roasted perfectly and a mixture of coarse sulphide (pyrite) and well roasted fine sulphide enabled a 40 to 45% matte to be produced economically.

Other attempts to run all-pyrite charges, this time again with the aid of hot blast, did not succeed, owing to the old difficulty of low concentration; and when the coke was reduced to about 3% the furnaces quickly closed up with obstinate accretions. The practice of running all-pyrite charges was abandoned at that time, chiefly owing to the unsatisfactory oxidation of the charge. Many mistakes, as afterward discovered, had been made in the make-up of the charge; among other evils, the furnaces were overloaded with slag.

The first attempt at all-pyrite smelting failed because it was not then realized that the coke then being used could be reduced and that, being counteractive to oxidation, its presence prevented the required concentration of the pyrite into high-grade matte. With 9 or 10% coke on a charge of pyrite, a 12 to 15% copper matte ran through the furnaces like water. Being intensely hot and liquid, the ganister and fire-brick lining was eaten away and the hot, low-grade matte was frequently bursting out from the furnaces, producing explosions. The amount of air in the blast was only sufficient for the combustion of the coke.

When the first serious attempts were made to run all-pyrite charges with hot blast, with only the amount of coke absolutely necessary to keep the matte and slag running, a charge was made up, of which the following are two examples:

Cupriferous pyrite	58.7%	60.0%
Raw matte	4.3%	3.2%
Fluxes	16.6%	10.0%
Slag	20.4%	26 8%
Coke in charge	3 0%	3.5%
Copper in matte	18.7%	18 7%

The runs were of short duration because in from 5 to 10 days the obstinate accretions threatened to close up the throat of the furnace entirely and, to prevent a freeze up, the charge was modified.

It must be admitted frankly that the above-mentioned attempts at all-pyrite smelting were purely empirical and in no sense founded upon scientific reasoning. Had the experiments been varied as regards the proportion of inert heat-absorbing slag, reducing this to a minimum, no doubt it would have been then and there demonstrated that such charges would run entirely without coke and the concentration would thereby have been somewhat better. But those were not our scientific days of pyrite smelting.

However, the advantage of hot blast in the case of a composite charge of coarse sulphide and well-calcined fines was abundantly proved, and hot blast was adopted for all the furnaces. It was immediately seen that the hot blast, other conditions being equal, enabled the furnaces to run one-fifth faster with the use of one-fourth less coke and produced 25% higher grade matte. This was the result of being able to take off from the charge so much de-oxidizing carbon.

The composite charge of sulphide and well-roasted fines was then smelted with hot blast in a two-stage process. The first-stage furnaces carried the following average charge:

Calcined ore	26.1%
Cupriferous pyrite	35.5%
Flue dust	9.7%
Slag	14.5%
Fluxes	14.2%
Coke in charge	4 % of total burden
Copper in matte	31 %

This matte was re-smelted with some sulphide and calcined fine ore in a charge, of which the following is typical:

Calcined ore	31.4%
Cupriferous pyrite	8 7%
Raw matte	26 7%
Slag	13.3%
Flux	19.9%
Coke in charge	5.3% of total burden
Copper in matte	53.5%

The final average charge of all the furnaces, both first and second stage, was now:

Calcined ore	23.8%
Cupriferous pyrite	24.9%
Raw matte and flue dust	14.7%
Fluxes	17 3%
Slag	14.3%
Coke in charge	5 2% of total burden
Copper in matte	53.5%
Rate of running	8 tons per sq. ft. of furnace area per 24 hr
Blast	28½ oz

It will be seen that a notable economy of coke had resulted. The make-up of the charge on all furnaces was one that produced the smoothest running. Long campaigns were the rule. The rate of driving had increased. This was partly due to the increased blast pressure and partly to its increased temperature.

During the attainment of these results I had been endeavoring to secure some information respecting the necessary and minimum heat requirements of a copper-smelting furnace, and to ascertain the minimum amount of pyrite that must be oxidized in a given time in such furnace to furnish the heat requirements. It was evident that the amount of air required was necessarily more than that which we are in the habit of calling the 'theoretical,' meaning that which would be required to furnish the amount of oxygen indicated by the equation FeS_2 plus 5O equals FeO plus $2SO_2$, because thatre-action would cease when the tension of the SO_2 reached a degree much inferior to that indicated by the equation. Finally I became convinced that the calorific value of pyrite as a fuel was sufficient for its self-smelting; again, I made attempts to run pyrite charges without carbon fuel, but invariably failed, because of the incredulity of my staff, who were firmly convinced from past failures that it was impossible.

Finally, to convince those operating the furnaces and to induce them to effect the required result of their own volition, it was decided to order it to be done and forbid the use of any coke in the charge except that needed for starting the furnace, it being understood that if the furnaces froze up the general manager would hold himself responsible, and that the crew could have the fun of digging them out.

As a result it was quickly demonstrated that pyrite *could* be smelted without coke and monthly furnace runs with an average consumption frequently of only 0.1% coke and lower, which coke was only required to start the furnace, became the practice with a charge made up as follows:

Cupriferous pyrite	74 3%
Flue dust	9.0%
Slag	2.8%
Fluxes	13.9%
Coke in charge	0.32% of total burden.
Copper in matte	26.8%
Rate of running	8.75 tons per sq. ft. furnace area.

If it had been then convenient to convert this grade of matte direct to blister copper, the smelting might have easily stopped there. The matte resulting from this charge was, however, all re-smelted in a charge of the following composition:

Calcined ore	8.8%
Raw matte	19.4%
Cupriferous pyrite	31.1%
Flue dust	6 4%
Slag	18.4%
Fluxes	15.9%
Coke in charge	4.3% of total burden.
Copper in matte	41.8%

The average of all furnaces was:

Calcined ore	4.3%
Cupriferous pyrite	51.5%
Raw matte	10.6%
Flue dust	6.3%
Slag	11.9%
Fluxes	15.4%
Coke in charge	2.7% of total burden.
Copper in matte	42 0%
Rate of running	8.83 tons per sq. ft. furnace area.
Blast	32.2 oz.

The smelting of pyrite to 27% matte had therefore been finally carried out in blast furnaces on a large scale without the aid of coke. So far, attempts to carry it along, without the use of heated blast, have failed. It will be noted that the furnaces run very fast; that is apparently one of the conditions of success. The amount of fuel used in heating the blast is equal to about 1 to 1¼% coke.

It now having been fully demonstrated that the furnaces would run without coke with a sulphide charge of the right composition, efforts were made to force the concentration so as to produce a 35% matte in the first stage and to convert this to blister copper direct without the intervention of a second smelting stage, and to smelt the fine sulphide direct without preliminary calcination and bricking, which latter process is very expensive.

This object was achieved, but the one and only smelting stage had then to clean all the converter slags and work up all the fine sulphide ore, the flue-dust and the furnace cleanings; therefore the average furnace charge of sulphide ore became somewhat diluted to:

Cupriferous pyrite, including fine	65.6%
Flue dust	8.0%
Slag and furnace cleanings	12.1%
Fluxes	14.3%
Coke in charge	1.8% of total burden.
Copper in matte	33.7%
Rate of running	8.75% tons per sq. ft. of furnace area.

Though the furnaces would often run without coke, the slightly heavier burden of inert material and lessened amount of sulphide ore on the charge seems to necessitate the occasional use of a trifling amount of coke. However, the operation, being reduced to one stage of smelting, is much simplified, and the lower grade of the matte adds but little to the cost of the converting department, and there is the advantage that the whole of the slag is discarded at the lowest tenor of copper, and that the whole of the fine sulphide ore is smelted without previous calcination and bricking.

The two great difficulties in the practice of pyrite smelting are the obstinate and rapidly forming accretions, tending to close up the furnace, and the low-

grade matte produced. In reviewing any average of charges it is always seen that the consumption of coke varies inversely as the percentage of sulphide ore. Broadly, the addition of each 25% sulphide ore in the charge with hot blast is equal to a reduction of about 2.5% coke. The calorific value of carbon is a little more than four times that of FeS , burned to FeO and SO_2, and yet it requires ten times more pyrite than coke to keep up the smelting temperature in the blast furnace.

The following average results of large quantities smelted in several furnaces will illustrate the relative practical values of pyrite and coke in smelting:

HOT BLAST.

Percentage of pyrite on charge.	Percentage of coke.	Percentage of copper in matte.
21 9	5 2	53 5
32 1	5 1	52 4
45 7	3 4	46 3
51 5	2 7	42 0
58 5	2 3	39 6
74 3	0 3	26 8

The calorific value of one unit weight of carbon burning to CO_2 is 8.08 calories; that of a unit of pyrite or FeS_2 burning to FeO and $2SO_2$, I have calculated as 1.976 from a statement that has been made by Schnabel* that the heat of combustion of FeS_2 oxidized to Fe_2O_3 and $2SO_2$ is 2.253. This result appears to be high if that of FeS to FeO and SO_2 is correctly given in the text-books at 1.29 calories (113.6 calories per molecule).

Pyrite as a fuel has two disadvantages. Firstly, its sulphur will only burn in the presence of an excess of oxygen. This necessary dilution lowers the temperature of combustion. Secondly, its sulphur burns in a fractional manner or in three stages. On first heating, one-third of the sulphur is lost and Fe_3S_4 is left. On further heating, FeS is formed with the loss of one-sixth of the original sulphur. The loss of one-third of the sulphur at a relatively low temperature on the top of the charge is the cause of the 'hot top' so troublesome in pyrite smelting. This sulphur burns on top of the charge, and while it adds something to the temperature of the freshly charged material, it is not as efficient as if consumed lower down in the furnace or in the smelting zone. One-sixth of the sulphur is evolved between the period of the formation of the Fe_3S_4 high in the furnace and that of the matte, and must be consumed at some point lower than the first third. The FeS is now free to burn *en bloc* in the smelting zone. This long-drawn out and fractional combustion while lowering the temperature of combustion is also the cause of the troublesome scaffolding—the accretions formed of pieces and particles of the charge which, being externally semi-fused, build up from the side a dense mass of unfused material through which the blast cannot penetrate.

The other disadvantage of pyrite as a fuel is that its sulphur will not burn unless a certain *excess* of free oxygen be present. FeS is stated to have a heat of combustion of 1.29 calories, which is equal to 0.95 calorie per unit weight of the origiual pyrite. If the pyrite charge had only to depend upon the heat of combustion of the FeS which results from the melting of pyrite, the practical result (given above) that the oxidation of an amount of FeS_2 equal to 50% of the charge enables the smelting process to go on, by itself so to speak, can be compared with coke in the following way: Five-tenths of a unit weight of FeS_2 burning as FeS at 0.95 calorie equals 0.475 calorie per unit weight of charge. This is equal to 0.059 carbon or 0.071 coke with 83% carbon; in other words, the FeS component of pyrite consumed should, by a comparison of the respective heats of combustion, be equal to 7.1% coke on the charge. It would, therefore, appear from practice that the easily freed sulphur of the pyrite is not of much value as a smelting fuel.

The development of only a few years has revolutionized copper smelting, reducing it to an almost absolutely automatic process in which three agents are required, that is, cupriferous pyrite, flux and heated air. With a properly balanced supply of these three agents, the oxidation and slagging off of the iron can be accomplished in two stages and with one continued heating, and in a couple of hours the copper can be separated as blister copper from cupriferous pyrite. The ancients could only have achieved this, either empirically or by accident. They did neither. The moderns certainly should have been able to achieve it ere they did, because the results of chemistry or physics, if properly applied, would long ago have demonstrated the limits within which the process of pyrite smelting was possible.

GRAPHITE varies considerably in specific gravity—from 2.09 to 2.23—according to the amount of impurities. The hardness also varies for the same reason from 1 to 2. Graphite has a metallic luster when pure, and varies from this to dull and earthy, according to the percentage of impurities. The color for the same reason also varies from iron black to dark steel-gray. It has a greasy feel, is a conductor of electricity, is impervious to atmospheric influences, is combustible only at very high temperatures, and is very soft. It is these properties of graphite that make it of so much value in the arts and adapt it to such a large variety of uses.

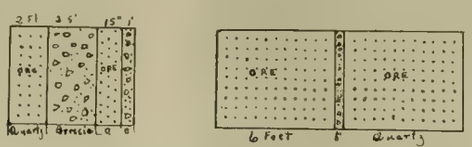
Fault Breccia Veins in the Sierra Madre.

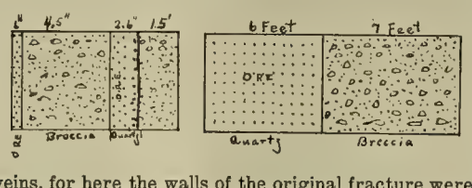
Written for the MINING AND SCIENTIFIC PRESS by RUFUS M. BAGG.

There is a type of vein formation widely distributed in the mining regions of the high Sierra Madre of Mexico which is worthy of special description. They may be designated 'fault breccia veins,' for they occupy a distinct position in the classification of ore deposits. The origin of these veins is two-fold and they are really a combination of the fissure and fault types which have been subject to extensive deformation after deposition along defined shear-zones. The classification of mineral deposits given by Kemp in his book on ore deposits includes under 'Solution Deposits' No. 6 "Veins occupying shear-zones or dynamically crushed strips along faults," as at Butte, Mont. To this class belong some of the veins of Boulder county, Colorado, described by me in the *Engineering and Mining Journal* in 1903, where, owing to irregular fracture in a homogeneous porphyritic rock, successive layers, or rather lenses



(pockets of the miners), were formed by infiltration of gold-bearing solutions. This infiltration of quartz is limited in width and thickness to the amount of space left vacant between the irregular fracture line through horizontal shear. Such conditions resulted in alternate layers unevenly distributed at various depths, roughly like the slightly overlapping scales of a fish.

Such examples are entirely different from the peculiar mineral-bearing lodes of the Mexican mountains, if we have rightly interpreted the origin of these



veins, for here the walls of the original fracture were first opened as a simple fissure along a more or less regular line. This fissure was filled with mineral-bearing quartz solutions, which became solidified and possess well-defined walls. At some later epoch, which probably came at a long interval after the first disturbance, since the successive eruptive flows vary so widely in composition and structure, very extensive faulting took place along the same disturbed lines. When this intensive movement occurred the original solid quartz was either pushed to one wall (I have found this quartz ore-bearing on both the foot-wall and the hanging in the same mine, but with the crushed portion of the breccia completing the vein-filling first on one side and then on the other), or it was split into two or more parts, with the brecciated eruptive porphyry thrust in between, or, more rarely, when the quartz vein was narrow the quartz became broken and was carried along into the breccia portion of the vein. While professional obligations will hardly allow me to mention the particular mines I have in mind while writing this article, still I give a few general sections of vein-structure illustrating this point. These are not theoretical deductions, but are exact examples of measured veins in some mines which are found in the southwest portion of the State of Chihuahua, and these conditions are by no means rare in the mountains of northern and western Mexico.

The slight mineralization of the breccia becomes more pronounced when the vein has greater width, although in most places the gold and silver are practically confined to the quartz of the vein proper.

To one unfamiliar with the character of the mines in the State of Chihuahua, it is rather surprising to see how intense has been the faulting. In many instances, as at the Reina silver mine, 14 miles south of Cusihuirachic, the slickened wall west of the ore-bearing vein stands like masonry to a height of some 50 ft. and shines like polished marble. It is not claimed by me that this vein structure is not known already, but the two-fold origin of marked brecciation along already mineralized belts is extremely interesting and instructive. This same condition has been observed in the Needle mountains of Colorado, and it has presumably a wide distribution elsewhere, but I believe that it is best illustrated in the high Sierras, where extensive faulting has taken place.

HENRY CLAY is said to have bitterly opposed the appropriation for the Sault Ste. Marie canal, on the ground that the money would be wasted. During the fifty years since the canal first went into service, the traffic has increased from 14,503 tons to the maximum of 36 million tons per annum, having a value of $355,000,000.

The Prospector.

Enquiries sent to this department are answered free of charge, if submitted by subscribers who are not in arrears. The full name and post-office address of the sender must be given, otherwise no answer will be made. Those who are not subscribers must accompany their questions with a fee of $3 for each question. No assays are made.

The mineral sample from Dyer, Nev., is calcite.

The rocks from Fort Churchill, Nev., are: No. 1, hematite (iron oxide); No. 2, brecciated jasper.

The rock from Wisdom, Mont., is a gneissic granite, containing a little white mica and altered hornblende.

The ore from near Hillside, Ariz., is magnetite (magnetic iron oxide). It is not well adapted to use as a flux, but is occasionally used for that purpose in small amount.

The rock samples from Tombstone, Ariz., are: No. 1, a very much altered granite, consisting of quartz, orthoclase, feldspar and biotite mica. No. 2 is fragmental material, largely composed of iron-stained clay.

The rocks from Copala, Sinaloa, Mexico, are: hanging wall, diorite; foot-wall, diabase. The gray rock probably the altered diorite. It contains much silica and finely disseminated iron sulphide. The rock accompanying these, and from Salvador, C. A., is diorite-porphyrite.

The interesting minerals sent from Manvel, and said to be from Soda Lake and Silurian camp, San Bernardino county, Cal., have been determined as follows: No. 1, clinochlore, a silicate of alumina and magnesia. The blue mineral mixed with the yellowish-green is chrysocholla (copper silicate). No. 2 consists of several minerals. Among them are recognized wulfenite (molybdate of lead), a bright orange-yellow mineral; chalcedony, a hard, bluish-white quartz. This is the hard portion of the white scale attached to the yellow ore. Crystallized carbonate of lime (calcite) also forms a part of this crust. No. 3 is a silicious rock, containing copper sulphide (bornite) and chrysocholla (blue). No. 4 consists principally of iron oxide (limonite), both the dark-brown and the yellowish-brown minerals. The white portion is calcite (lime carbonate). No. 5 is both hard and soft hematite. It may contain gold. No. 6 is a volcanic rock (andesite), slightly stained with copper carbonate. No. 7 is a variety of serpentine (pectolite). No. 8 is tremolite. No. 9 is diorite porphyrite. No. 10 is amphibole. No. 11 is an intimate mixture of quartz, garnet, clinoclore and iron oxide, with a little copper silicate. No. 12 is dolomitic limestone.

TUNGSTEN.—Tungsten has become of renewed interest within the last five years, owing to its wide and successful application for the manufacture of so-called self-hardening rapid tool steels. Its chief ores are wolframite, $FeWO_4$, in which some of the iron is often partly replaced by manganese, hubnerite, $MnWO_4$, and scheelite, $CaWO_4$. The ore most suitable for the production of the metal is wolframite. Although found in many places, such as Queensland, New South Wales, Straits Settlements, Bohemia, Cornwall, Spain, U. S. A., &c., it does not occur in large masses, and is often very pockety. In the pure state it should contain over 70 per cent. WO_3, but such ores are not plentiful, and the average grade runs between 60 to 70 per cent. tungstic acid, WO_3. The presence of wolfram in the tin ores at one time caused great trouble, and although Oxland in 1857 found a convenient method of separating these two metals by means of fusion with sulphate or carbonate of soda, which rendered the WO_3 soluble as Na_2WO_4 and left the tin behind, it was not until the system of electro-magnetic separation was applied to those mixed ores that the problem was satisfactorily solved. The ores, whether dressed in the ordinary manner or electro-magnetically separated, should be as free as possible from tin, arsenic, sulphur, and phosphorus, otherwise these impurities are apt to find their way into the metal made from them. The ore is sold on the basis of its WO_3 contents. At the present moment it is worth in London about 25s. to 27s. per unit of WO_3, thus a 65 per cent. ore is worth about $425 per ton. The prices of ore have varied in an extraordinary manner; at one time it could be bought for $75 per ton, and last year it went as high as $750 per ton. With regard to scheelite, this mineral is a white heavy mineral, named after the Swedish chemist Scheele, who first found tungstic acid in the same. As it is not quite so suitable for the manufacture of tungsten metal, it has a somewhat lower value than wolframite, although, if pure, it contains well over 70 per cent. of tungstic acid, not infrequently as much as 74 to 75 per cent. The world's production of wolfram ores is about 3,000 tons per annum, based on 60 to 65 per cent. ore; Queensland seems to have been the chief producer in 1904, with 1,538 tons, valued at $808,175; next probably come Spain and Portugal, with about 400 to 500 tons.—O. J. Steinhart, *Trans. Inst. M. & M.*

The Physics of Ore Flotation.

By J. SWINBURNE and G. RUDORF.

Concentration of sulphide ores by flotation was introduced by Potter in 1901, though concentration by means of oil had been already invented by Elmore. Since Potter brought forward the idea of concentration by flotation other inventors have been at work in the same direction.

Concentration by flotation is carried out by treating the crushed ore with a suitable solution, such as a strong solution of acid sodium sulphate, at a suitable temperature, which is near the boiling point of water. Part of the ore then rises to the top, and is skimmed off, or otherwise separated, and this forms the concentrate.

The explanation generally given is delightfully simple. It is said that the acid liberates hydrogen sulphide from the sulphides, and the gas then sticks to the particles and carries them up. As the acid does not act on the gangue, which in such cases is largely silicious material, the gangue is not carried up; and thus the separation takes place.

This theory does not fit the facts. In the first place, the sulphides generally treated are not attacked by the acid solution, so that there is no hydrogen sulphide evolved; or, at most, it is given off in very small quantities, which are out of all proportion to the amount of material floated. The sulphides of zinc, iron and manganese alone are attacked at all by dilute acids. It cannot, therefore, be the hydrogen sulphide that carries up the particles of sulphide. On the other hand, there is a considerable evolution of gas, but it is carbon dioxide, and carbon dioxide is chiefly given off by the gangue, which generally contains calcite and other carbonates, the carbonates being mostly produced by the weathering of the sulphide particles. According to the theory just given, this action, contrary to what is actually found to be the case, ought to float up either the gangue as a whole, leaving the sulphides, or it should at least float up the carbonates. The next point is that in most cases flotation does not take place at all until the temperature approaches the boiling point.

It seems probable that the whole matter is mainly a question of capillarity, or rather of adhesion and surface tension effects.

Consider first the capillary attraction of the solution, or the adhesion between the solid and the liquid. This phenomenon is a little difficult to examine with surface tension also coming into play. The commonest example is the case of a barometer whose tube has been well boiled, so that there is no air or other gas in the Torricellian vacuum, only mercury vapor. If the barometer is held slanting, so that the mercury runs right up to the top, it may then be put into its vertical position, and the mercury will remain at the top. The liquid mercury is then actually under considerable tension, and, in so far as it is above the barometrical height, the mercury is supported by its adheslon to the glass, which it cannot leave. This instance is particularly to the point, because it is often supposed that mercury has no adhesion to glass, which is a mistake. It also shows that mercury has considerable adhesion to itself, or, as it is usually called, cohesion. Liquids have in this sense astonishing tensile strengths—if such a term may be used. Water will stand a pull of five atmospheres. Berthelot filled a clean tube nearly full of water and sealed it up with a small air bubble. He then heated the water; and under the pressure it dissolved all the air, but on cooling the air did not again separate out; the water occupied the whole space. It must, therefore, have been under a pull in all directions great enough to increase the volume of the water; and this force was borne by the adhesion of the liquid to the internal surface of the glass, together with its own cohesion. This shows that under certain circumstances the force of adhesion between the water and glass may be very great.

Surface tension depends on the liquid itself. It is, of course, concerned with the surface of separation of a liquid and a gas; but we may treat it, to adopt the old idea, as if the surface of the liquid were always in tension like a stretched membrane, except that the tension remains the same whether the surface be increased or diminished.

If a rod is held vertically, partly in a liquid, the adhesion will tend to make the liquid run up the sides of the rod. This movement will be opposed by gravity on the one hand and surface tension on the other. Gravity, of course, tends to keep the surface of the liquid quite level, so that it meets the rod at right angles. Surface tension, considered by itself, tends to keep the surface of the liquid as small as possible, the volume, of course, remaining constant. Thus, if the adhesion, in spite of gravity, pulls the liquid some way up the sides of the rod, the surface of the liquid is increased, and the surface tension, therefore, tends to prevent its rise. If there were no adhesion the surface tension would not allow the surface of the liquid to remain level where it approaches the rod, but would round the corner so as to get the least possible surface. This tendency would be upset by gravity, so that a state of equilibrium would be reached in which the surface was by no means the least for the volume; but any further reduction would be prevented by the force of gravity, which would overcome the surface tension. If the rod, as imagined, has, to begin with, no adhesion for the liquid, the liquid has a curved surface, so that the rod stands in a sort of hole in the liquid, the hole having its top belled like a trumpet. If the rod has a little adhesion the liquid will stick to it up to a level somewhat below the surface, and the liquid will then leave the surface at an angle and begin to turn over from there. As the adhesion is increased the liquid touches the rod higher and higher and leaves the surface at a greater angle, until the surface is level and meets the rod at right angles. If the adhesion is still greater the liquid rises against the rod, the angle changing, until the liquid surface meets the surface of the rod at an acute angle in the new direction. The angle between the surface of the solid and the liquid called the contact angle thus depends on the adhesion, the surface tension and gravity. Whether it depends at all on the gas in which the whole is immersed we do not know. The surface tension has nothing to do with the solid, while the adhesion depends both on the solid and on the liquid.

Returning to the ores, the various sulphides have different adhesions. The gangue, as a rule, has very great adhesion, and cannot be floated. Even such bodies as stibnite, unless very finely ground, have too much adhesion to be floated at ordinary temperatures. The adhesion is altered enormously with change of temperature, however. This is well known in the case of taking out spots of grease from clothes. If the cloth is ironed with blotting paper underneath it, the grease will run from the hot cloth into the cooler blotting paper. In the same way, cloth that seems dry when cooled seems damper when warmed, as the adhesion or capillary attraction is reduced. A thick piece of dry bread when toasted gets quite moist in the center, partly because the water has moved in from the outside, which is hotter than the inside, and partly because the adhesion is less. In the case of ores, many of the sulphides, such as galena, stibnite and molybdenite, have their adhesion reduced enough to be floated easily near the temperature of boiling water, and though the surface tension is also reduced with increase of temperature, the adhesion is reduced much more quickly. The surface tension becomes zero at the critical temperature; the adhesion probably falls to a very low value at the boiling point.

In order to get concentration by flotation, it is necessary to have an ore whose valuable constituent is some 'greasy' sulphide,† such as galena, or at most so automatically attached to the greasy sulphide that it comes off with it. Zinc sulphide is thus easily raised by galena when intimately associated, as in the Broken Hill and some of the Vieille Montaigne Company's ores.

It is not enough to have the greasy particles; it is necessary to produce the gas bells and get them against the particles. In practical work the only gas that comes off is carbon dioxide, and this appears to come largely from calcite. But mixing calcite with an ore which has a greasy constituent will not necessarily float it; the gas is apt to come away from the particles of calcite without getting attached to the ore. It seems much more likely that the gas that really effects the flotation is generated by the action of acid on small quantities of carbonates produced by a slight weathering of the ores. It is most likely due to small amounts of carbonate of iron and manganese. These carbonates are also not attacked by dilute acid in the cold.

But there is another consideration. The question of adhesion, and of formation of adherent gas bells, is intimately connected with the air-film. Most, if not all, substances condense a volume of air or water, or both, on their surfaces. An extreme case of this is the absorption of hydrogen gas by palladium. No compound is formed here because, according to Roozeboom, the amount of gas absorbed at any particular temperature is *not* constant, but varies with the pressure. Other elements, for example, vanadium, nickel and copper, also absorb small quantities of hydrogen, but in no case does the amount of gas absorbed bear any simple atomic ratio to the amount of metal. Thus vanadium absorbs 1.3% of its volume of hydrogren, electrolytic zinc a few hundredths of 1%, copper wire 0.306 vol., ordinary porous nickel absorbs 165 vol. of hydrogen, but loses it again in two to three days, and so on. These solid solutions, occlusions, or condensations, whatever they may be, must be carefully distinguished from the true hydrides, such as those of the alkali metals. The condensation of gases on solid surfaces and the great persistence of the film is especially familiar to workers with high vacua. A glass bulb, for instance, on exhaustion keeps on giving off gas for days. If the bulb is heated as strongly as the glass will bear, the gas comes off much more quickly. This air-film seems to be intimately connected with the small adhesion for water. It may be that the air-film is itself the result of adhesion for gas, which is able to condense the gas on the surface. It cannot be any simple action of that sort, however, for time has great influence. Thus the gas comes off the inside of the exhausted globe very slowly, as already mentioned. On the other hand, small metal objects will float on water. Interesting experiments in this direction are recorded by Mayer. He floated rings of various metals—aluminum, iron, tin, brass, copper, lead and German silver—made of 1 mm. diameter wire and 50 mm. in diameter on water. The metals, however, must be clean and dry. If, after one of these rings has been sunk in water, it be dried and the experiment repeated, it will be found impossible to float the ring. After leaving it in the air for half an hour or so, it can be again floated. Similarly a heated platinum ring will not float immediately after cooling, but will do so after lying in the air for a short time. This shows that the film takes time to form. Another way of demonstrating the presence of the gaseous envelope is to sift some powdered substance which easily sinks, such as sand or ferrous sulphide, on the surface of hot water, previously freed from gas by boiling. Bubbles of gas rise from the surface of the solid particles.

Many observers have recorded the floating of perfectly dry sand on water. Evans also found that pieces of slate $1.5 \times 0.75 \times 0.1$ cm. float on tap-water, if perfectly dry. According to Simonds, the floating of the sand depends on the shape of the grains. Ladd notes the same condition, and adds that the pieces must be sharply angular. Feldspar and mica will also float under these conditions. Spring has made some experiments on the wetting of sand, and finds that it depends chiefly on the capillary-constant of the liquid and on the fineness of the particles.

However, the substances usually known as gangue are much more easily wetted than others. Thus, iron pyrite is easy to wet; that is to say, difficult to float, whereas antimony sulphide is difficult to wet, or easy to float.

A particle which is once wetted will never float, because even if a gas bubble were formed on or round it, it would not carry the solid up, as it falls through. On the other hand, if a particle has still a very thin film on it, but this is insufficient to buoy it up, it is easily conceivable that by generating gas, such as CO_2, upon it, this gas will add itself to this small air-film and eventually raise the particle. Here, again, the temperature seems to be of importance, and this probably explains why a substance like ferrous carbonate, which is not attacked by dilute acid at a low temperature, is better than calcite or copper carbonate, which are attacked in the cold.

Nothing is known about the thickness of the air-film, or whether it is the same for all substances, or, as is more likely, variable. But it is very probable that for a given substance the thickness of the film is the same whatever the size of the particle; hence, only small particles can be raised without the addition of some other gas, such as CO_2.

That the air does play an important part is shown in the case of stibnite and molybdenite. They can be concentrated by placing the ore in water nearly boiling. Apparently there is enough air on the surface of the particles to form with the steam a bell consisting of air and steam, which floats the particle. The air-film, or surface with small adhesion, also gives a bell of gas or of steam a chance of forming. The surface tension makes it impossible for a bell of steam to start, as the bell is under extra pressure due to the surface tension, the pressure of the contained gas varying inversely as the diameter of the bell. Thus a bell of air at ordinary temperatures of 0.01 mm. diameter has an extra pressure equal to a head of about 30 cm. of water. The explanation we offer—and it seems sufficient for the Potter process—is, therefore, that all solids have on their surface when dry a thin film of gas, probably air. Some of them, such as sand, quartz, carbonates, easily give up this film in water and become wet; while others, such as most metallic bodies, and especially the sulphides of lead, molybdenum and antimony, have a smaller tendency to part with the film and are not easily wetted. These can, therefore, be floated. If the air-film is insufficient to raise the particle, the flotation can be increased by the slow generation of gas on the particle. But if the particle has once lost its air-film, that is to say, got wet, it can never be raised, and no amount of gas generated on it can help matters.

To sum up, we would suggest that the selective flotation is due to the presence of 'greasy' sulphides, which have small adhesion, and that a high temperature is necessary to reduce the adhesion enough for the bells of gas to stick. It seems necessary that the gas should be produced at the surface of the particles themselves; and it is, in fact, produced by the decomposition of carbonates, due to slight weathering of the ore. If an ore that can be floated is treated with acetic acid to remove the traces of carbonate, it cannot then be floated again. The air-film also plays an important part; and if an ore is thoroughly washed or boiled in water to remove the air-film, it cannot be concentrated with acid. Some ores, such as stibnite and molybdenite, appear to have enough air on their surface to form a mixture of air and steam at a temperature below boiling point, which has enough volume to float the particles. Acid is therefore unnecessary in such cases. Of the various ores and sulphides we have tried in dilute acid or acid sulphates of soda, the following are most easily

†This effect of greasiness was well shown by the following experiment. Some ordinary steel filings, which probably had some oil on their surface, were immersed in dilute acid. Hydrogen was evolved round the particles, which were kept dry by the oil, large bubbles rose to the surface and burst, leaving absolutely dry filings on the top of the liquid. Clean new filings did not show this phenomenon.

floated, in order of merit: 1. Molybdenite. 2. Stibnite. 3. Galena. 4. Mixed zinc-lead sulphides, such as the Broken Hill ores. 5. Copper glance. 6. Zinc-blende. 7. Iron pyrite.

The last two scarcely float at all. Copper glance only floats if slightly weathered, and then only in very small amounts. With the Broken Hill ores the ratio of the Zn to Pb in the concentrate differs very little from that in the ore, only the gangue being left behind. Galena is fairly easy to float if finely ground, but owing to its rather high specific gravity very fine pulverization is necessary to float it successfully. Stibnite and molybdenite go quite easily, owing to their very greasy nature. It is interesting to note that ground malachite (copper carbonate) floats fairly well in water. It may be remembered that this mineral has a peculiar greasy feeling. Beyond this, we have not found any other carbonates that float.

This list is only roughly correct, however, and it is most probable—in fact, almost certain—that various samples of sulphides differ considerably; and if a slight weathering is necessary to produce the small trace of carbonate needed to give flotation, the 'greasiness' in itself is not sufficient to give the separation. It is, in fact, quite impossible to tell beforehand which ores can be separated by flotation.

We have not gone much into the question of merits of the various solutions used for concentration by flotation. Potter originally used dilute acid, preferably sulphuric, of about 2% strength. A saturated salt-cake solution is employed by another inventor, Delprat.*

MOLYBDENUM.—In many respects molybdenum resembles tungsten, belonging to the same group of elements. It is used for similar purposes as tungsten, though not nearly so extensively, one of the reasons being that it is more difficult to prepare in the pure state, and that its ores do not occur plentifully. The effect it has upon steel is by no means finally settled, and though it is said to be from two to three times as powerful in its action as tungsten, it is not to be relied upon to the same extent, as it is more difficult to alloy with steel, because of its liability to oxidize and volatilize. The chief ores of molybdenum are molybdenite, MoS_2, and wulfenite, $Pb\,MoO_4$, both of which are comparatively rare minerals. In the pure state it contains 60% of the metal and 40% sulphur, and if testing 90 to 95% MoS_2 is worth from 1s. to 1s. 3d. per lb. in London. Parcels are often sold cheaper, as there really is no fixed price for the mineral, sales generally being a matter of negotiation, as is the case with so many of the rarer minerals. According to some manufacturers, wulfenite is the best raw material for the preparation of suitable metal. It is first melted with soda ash and carbon, resulting in the formation of metallic lead and a fused mass of molybdate of soda, from which molybdic acid is separated. The latter is then reduced with carbon in crucibles very much like tungsten, yielding a gray, metallic powder of about 95% purity, with 2 to 3% carbon and a considerable quantity of undecomposed oxides, by no means an ideal product. The present price of metallic molybdenum, either as metal or in the form of a ferro-alloy, is about 5s. to 6s. per pound in London.—O. J. Steinhart, *Trans. Inst. M. & M.*

ALUMINUM AS AN ELECTRICAL CONDUCTOR.—This is one of the most promising fields for aluminum. As compared with copper, the cost of transportation and erection of aluminum conductors is less, the durability greater, and the cost of maintenance lower. Contrary factors on the part of aluminum conductors are difficulty in making joints, sag due to large co-efficient of expansion, and insufficient strength of the wires in sizes ordinarily employed for telegraph and telephone lines. A small percentage of copper added to aluminum would increase the strength of the wires, but somewhat impairs their conductivity. However, there have been some large installations of aluminum conductors for transmitting light and power to important manufacturing and railway plants.

USES OF FULLER'S EARTH.—Abroad the principal use of fuller's earth is for fulling wool, but in America the greater demand is for deodorizing, bleaching and clarifying fats, oils and greases. In this country the largest consumers are the manufacturers of lard and cottolene. For the purpose of clarifying lard and cotton-seed oil a small quantity, 2 to 3%, of fuller's earth is ground to a fineness of 100 to 120 mesh and is added to the hot oil. After a thorough agitation the hot liquid is passed through a filter press, and when the earth and coloring impurities have been removed the oil is nearly white.

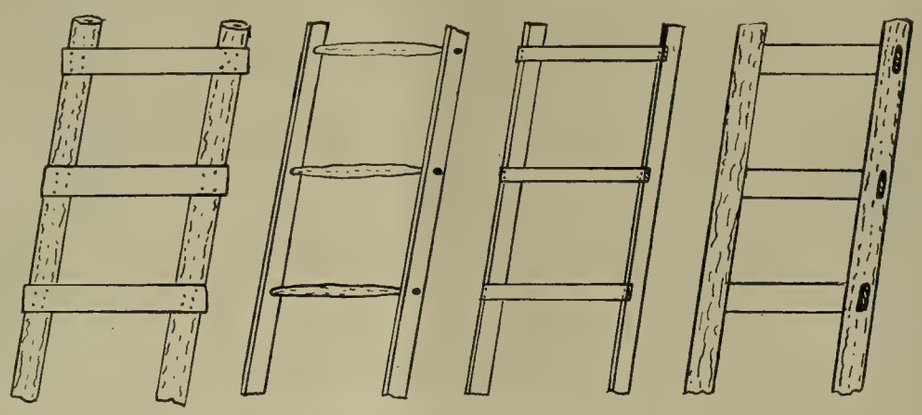
* A paper read before the Faraday Society, December 12, 1905.

Making Mine Ladders.

Written for the MINING AND SCIENTIFIC PRESS by MATT. W. ALDERSON.

The first requisite of a mine ladder is strength. In this respect it differs from the ladder of a carpenter; for such a ladder must be light, that it may be easily moved from one place to another. A mine ladder should be strong that it may be ready for any emergency, such as the necessity of several men standing upon a short section in the placing of machinery; carrying an injured workman to the surface; withstanding rough usage, the effects of blasts, the fall of tools, and even small rocks.

Where a manway is on an incline it may be run as a continuous ladder from one level or station to another. It requires much less strength to climb a ladder on an incline than when it goes straight up, and, if a man needs to rest on such a trip, there is no tax on his arms, the weight of his body resting naturally on his feet. In such a position he may do many things, should occasion arise, with little danger of falling, whereas nearly all of his strength would be required on an upright ladder to enable him to retain his place. Three men were going down a vertical ladder in a Montana mine. The top man in some way lost his hold and fell, knocking the two men below him into the sump. Wherever it can be, a ladder should be so constructed as to preclude the possibility of such an accident. In compartment shafts, where the ladder is of necessity vertical, lifting doors are frequently placed not further apart than 50 ft., being a protection in some measure and affording checks on air-currents, as well as partial protection from smoke in case of fire.



Types of Mine Ladder.

The best uprights for a ladder are pine poles four to five inches in diameter at the large end. Two by four inches are fairly good, but should not be used when one can get heavier and stronger material. If sawed timbers are used, three by four inches are good size. Occasionally, one sees a ladder in a mine with slats two inches wide made from one-inch lumber which has been surfaced on one side and which, when seasoned, is just about three-quarters of an inch thick. These are not of sufficient strength. They will wear down quickly where many men step on them every day with hob-nail shoes. Moreover, such slats break easily, and it is necessary to renew them too frequently.

It is true that in large mines the ladders are used very little, but it is imperative that they be strong and kept in good condition, for the demand is severe on them, if anything goes wrong and the men make a rush to get out of the mine. A slat should not be less than three inches wide and 1¼ to 1½ in. thick.

In making a ladder, lay the two poles side by side, crowning side up. Commence at the large ends, which should form the bottom of the ladder and should be cut off square. Now take a measure and mark each foot along the poles with a saw-cut about one-eighth of an inch deep. Nail on the bottom slat and the slat one foot below the top, and then the intervening slats, all being of the same length, 16 or 18 in. Where possible, the ladder should be built from the bottom. The first length is put in, the top slat not being nailed on. The next length is let down to rest squarely on the top of the length below. Side strips are then nailed on, thus splicing the two lengths and making them one. The slat left off the bottom length is now nailed on.

Many persons 'gain in' the ends of the slats. This is waste of effort and a great inconvenience when it is necessary to renew a slat. A mine is nearly always damp, the nails rust, the gained-in portion swells, and one will need several tools to get a broken slat out and the bearings clear for a new slat. Where the slat is nailed on flush, a cracked or broken one is sawn through about half way between the uprights, and a few blows of a hammer loosen it, the slat acting as a powerful leverage in drawing the nails. A new slat is put in place of the old one and just where it belongs, the slight saw-cut being a mark easily found in the dim light of the mine, even if the ladder is covered with dirt.

In putting ladders in raises, I have found it a great convenience to lay the ladder out on the surface and put it together in the mine. It is much easier to carry a long pole around corners and up into a raise than a made ladder, and when the places for the slats are marked as I have indicated, the ladder is put together almost as rapidly in the mine as it would be on the surface. Stand the uprights on the mine level. Nail on the bottom slats and climb up the ladder nailing on the slats as you go. Hoist subsequent lengths to place above the first. If the ladder is too long, fasten it temporarily to the bottom part with wire or rope. As soon as space will permit, lift it to place, splice it to the part below and secure it to stulls or other timbers as if you expected it to remain there to the end of time.

The poorest ladder for a mine is of the style used by carpenters, with wooden rounds an inch or more in diameter. When the rounds are of iron gas-pipe an inch or more in size the ladder is all right for most mines. Where the rungs are of bar iron, as in the mines of Australia, the ladder is excellent as a permanent ladder where there is no chance for falling rock striking a rung and bending it so as to destroy the spacing of the steps. In some of the mines of Butte, however, ladders with iron rungs would soon be nothing but death traps. In such mines it may be advisable to have slats gained or dovetailed in. A preferable ladder, however, is one made wholly of wood, of a type similar to a carpenter's ladder, only with rungs 1¼ by 3 in., mortised in. Such a ladder fastened with wood or non-corrosive metal would be something to depend upon always.

A light ladder should be made for sinking, to connect with the permanent ladder. This may be made of two by four inches, or poles two inches in diameter. The steps should be 12 in., as in the regular ladder; 14 in. is the regulation distance between rounds on a carpenter's ladder. A hod-carrier uses a ladder with 10-in. step. This is all right for a mine where it is used continuously by men who carry loads up and down, otherwise the 12-in. step is preferable; and, as habit exercises a powerful influence on men and it is annoying, and might be a source of danger, to climb a ladder the steps of which are longer or shorter than one is accustomed to, all ladders in a mine should be uniform.

The slats should be firmly nailed with 16-penny nails. The ladders should be securely fastened to timbers firmly set, with solid bearings at every available place. Most persons make the mistake of thinking the ladder will be used but a few years. It should be put in to be solidly in place, if some one needs to use it 50 years hence. No one ever makes a mistake in doing his work just as thoroughly as it is possible.

ALUMINUM PAPER is being manufactured and placed on the market, its special application being as a substitute for tinfoil. It is not the so-called leaf aluminum, but real paper coated with powdered aluminum, and is said to possess very favorable qualities for preserving articles of food, for which it is used as a covering. Chemical analysis have proved that aluminum paper contains but few foreign substances; occasionally it may contain up to two per cent of iron, but never any arsenic or other poisonous metals. Hence, it appears that the powdered aluminum used for the manufacture of this paper is relatively pure. The paper used is a sort of artificial parchment, obtained through the action of sulphuric acid upon ordinary paper. The sheets are spread out and covered upon one side with a thin coating of a solution of resin in alcohol or ether. Evaporation is precipitated through a current of air, and the paper is then warmed until the resin has again become soft. Powdered aluminum is then sprinkled upon it and the paper is subjected to strong pressure to fasten the powder upon it. The metallic covering obtained is neither affected by the air nor by fatty substances. Since aluminum paper is much cheaper than tinfoil, it is believed that it will become, when generally known, a strong competitor of the latter.

SIMPLON TUNNEL.—On January 25 the ordinary passenger service through the Simplon tunnel began, the first train entering the tunnel at 8:56 A. M. from the north and leaving at 9:33 A. M., says the London *Electrical Engineer*. The best of conditions prevailed so far as temperature and other matters were concerned. The train consisted of an engine and four passenger coaches, containing a number of eminent personages. The boring of the tunnel has occupied nearly seven and one-half years, and the estimated cost originally fixed at $11,750,000 has been far exceeded.

Air-Hammer Rock-Drills.

Contributed to the MINING AND SCIENTIFIC PRESS by EDWARD A. RIX.

It is evident from the way in which air-hammer rock-drills are invading the mining field, that they must be given a serious hearing. Because they weigh less than 20 lb., and may be held in the hand during operation, is no reason why they are not entitled to respect. When I first heard of them, I, in common with many others, thought that they were merely an off-shoot from the frenzied claims of pneumatic-tool builders, who were trying to find an outlet for their over-productions.

A letter two years ago from some young men at the Black Oak mine, who were selling the Little Wonder drill in that territory, led me to invite them to call on me at San Francisco and show me what they could do. This they did, and I learned a great deal about rock drilling in a very few minutes. I realized that piston rock-drills had a rival in the field.

Manufacturers have always known that a light-weight drill was wanted in mining, and machines have been built with cylinders of only 1½ in. diameter. But they weighed 75 or 80 lb., because they were arranged for column mounting and all had rotating motions. It seemed to be accepted as gospel that in order to drill to any depth, the hole had to be round, and in order for it to be round, the steel had to be rotated; and that this rotating mechanism really determined the character of the machine, increased its weight and forced it to be mounted. When I saw an 18-in. hole neatly drilled in very hard granite and as round as possible, by a simple turn of the wrist with a 17-lb. machine held in the hand, and with good speed, I saw that the pneumatic hammer had a future.

There are four of these machines upon the market today adapted for mining work; named in the order of their introduction in mining, we have: the Wonder drills of the Hardsocg Wonder Drill Co., Ottumwa, Iowa; the Shaw Eclipse Air-Hammer drills of the Shaw Pneumatic Tool Co., Denver; the Little Jap drill of the Ingersoll-Rand Co., New York, and the Murphy drill of C. T. Carnahan Mfg. Co., Denver.

It is always interesting after a machine has proved a success, to know how it first came to be produced, and I have been at some pains to try and get this information, so that it might be of record, but I find that the commercial atmosphere which environs the whole subject is so cloudy that it is hazardous to make a positive statement. It is a well-known fact that short holes have been drilled in stone, with pneumatic tools, ever since a chisel was first put in them. This has led many to claim that they were the originators of this style of rock-drilling, but we need not treat such claims seriously. From all I can learn, the real originators are Martin Hardsocg, of Ottumwa, and C. H. Shaw, of Denver, and because of the rival business relations with each other it is difficult to determine which of these persons was the originator. It may be possible they arrived at their results simultaneously.

I have asked Mr. Hardsocg to give me his statement in the matter, and he writes me as follows:

"I believe that I am the first man that ever made the air-hammer drill a success, and that I am the originator of the idea of using it for drilling holes over 6 in. deep. I found out that pneumatic hammers were being used for drilling plug and feather holes in rock. The turning of the bit was done with a wrench and the dust was blown out by a small hose attached to drill, and direct air through the hose served to blow out the cuttings while the tool was in operation. The idea occurred to me that if a hole were made through the bit so the air could pass through, the same would serve the purpose much more satisfactorily, as the hose could not blow out the dust over 6 in. deep from the top of the hole and it therefore would not answer for drilling holes from one foot to five feet deep. At that time I was not aware that Leyner was making a large drilling machine with hollow bits and using water for the purpose of getting the cuttings out of the hole being drilled. I also claim to be the originator of making a bit with more than four corners. This was designed for the purpose of making it less difficult to drill a round hole with so rapid a striking tool as the pneumatic hammer, and to avoid turning the drill by a wrench, I simply turned the bit with the hammer, which made it far more convenient. In place of making a turning device for turning the bit, as is commonly used on most all power drills, I simply turn the hammer, bit and all together, doing the turning at the same time that the drill is fed into the rock. The air-feed was invented by our foreman, C. J. Smith. At the beginning, I bought the hammers from different pneumatic hammer manufacturers, and the last I had made was by Mr. Shaw of Denver, by inducing him to alter his hammer for my special purpose. I soon after manufactured them myself, and I also made further improvements in the construction of the hammer, forging the whole hammer, handle and all, out of one piece and putting on a rubber flexible handle to avoid vibration to a man's arm."

Mr. Shaw claims that prior to the time spoken of by Mr. Hardsocg, he had a hammer drill in operation at the Elkton mine at Cripple Creek. These statements must constitute, as far as I am concerned, the history of the beginning of these machines.

In construction, all of the drills have about the same weight and exterior appearance, and they are all alike mechanically, except the Little Jap, which has a valve actuating mechanism, while the others are valveless hammers, or vibrators, having a piston which is its own valve and which is the only moving piece in the whole mechanism. These valveless machines are economical in the use of air, because the live air at full pressure acting upon a small area of the piston or hammer which causes the backward stroke, is, after the backward stroke, again used expansively at a lower pressure upon the whole area of the piston, to give the forward stroke. The piston has a diameter of 1⅝ in. and an approximate width of 1⅞ in., and makes about 2,000 blows per minute. The end of the piston is hardened and impinges directly upon the end of the drill-steel which is held loosely in the chuck and by reason of its being hexagonal, the steel may be rotated slightly back and forth as the hammer is twisted by the hand.

All of these hand-drills weigh about 17 lb., and consume, let us say for safety, 25 cu. ft. free air per min., although claims are made for 17 cu. ft. They should be operated at about 80 to 90 lb. pressure per square inch.

It was early learned in the piston rock-drill business that while a short stroke did good work in drilling, it was useless because it would not throw the drill dust and cuttings, or the mud out of the hole, and the bit would soon become clogged and useless. Leyner overcame this by using a hollow steel and forcing water through the steel to the drill-point, thus not only keeping the cutting point clean and giving it great advantage for rapid drilling, but the water kept the drill-point cool and preserved its temper, thus making it do more work. The hammer-drill manufacturers used air in the same manner that Leyner used the water, and used the same hollow steel but they raised a large amount of dust, which at first threatened to drive the machines out of the mines, but objections to this are growing fainter and fainter and like the objections to the headache-producing fumes of giant powder, will soon be heard of no more.

This does not mean that the manufacturers are not trying to remedy this evil, for they are trying their best. The Murphy people provides a sponge which may be readily fastened around the drill-steel, and being saturated with water is used like the old-time mop in hand-drilling, and indeed a regular old-time mop can also be used effectively; water thrown from a can or small hose will also kill the dust.

The Little Wonder Company provide a simple attachment for the end of the drill so that water may be discharged through the hollow drill, and if a water supply from pipes or hose is not available a small container, holding 10 gal., is supplied and connected to the air-pipe, so that the water is forced from the container through the drill-bit.

All of these various devices, however, mean attention, thought and care on the part of the miner, and the general result is that he leaves them all out and endures dust; and right here, it might not be amiss to suggest that the simplest solution of this dust problem would be a practical, inexpensive head or face gearing of some kind, to be worn by the miner; whoever will perfect such a device will find a ready market for it, because these hammer-drills have come to stay and conditions will have to be met.

At first, the drill-steel was simply a tip about six inches long welded to stay-bolt iron, which has a small hole throughout its length. This was done because drilling the steel was expensive; in consequence, the drill was round, about ⅞ in. diam. There proved to be objections to the round shape, the welds were always breaking, so that at present the all-steel hexagonal shape is preferred, and means have been found to render them not too expensive. Some find that solid hexagonal bits will do their work well enough, and that by using water freely and spooning or gunning the hole frequently, satisfactory work is done, but this is for the most part in the softer rocks or in sinking, where there is sufficient surface water to keep the hole flooded, or in the uppers where the dust will gravitate away. Nine-tenths of the machines, however, exhaust the air through the steel to clean the hole. The first bits were made with parallel ridges like a stone mason's dressing hammer and files were used to sharpen them. Then these ridges were made radial and shallow, and still sharpened with a file, but these methods were soon abandoned for a radial-toothed bit that can readily be sharpened with the proper dolleys. Six teeth seem to be the favorite number. It is evident that the less the teeth, the greater the angle of rotation for the machine—in order to make a round hole, but inasmuch as it is easier to operate the drill the smaller the angle of rotation, there quickly developed bits with many teeth. But here again, it was found that the greater the number of teeth, the smaller they had to be, and the harder they were to sharpen, and thus gradually was developed the six-tooth bit as a compromise. One manufacturer has developed a machine for sharpening these drills which is convenient and will save time and expense where a number are at work.

The hose used is one-half inch pneumatic hose with plain couplings or lightning couplings, as may be desired.

At first these machines were used with a valve or trigger that had to be held open by the hand or by pressure, but it tires the operator, and it is generally conceded now that a plain shut-off valve similar to those used on standard mining drills is preferable.

The first objectionable impression created upon seeing these hammer drills in operation, is that the vibration and jarring would soon put either the operator or the drill out of commission, but such is not the case. There is no more vibration than there is at the feed-screw handle of a standard mining drill, or than is encountered in the many thousands of pneumatic hammers used in industrial work. Of the two, I imagine the mining hammer is preferable to a caulking or riveting hammer, for it does not irritate the ear as much.

To overcome, however, this objection, and to provide a convenient means of holding the drill for uppers or for holes beyond the ordinary reach, the pneumatic feed has been invented; this, I understand, is the occasion for the first infringement battle to be soon fought between the patentees. The pneumatic feed is simplicity itself and consists in fastening the hammer to a small piston-rod which has a motion of from one to three feet in a small pipe cylinder. The compressed air behind the piston-rod keeps the drill against the rock steadily, and automatically follows the progress of the drilling. It also absorbs all the vibration. In most instances, it requires a mounting and this is done with a small column, arm, and clamp, the same as a piston-drill. These appurtenances, however, are so light and small compared to those used for piston-drills that they may be set up in one-third the time.

What I have heretofore said, applies in general to the light hand-machine which I consider to be the one most generally applicable to mining. The success, however, of the hand-drill, has led the manufacturers a step further, and they have produced a slightly heavier machine which is mounted on a column, arm, and clamp and which is calculated to dispute the ground with the standard baby drills of the regular type, but inasmuch as it has by no means yet been proved that they offer advantages over the standard baby drills, I shall let this part of the subject alone.

The advantages of the hammer-drills appear to be:

1. They are extremely simple, having, in general, only one moving piece.

2. They require little, or no repair if properly oiled, thus saving much time and expense.

3. Requiring but a moment to change bits, clean a hole, or to begin a new hole, at least nine-tenths of the labor paid for, is for drilling, while in the piston-drills, the actual drilling does not occupy more than two-thirds of the time and probably not over one-half.

4. The destruction of drill-steel and breaking and dulling of bits for the same footage of holes is not over one-half that caused by the standard drills.

5. It is economical in power, each machine requiring one-half the air consumed by the smallest standard piston-drill.

6. It can be used in extremely close quarters, where it is impossible to use a piston-drill or even to swing a hammer.

7. It does not require any special skill to operate it. In a half day's time an unskilled laborer will find himself perfectly at home with the machine and will be doing satisfactory work. And herein lies one of the great values of this machine. It takes a real miner to use a hand-drill, or run a piston-drill, particularly the latter, for only experience can overcome the difficulties of seamy ground, fitchered holes, or teach a man how to start a hole, set up a column, and determine the speed, pressure and stroke for a piston-drill. It is now possible for a layman to do a little prospecting with unskilled labor, as far as removing rock is concerned, and the menace of combinations of skilled labor cannot be as effective as it might otherwise be.

8. In rock suitable for the operation of these hammer drills, the investment for drills and machinery and the power required is about one-half that necessary for the standard drills. Thus it gives prospectors of limited means an opportunity to instal a power-drilling plant, which will save them time and energy in determining the value of a mine.

In averaging the claims made by the manufacturers of these four air-hammer drills, I find that they claim in average granite or quartz an inch and a quarter hole can be drilled at the rate of three to four inches per minute, and in hard sandstone or limestone, or similar rock, from seven to ten inches per minute. These statements are misleading, for the speed of drilling diminishes with the depth drilled, for a good mechanical reason, independent of any difficulties that a deep hole may of itself offer. The longer the drill bit, the heavier it is, and consequently the more power it takes to overcome its inertia, the less effect the blow will have. There is, then, a limit to the depth which these machines will drill economically. Just what it is, I do not know, but it is about four feet. The standard rock-drills are not subject to this limitation.*

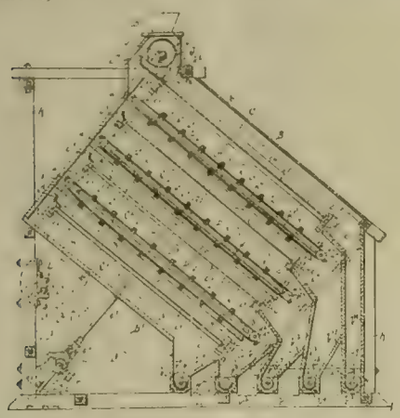
*Abstract from paper read before California Miners' Convention.

Mining and Metallurgical Patents.

PATENTS ISSUED FEBRUARY 6, 1906.

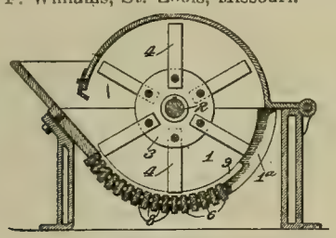
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

SEPARATOR.—No 811,192; F. R. Willson, Jr., Columbus, Ohio.



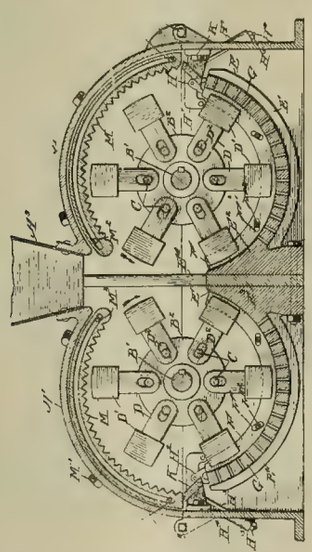
In a mechanism for screening ores or other material, the combination of the series of inclined superposed screens, the pair of longitudinally reciprocating actuating devices arranged one at either side of series of screens and pivotally connected to each screen of series near its center, the ends of each screen being free to vibrate about the axis of its pivotal connection with reciprocating device independent of the vibration of the ends of any other screen of the series, reciprocating actuating device being arranged to bodily reciprocate series of screens in planes at an angle to the planes of the flow of material along the screens and the series of vibrating sustaining devices each flexibly connected to one of screens and also connected to a relatively stationary support.

CAGE FOR CRUSHERS AND PULVERIZERS.—No. 811,679; M. F. Williams, St. Louis, Missouri.



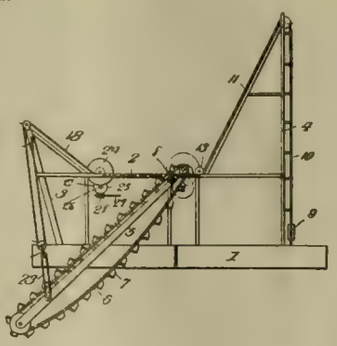
The combination with a support having curved groove, of cage-bars having reduced ends projecting into groove whereby shoulders are provided on the cage-bars adjacent grooves, an inner-ring mount co-operating with shoulders, and means independent of ring-mount for holding cage-bars spaced apart.

CRUSHER.—No. 811,671; P. L. Simpson, Chicago, Illinois.



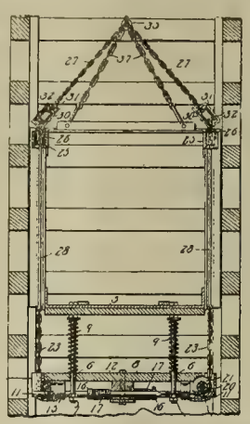
In crusher, combination with hammers, and means for rotating them about adjacent centers so as to crush material between them, of means for inserting material between hammers so that it will be crushed, dividing-block located beneath points of nearest approach of hammers to each other, and grate-bars extending in curves from block and underneath axes of hammers.

DREDGE.—No. 811,683; Frank Yeoman, Oroville, California.



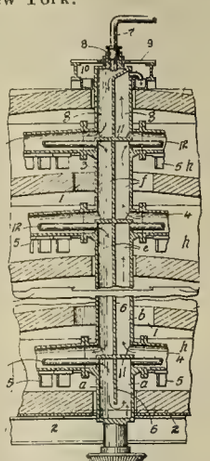
In a dredge, combination of float, vertically swinging frame mounted therein, and endless excavator mounted upon frame, series of side-line drums, driving-shaft for drums, power-shaft, longitudinal shafts geared to driving and power shafts, counter-shaft, frictional gearing between ends of counter-shaft and longitudinal shaft, means for driving counter shaft, main power-shaft, counter-shaft geared to latter and variable-speed driving connections between latter-mentioned counter-shaft and first-mentioned counter-shaft.

SAFETY DEVICE FOR MINE-CAGES.—No. 811,893; I. M. Adams, Shenandoah, Pennsylvania.



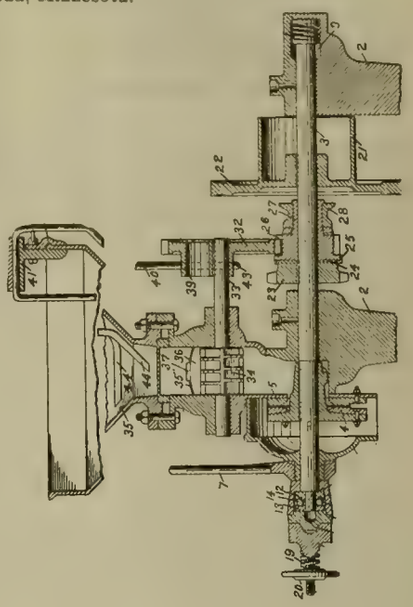
In a safety device for mine-cages, supporting-bar arranged below floor of cage, springs tending to depress bar, spring-projected locking-bolts carried by bar and arranged when projected to engage horizontal sills of shaft-timbering, and bolt-retracting connections between bolts and hoisting-cable, members being placed under sufficient stress to retact bolts and slightly elevate carrying-bar, cushioning-springs of latter serving as compensating means for bolts.

ROASTING FURNACE.—No. 811,643; F. Klepetko, New York, New York.



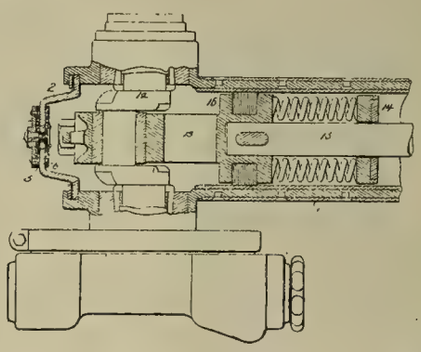
In furnace having plurality of hearths, hollow rabble-shaft passing through hearths and having passage way divided into contiguous intercommunicating conduits, series of hollow arms radiating from conduits and extending into several hearths, series of chambers separated by transverse partitions distributed throughout each conduit, distributing pipes leading from respective chambers and opening into adjacent arms, and feed pipe adapted to discharge cooling medium into one of conduits at point removed from point of intercommunication between conduits.

GRINDING-MILL.—No. 811,945; C. N. McLaughlin, Winona, Minnesota.



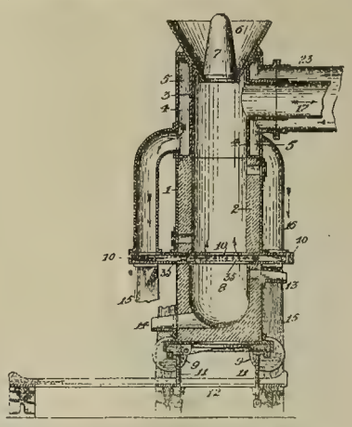
In grinding-mill combination, with fixed bur, of longitudinally movable shaft, bur provided thereon and normally in co-operation with fixed bur, spring normally tending to move shaft lengthwise and separate burs, ball bearing provided at one end of shaft to receive endwise thrust thereof, housing or cage for bearing, yoke having central bearing on cage, springs connected with ends of yoke on each side of bearing and arranged to overcome tension of first-named spring to hold burs in grinding engagement with one another, and mechanism for relieving pressure of yoke-springs on shaft to allow first-named spring to move it lengthwise and separate burs.

ROCK-DRILL.—No. 811,685; T. E. Adams, Cleveland, Ohio.



In a drill, combination of movable parts causing air-current to pass through drill-barrel causing feed of lubricant therethrough to lubricate part regardless of inclination of barrel, and valve mechanism in rear end of drill and means for adjusting valve mechanism to regulate direction of flow of air-current according to position of drill-barrel.

SMELTING-FURNACE.—No. 812,083; A. R. Partridge, San Francisco, California.



In combination with smelter, having double wall near its upper end forming hot-air space, outlet-pipe communicating with interior of stack, inlet-pipe concentric therewith and communicating with hot-air space, an exhaust-fan in connection with outlet-pipe, and fan-blower in connection with inlet-pipe.

Mining Summary.

Specially Compiled and Reported for the MINING AND SCIENTIFIC PRESS.

Special Correspondence.

LONDON, February 7.

The total output of the mines in British Columbia for 1905—reported at about £4,000,000—is some £400,000 in excess of the previous year. There was less gold produced, but a larger proportion of the baser metals.

From another British colony—Western Australia—the production for the past year is double in value that of British Columbia, in the precious metal alone, the total in fine gold being 1,955,316 oz. Compared with 1904, a decrease is noticeable of nearly 28,000 oz. A writer, regarded as an authority, who not seldom poses as the candid friend, puts his views on the present outlook of West Australian gold mining very tersely. He says: "So far as I can see there is only one mine that has not reached its zenith." An apologist, in reply, points out that in most cases the grade of ore now being treated approximates the general average grade of the mines, and is not picked, as was done formerly, to get big results. The feeling of the market is expressed in the fact that, taking a list of over 50 mines in Western Australia, there was only one rise of note during the three months to December 31 last; that was the improvement of £1 1/16 in Kalgurli Gold, to 9 1/16.

In spite of the steady decline in the average grade of ore crushed on the Rand, the dividends paid in 1905 amounted to £5,033,000, as against £3,880,000 in 1904. The increase is, of course, due largely to the introduction of Chinese labor and to other means of lowering working costs, so that a larger proportion of low-grade ore was milled at a profit. While no voice is raised as to the efficiency of the managements on the Rand, the methods adopted by the controlling financial firms are the subject of conflicting comment. No less an authority than Mr. H. C. Hoover is reported to have said on a recent occasion that "the whole South African scheme of organization is a shift to avoid responsibility to, or interference from, outside shareholders." As a counterblast to this pungent criticism the *Mining World* of last week may be quoted. The editor's remarks are to the effect that many crimes have been laid at the door of the Rand industry, but there is one that even shamefacedness has never had the audacity to allege—that of withholding information from shareholders. The views thus strongly expressed come a little curiously from a paper which publishes week after week voluminous reports of developments received from Western Australian and Indian gold mines and which rarely notices such reports from the Rand, for the very cogent reason that in the case of the leading South African mines they are conspicuous by their non-existence. The monthly statements of crushings do not convey all the information which shareholders in this country look for. They wish to know whether ore reserves are being blocked out to keep pace with, or ahead of, the monthly millings, and in this essential point they are left in the dark until the annual reports are issued. It is a long time to wait; meantime shareholders are at the mercy of vague rumors, often started by unscrupulous punters on the market. On the Chinese labor controversy it is clear that opinion even in South Africa is far from unanimous. As a fresh contribution we have the De Beers protesting that "so long as the De Beers Company exists the labor employed will be those mostly of British descent so far as white men are concerned, and the natives of the country"—a sentiment which was received with "loud applause" by an audience composed of De Beers staff and work-people. On this subject it is interesting to note that the salaries and wages paid to the whole mining industry of the Transvaal amounted in 1905 to £8,996,121, of which £5,660,493 went to the whites.

Large specimen lumps of fine-grained lead-silver ore from the Transvaal are on view in London, running, it is said, to 80 oz. silver per ton. They certainly present the appearance of having been taken from a powerful vein. The mine, which is undergoing preliminary development, is about 15 miles from Pretoria, in the direction of Johannesburg.

An important development is announced on the property of the Nerchinsk Gold Co., Ltd., probably the only English company operating in that part of eastern Siberia. The company, formed in 1901, is a reconstruction of the Siberian Goldfields Development Co., Ltd. The £1 shares were issued with 18s. credited as paid up. It is a company possessing mineral rights over a huge area—6,000 square miles—with very little available cash (at date of the last annual report) to prove its potentialities. Crushings have been delayed owing to difficulties in transit of the machinery, the railway having been congested during the Russo-Japanese war. The development in question has exposed a mass of ore 150 ft. in width, going an average of 12 dwt. gold per ton. The value of the ore so far opened up is estimated at £570,000, which would leave a net profit, allowing for 14s. as the cost of mining and milling, of £350,000, or about one-third of the nominal capital of the company.

A perusal of the various financial year-books at this season, if it does not lead to good resolutions for the future, serves at any rate to remind us of lost opportunities in the past. Our sense of failure brings home the fact that we have neglected to profit by the maxims laid down for the guidance of our tender years. A practical application of those high moral precepts would have brought us many of the joys of life we have missed. Had we not dangerously delayed to profit by the tips of confiding friends and lacked punctuality in "quietly picking up low-priced mining shares sure to go better by next account," we should have purchased Bostons at 17s. 6d. two years ago and sold them lately at £7; Anacondas at a little over £3 in 1904 and sold at £14 15s.; Camp Birds 15s. in 1902 and sold the following year at £2. With sufficient pluck we should have bought Esperanzas in 1904 at 18s. 9d. and sold them a short time back at over £6. Two years ago we should have bought Rio Tintos at £38 3/4 and sold them later at £68. There is another side to the shield—but we must not spoil good sport.

SALT LAKE CITY, Utah, February 19.

The annual report of the Daly-West Mining Co. shows the production of the Park City property of this corporation in 1905 to have been $1,234,458.71; which was obtained from the sale of 1,225,731 lb. of copper; 16,772,978 lb. of lead; 1,396.85 oz. gold; 1,798,628 oz. silver and 9,026,517 lb. zinc. There were produced 16,537 dry tons of crude ore that averaged $32.74 per ton, and containing 52.66 oz. silver, 0.041 oz. gold, 19.4% lead, 1.90% copper and 9.40% zinc; 15,994 dry tons of concentrate, which averaged $39.58 per ton, containing 52.65 oz. silver, 0.040 oz. gold, 28.71% lead, 1.67% copper and 16.50% zinc; 2,017 dry tons of crude ore from the 1,400-ft. level which averaged $24.35 per ton, containing 33.87 oz. silver, 0.033 oz. gold, 25.71% lead, 1.31% copper and 12.50% zinc; 419 tons of mill crude, which averaged $28.11 per ton, containing 40.78 oz. silver, 0.033 oz. gold, 24.41% lead, 1.32% copper and 15.20% zinc.

The financial statement shows a balance on hand Dec. 31, of $411,886.15, against $284,148.71 at the beginning of the year. In addition to the receipts from ore, there was $2,800 from miscellaneous sources, making a grand total of $1,237,139.60. The disbursements, including $432,000 in dividends, aggregated $1,109,401.90.

General manager Ernest Bamberger reports that the condition of the mine is not as good as a year ago owing to the stoppage of the Ontario drain tunnel, by caves last March, which resulted in the lower levels of the mine becoming filled with water, thus preventing exploration there. It had been planned to open the mine through the extension of the drain tunnel, to the depth of 2,100 feet. The development of the upper levels is reported to have brought only fair results.——At the Cactus mine, in Beaver county, some experiments are being carried on with the Waterbury process for leaching of copper ores. Manager Lee Hanchett says that the surface is being stripped by steam shovel preparatory to mining ore, and adds that there is a covering of from 5 to 15 ft. of earth to be removed. It is expected the mill will be receiving ore from this source within thirty days.

Although nothing official has been given out to confirm it, there are growing indications that things are working toward bringing the Bingham Consolidated mines and smelter into the American Consolidated Copper Co. The fact that F. Augustus Heinze has been a heavy purchaser of the stock lately and the presence of his experts at the Dalton & Lark, in Bingham, has convinced the Salt Lake public that Heinze has tied up with Coram in some manner and that he will likely be a factor in Utah copper camps in the future. The coming of the Heinze experts has been food for much comment during the past week. It seems equally certain that examinations which have been going on in the Tintic district were directed from the same source. It has developed within the past few hours that control of the Mammoth mine has been tied up, and, while the management of the latter will not let out a word in the nature of a confirmation, there are reasons to believe that plans are well matured to gather in the Mammoth, as well as the Grand Central and Victoria. With these three mines, in addition to the Eagle and Blue Bell, adjoining, the American Consolidated would have an estate in the camp that could be depended on for many years for a supply of silicious silver-lead ores.

The Heinze experts are still at the Dalton & Lark and will probably remain there for at least a week more, when they will move on to the Commercial mine, in Upper Bingham canyon.

Manager Walter C. Orem, of the Utah Apex mine, at Bingham, will probably let a contract during the present week for the construction of the 2,000-ft. aerial tramway, which is to connect the upper workings of the mine with a station on the Copper Belt Railway. With this line finished the plan is to increase the output of the mine. Utah Apex ore is desired by the smelting concerns and there are few, if any, companies operating in the camp that can get as low treatment charge.

At the Boston Consolidated Co.'s mines, the management has several diamond drills at work prospecting the copper-bearing zone. At the same time tunnels are being extended and crosscuts run, opening up the ore bodies. Experiments at the temporary mill are progressing, but Metallurgist Bettles has announced that until his work is finished and his reports are in the hands of Managing Director Newhouse there will be nothing given to the public. It is said, however, that Mr. Bettles is still of the idea that better results are obtainable from the use of stamps than rolls in the crushing of Boston Consolidated ore.

Several new suits were filed against the smelting companies operating in the Salt Lake valley during the past week, the plaintiffs in the cases being farmers residing on, and owners of, lands, in the vicinity of the plants, who claim they have been injured by reason of fumes. This question is still one of deep concern to smelting companies, as well as to the farmers.

DENVER, February 17.

Philip Argall is making the plans for remodeling the Golden Cycle mill, formerly the Telluride mill. The Golden Cycle Mining Co. is augmenting its mining facilities to handle a larger tonnage, which will be shipped to this mill. Among other improvements a large air compressor will be installed, ore skips will be used auxiliary to cage-hoisting, and electric haulage will be applied on the surface from shaft to ore-bins and waste dump.

The Akron Mining Company, of which Senator Charles Dick of Ohio is president, owning the May-Mazeppa mines in Gunnison county, will soon re-commence active operations. On October 19, 1904, the shaft on the May claim, containing the hoisting and compressor plants, was destroyed by fire. The company will re-build and re-establish the machinery on an enlarged scale. The crosscut, which was run 4,000 ft. to the May lode, encountered a blind vein 19 ft. wide between walls. The entire width is mineralized and may be handled at a profit. The vein was cut 460 ft., vertically, from the surface and is named after its width, the '19-foot' vein. Some development has been done on it, disclosing masses of ore carrying 30% lead, 32 oz. silver and ½ oz. gold per ton. The company is outlining plans for handling a large output. The mill capacity, now 40 tons, will be greatly increased.

The successful outcome of a number of the deep tunnels of Clear Creek is giving a new impetus to mining in that county. One of the most important of these is the Two Brothers tunnel which, on January 7, cut the Specie Payment vein at 1,200 ft. on its dip below the collar of the shaft, disclosing four feet of pay ore equal in value to the rich sulphide of the upper levels. Between 300 and 600 ft. in depth the vein lost its continuity, split up into feeders and yielded comparatively little ore. Production began from the tunnel level as soon as the vein was cut.

The Gem Consolidated Mining Co. is working the Gem vein through the Newhouse tunnel at a depth of 1,500 ft. from the surface. In the upper workings the ore is a copper-iron sulphide carrying gold and silver, the greater value being in gold. At 1,500 ft. high-grade ore containing sylvanite has largely replaced the pyrite. The ore mined at this depth for the same width is said to be much richer in gold than that of the upper levels.

The Ross Mining & Milling Co., operating in the San Juan country, with main office at Silverton, has secured the Kendrick smelter at Silverton. As soon as the necessary repairs can be made, the smelter will be started on ores from the Champion, Gallie Boy and other properties controlled by the Ross company. If the operation of the smelter proves a commercial success, the plant will be enlarged to handle custom ores. The Kendrick smelter was built to matte the ore of the Henrietta mine and under the management of E. W. Walter, formerly with the American Smelting & Refining Co. in old Mexico, was both a metallurgical and financial success. The mine, on account of limited development, did not furnish the tonnage required for continuous smelting, and after running intermittently for two or three years the smelter was closed. Last fall Mr. W. L. Hoyt, formerly superintendent of the Globe smelter refinery at Denver, and for four years general manager of the Smelting & Refining Co., of Australia, near Sydney, made an examination for the Ross company. Mr. Hoyt will take charge of the smelter at once for the company. For the present the work at the smelter will be confined to making matte.

ARIZONA.

The Arizona Miners' Association will hold its first annual meeting at Bisbee on April 9.

Cochise County.

The Advance Development & Mining Co., of Bisbee, is sinking a two-compartment shaft to a depth of 200 ft. on its claims, three miles from Bisbee.——W. L. Worley is having the plans drawn for a five-stamp mill to be erected on the mine of the Mesa Rica Gold Co., at Sahuaripa, near Douglas.

Gila County.

The Old Dominion, at Globe, has three furnaces running and making a heavy output. The extension to the smelter building has been completed and all is in readiness for the fourth furnace, which has been shipped. Work is progressing on the 40-ft. extension to the flue-dust chamber. The concentrator, rated at 300 tons, has recently been treating 400 tons of ore daily. The addition to the plant now building will double its capacity. Mines in the Globe district which produced high-grade silver ore in the early days are now being tested at depth for copper values with gratifying results. Some of the old-timers will soon be more profitable when worked for copper than they were for silver.

Graham County.

The Bonito Copper Co. will erect a leacher on its property, near Safford.——The Detroit Copper Co. is constructing electric transmission lines from Morenci to various properties near Metcalf. Development work at the mines will begin as soon as the new power is turned on.

Mohave County.

Hall Bros. have placed a new hoist at the Alger-Tobey mine, in the Great West section, near Kingman, and will sink a shaft.——The German-American Mining Co., whose mines near Kingman were closed down a few weeks ago, owing to the failure of the water supply, will put in a pipe-line and power machinery to convey the water from Spears lake, nine miles distant. Steam power will re-place gasoline at the principal mines and a compressor will be put in for the operation of machine drills.——The owners of the Minnesota-Connor property, near Kingman, are preparing to resume operations and will sink a shaft from the 500-ft. level.——It is announced by the owners of the Oro Plata mine, near Kingman, that the main shaft will be sunk to the 500-ft. level, from which point drifts will be run.——Preparations are being made to sink the main shaft of the Rico mine, near Kingman, to the 200-ft. level, where crosscuts and drifts will be run.——The smelting plant at the mine of the Arizona-Mexican Mining & Smelting Co., at Stockton Hill, near Kingman, began operations on February 9.

Pima County.

The old Mammoth mine, which has been abandoned for nearly four years, will become an active producer again, according to F. Carr, of Tucson, who says that C. W. Johnson expects to re-open it. Mr. Johnson was manager of the Mammoth mine 10 years ago. When he resigned George. B. Blair was appointed in his place under the English syndicate. Mr. Johnson believes the old Mammoth still capable of producing. Mr. Carr is mining in the Tucson mountains. He says that a tunnel is being driven, over 200 ft. of it now completed.

Pinal County.

P. B. McCabe and others are building a custom smelter on the Gila river, above Florence. A lead furnace has been set up and a 50-ton copper jacket is being put in.——The Troy-Manhattan Co., at Troy, report having broken into a large body of chalcopyrite ore on the 500-ft. level at the Buckeye mine.——The Rescue Copper Co. is equipping the Ajo mine, near Florence,

with a 50-ton smelter, which it is expected to have in operation within 60 days.

Santa Cruz County.

R. E. Doan and others have ordered a 15-stamp mill for the Pearce property, four miles from Patagonia. The mill will be similar in construction to that operated by Mr. Doan on the Vanita mine.

Yavapai County.

The Gold King Mining Co. is preparing to push its tunnel, now in 420 ft., to 800 ft. on its mine in the Bradshaw mountains, near Poland. A new air compressor has been ordered.

P. A. Johns, of the Alvarado mine, at Martinez, states that it will require about 50 days to unwater the mine at the present rate. Mr. Johns has under consideration the installation of a reduction plant at the mine. ——The Rincon Mines Co. has ordered a 125-h.p. engine for its mine, near Martinez.

M. H. Ryan, superintendent of the Wisconsin-Arizona Mining Co., states that he is arranging to begin work on the company's property in the Turkey Creek district, four miles north from Poland.

R. C. Houston, lessee of the Olden mine, in the Weaver district, near Octave, is driving a drift from the 185-ft. level.

CALIFORNIA.

Amador County.

The mill and all underground work at the Oneida mine, near Jackson, have been stopped, and for the time being only exploration work will be done. A winze will be sunk to the depth of 1,000 ft. from the lowest level, in the hope of finding a better grade of rock.—— The mill at the Mitchell mine, near Jackson, has been shut down temporarily, owing to the breaking of the 6-in. cam shaft.

El Dorado County.

Collins & Bacchi have put in a new whim, car and skip at their mine, near Georgetown.——The shaft at the Rosencrans mine, near Placerville, is now down 370 ft. It is the intention to sink below the 400-ft. level and crosscut to the ledge.——The old shaft at the Mount Pleasant mine at Grizzly Flat is being unwatered preparatory to sinking 200 ft. deeper, to the 1,000-ft. level. ——At the Sherman mine, near Placerville, sinking has been resumed. It is the intention to sink to 400 ft. and then crosscut to the ledge.——W. P. Carpenter & Son have bonded their gravel mine, near Smith's Flat, to a Colorado firm to be developed under management of J. Swansborough.——Smith & Coster are to put in a four-stamp mill at their mine below Georgetown. The machinery is at Auburn and will be placed as soon as the weather will permit.——The Standard Unit mine, at Coloma, will be started up this week. Water was turned on to try the pipes a few days ago.——The New Highland Co. is making arrangements to resume work on the Mameluke Hill mine, near Georgetown.

Kern County.

The Orphan Girl mine, near Randsburg, has been sold to Chanslor & Canfield, of Bakersfield, who state that they will put in new machinery and begin working the mine.

E. B. de Golia and other new owners of the tungsten mines, near Randsburg, have arranged to ship the low-grade ore from the mines to the mill at Barstow.——The St. Elmo, near Randsburg, has re-opened with C. S. Pillor in charge.

Mono County.

R. V. Crowell has bought from J. M. Carney the Alamo mine at Little Antelope Valley, near Bridgeport. ——T. V. Whitelaw, of Masonic, near Bridgeport, has bonded the True Friend, Toughnut and Astersion claims near Masonic.

E. S. Smith, of San Francisco, has taken a bond on the Consolidated Pacific, owned by T. Colligan; the Midnight and Flagstaff, owned by T. and J. S. Cain, and the New Standard, owned by Mrs. Belmont and J. Long. The bond calls for $12,000 worth of work to be done in four months, $1,000 per month on each group. At the expiration of four months, if the sale takes place, the owners will receive about $50,000. Mr. Smith expects to commence work by February 26.

Nevada County.

W. Howard and Robert Kemp, of Grass Valley, will run a tunnel at their claims in the French Corral district, northwest of Grass Valley. They have recently taken up eight claims in that section.——The president and superintendent of the Brunswick Consolidated Gold Mining Company, near Grass Valley, recommended the re-placing of the present mill with a modern 20-stamp mill, and the installation of an electrical hoist, the latter to cost about $2,000.——The sand plant at the Central Consolidated mine has been completed, and arrangements are now being made for the installation of an electric hoist. Seven settling boxes have been added, and an addition has been made to the mill house, for use in drying and housing sulphurets when bad roads interfere with transportation.

Work has begun on the extension of the Central Shaft by the North Star Mines Co., near Grass Valley. Sinking has commenced at the 1,600-ft. level, where the vein will be followed to a depth of 3,000 ft. additional. Levels will be turned every 300 feet.

J. Ghimalli, John Gono, J. Jacum and John Jacniutti, workmen at the Delhi mine, near Columbia hill, were arrested on February 15 charged with the theft of 300 lb. of specimen ore, valued at $2,500, from the strong box at the mine. Small specimens of ore were found in the bunks of each of the men, and it is believed that the bulk of the stolen ore will be found hidden near the mine.——H. C. Cloudman reports the arrival of a drilling machine, weighing 7½ tons, at Youbet to be used in prospecting the banks of Greenhorn creek in the interests of the lessees of the J. S. Goodwin gravel property, near Youbet. In case results are favorable a dredger will be installed.——The electric hoist at the Sultana mine, near Nevada City, is being installed and sinking will be resumed. A site is now being cleared for a 40-stamp mill.

Plumas County.

J. M. McClung has purchased the Caledonia group on the South Branch of the Feather river, six miles east of Cascade Valley.

San Bernardino County.

The Needles smelter was blown in on the 10th inst. and since that time from 30 to 100 tons of ore has been reduced daily, making bullion valued at about $4,000 every 24 hours. The plant was erected by the Arizona-Mexican Mining & Smelting Co., under the management of L. D. Godshall. Mohave county mine owners now have a market for their low-grade ores, the rate to the new plant being made to allow of the shipment of ore that could not be handled under old conditions. The company has mines in Mohave county capable of supplying 25 tons of ore daily. These mines will soon be making their maximum output, as the mill is about to be erected to handle the low-grade ore from the mine and ship in the form of concentrates. The remainder of the ore will be supplied by custom ores.

D. P. Kendrick is repairing the Sloan mill, four miles from Daggett, preparatory to operating it on ore from his mine near Calico.——Samuel Slokum is arranging to open the Edna and Gold Chief mines, near Barstow.—— The Dry Lake Mining & Milling Co. has begun drifting at the 170-ft. level on the Fortuna ledge at Dry Lake, east of Victorville.

C. P. Dunn, president of the Red Hill Mining & Smelting Co., states that the company's mill, 12 miles east of Victorville, will open on March 1. At present he is trying to develop a water supply in the bed of a dry lake near the mine.

San Diego County.

Repair work at the High Peak mine at Julian, which was damaged by the recent cave, is about completed.

Siskiyou County.

Work will be resumed at the Eliza mine at Humbug, near Yreka, on March 1. A cyanide plant will be installed early in the spring.——Carter & Taylor, owners of the Empire mine on the Klamath river, near Yreka, are constructing a boom and will hereafter float fuel to their mine.——The Graham Consolidated Mining & Development Co. is preparing to instal pumps and mechanical elevators at the Garvey Bar mine at Garvey Bar, near Yreka. Water power will be used.

P. L. Young and others, operating between Virgin and the head of Eagle creek, are negotiating for an aerial tramway and preparing to put in an electric plant on the creek below their mine.——A 400-ft. tunnel is being driven on Horse Shoe Bar by Supt. Lindsey, of the Horse Shoe Bar mine, to turn the water of Trinity river from three-fourths of a mile of river bed. Machinery will be put in to pump out the holes in the bed, and two strings of 16-in. pipe will be laid to carry water from the dam to the scene of operations.——F. P. Burris is putting in a mill and bucket tramway on his property, near Burris.——The Quartz mines, on No Nothing creek, which have been idle during the winter, are now resuming work.——W. R. Dowell, superintendent of the Malloy quartz mines, on Tanner's peak, near Sawyer's Bar, is raising 140 ft. to the surface from the lower level, and is planning to instal a milling plant in the spring.—— The Fernandes Hydraulic mine, on Cherry creek, began operations last week, though the water supply is still light.——The mines near Orleans now have plenty of water and work is being resumed.——Derricks and machinery have been installed at the Ten Eyck and Hickox mines for handling boulders.——Night and day shifts are operating at the Salstrom mine, at Orleans. ——L. P. Puter, H. L. Ricks and H. S. Hinzie, of Orleans, are planning the erection of a small mill at their mine on Orleans bar.

A two-step centrifugal pump, capable of handling 500 gal. per minute, and an improved hoist will be installed at the Blue Gravel placer mine, 1½ mile from Yreka. The old equipment will be used in clearing out the mine and in keeping it clear until the new pump can be set. Steam power will be used, one 60-h.p. and one 40-h.p. boiler being employed.

The new owners of the Big Slide placer claims on the mouth of Deadwood creek, near Yreka, are putting in machinery. Centrifugal pumps will be used to raise water from the creek bed for use in hydraulicking.—— John Koob is sinking a shaft on the ledge at his claim, two miles west of Yreka.

Santa Barbara County.

A shaft has been sunk a short distance on the Coats Ranch in Santa Barbara, where a find of gold was reported last week, but further development will be delayed until plans can be completed.

Sierra County.

The drain tunnel at the Alaska mine, at Pike City, has tapped the shaft, and the mine is now drained to the level of the tunnel.

Solano County.

Another shaft is being sunk at the St. Johns quicksilver mine, five miles from Vallejo.

Trinity County.

Robert Foster, of Arcata, president of the New River, Panther & Quimby Creek Mining Co., states that the company is prepared to build a mill on its mines, near New River, in this county.——The Trinity County Hydraulic Gold Mining & Milling Co. is sluicing on its property, near Weaverville, and uncovering stringers to the main ledge. They are contemplating putting in a Huntington mill during the summer. E. P. Campbell, of Eureka, Cal., is secretary of the company.

Shasta County.

The Mammoth Copper Co. of Kennett has placed its entire force on the eight-hour schedule.

Walter G. Van Matre has an option on the Black Oak mine at French Gulch and has contracted to run a tunnel 230 ft. below tunnel H, work to be begun within 60 days.——The Balaklala Co. has plans drawn for the construction of a hotel at Balaklala, near Kennett, to accommodate 200 men. Construction work on the 1,000-ton smelter is to begin on March 9. A spur track to connect the works with the Southern Pacific tracks is being surveyed, and the pipe-line from Cottonwood creek is about completed.

Trinity County.

Frank Burris and others are putting in a new engine and other machinery at the Bear Tooth mine at New River.——J. A. Brent is in San Francisco, figuring on a Huntington mill for the Birdie M. mine, near New River.

Tuolumne County.

The Duleek Gold Mining Co. has bought the Duleek mines Nos. 1, 2, and 4, five miles northeast of Groveland, for $12,666.——Gribble & Shiels began running their *arrastre* near Tuttletown this week.——J. A. McDonald has bonded the mineral rights of the Ida Klein ranch, near Stent, and will begin devopment.——Charles Gillis has completed his new 3-stamp mill on the Chileno mine, near Sonora. It is operated by a 10-h. p. gasoline engine.

Chas. E. Connally is reported to have sold to J. D. Fleming, of Humboldt county, a two-thirds interest in the Royal, formerly the Bonanza mine, near Sonora.—— The Voinich 40-stamp mill, at Angels Camp, is completed and began operations Feb 17. The shaft at the mine is down 800 ft., and ore is being taken out on the 600, 700 and 800-ft. levels.——A large hoist is being installed at the New Albany mine, near Carter's.

COLORADO.

(Special Correspondence).—Excitement prevails here owing to the arrest of Moyer and Haywood, of the Western Federation of Miners, on Saturday, at the request of the Idaho authorities. Orchard, the party under arrest at Boise, Idaho, for the murder of ex-Governor Steunenberg, is reported to have made a confession and implicated the officials of the Federation. Requisition papers were honored by Governor McDonald of this State, and the parties arrested were taken to Idaho by special train under armed guard to prevent any attempt at rescue by friends of the accused. A man named Pettibone was also arrested and taken to Idaho with the Federation officials, as being implicated in the affair.

Denver, Feb. 19.

Clear Creek County.

The record of the Mendota mill at Silver Plume, last year, shows what may be done with the low-grade mines in that district. Stephens & McGrath, who are operating the mine and mill under lease, make the following statement of their business for the year 1905: Tons of zinc shipped, 870; tons of lead shipped, 257; tons of iron shipped, 483; total, 1,610 tons. The value per ton was: Zinc, $31.35; lead, $51.48; iron, $10.50; total gross value, $45,576.36. There was paid for freight and sampling, $3,414. The cost of mining and milling was $14,480.15, and $4,441.62 was paid as royalty, leaving a net profit for the lessees of $23,231.59. An average of 50 tons of material per day was handled, some of which was from old dumps, some from the old stopes in the mine, and the remainder was low-grade zinc and iron ore that had been left in the mine when it was worked for the lead product. Three men on a shift, working eight-hour shifts, are employed in the mill. A much better record, it is thought, will be made this year, as included in the cost of mining and mill as given above, was a great deal of dead work, getting stopes in shape for running and timbering, so that streaks of zinc could be mined, which will result in a larger output of concentrates.

Gunnison County.

The Daisy group, in Redwell basin, is to be operated another season. This property produced a large amount of silver lead ores some years back, and, it is reported, a good showing of the same ore is to be seen in the property now.

The new mill at the Maple Leaf mine is nearing completion. A large amount of ore is broken and a larger tonnage is said to be blocked out in the mine.

Lake County.

The Hattie Clark group, adjoining the Alps, in South Evans gulch, Leadville, has been leased to a Pennsylvania syndicate, which has also an option. It is the intention to sink a new shaft from the surface, which is expected to find the ore-shoot west of the fault that runs through that section of the hill.

The Silent Friend, in the same section, has resumed work and the shaft will be deepened. The ore-shoot above pitches into Little Ellen hill.——It is reported that T. Goodwin has disposed of his interest in the New Monarch group and J. B. McDonald has been appointed superintendent.

The new lessees on the little Jonny, at Leadville, who recently purchased the Harvey lease, have started to move the zinc ore and it is now going out at the rate of 50 tons daily. The average value of the zinc is 35%. Large quantities of iron are being shipped from different properties on Fryer hill, and, as none of this iron runs less than five ounces silver per ton, with an excess, the men are doing well, with silver at its present price. From the Chrysolite about 100 tons daily are being shipped by the lessees, and from the Dunkin, Matchless, Little Chief and Little Pittsburg about the same amount goes out daily.——The new mill of the Damascus Mining & Milling Co. is completed. The initial run will be made on ore from the company's property on Mosquito and after that custom ore will be handled.

La Plata County.

The Southern Pacific Railway continues to acquire coal-land in this county, having just consummated a deal for 2,000 acres lying near the Perin's Peak property, bought a few days ago by the Rio Grande.——The latest purchase by the Southern Pacific is separate from the recent purchase of the 20,000 acres from the Porter Fuel Co. A large portion of the money is said to have been paid and deeds are being recorded. The price is reported to be over $100,000, making a total of about $850,000 the Southern Pacific Co. has spent for coal-lands in this county within the past two weeks.——The Southern Pacific recently completed a survey for a line from its main line in Arizona to Hesperus and Durango, and has secured practically all the right-of-way, and the acquisition of this coal-land by the two railroads assures the development of the bituminous coal in southwestern

Colorado. Much of the coal has good coke-making qualities, and it is reported that the new owners intend to erect coke-ovens near Porter to treat 3,000 tons of coal per day.

Ouray County.

In the city limits of Ouray is the Mineral Farm group of 240 acres, in which a strike of silver-lead ore was made in the Midnight recently. This group is one of the oldest in the camp and has been worked at intervals for years, with varying success. Heretofore no attempt was made to explore at depths the lime in which the workings are located. It was the opinion of Mr. Dupraw, the superintendent, that the principal bodies of ore would be found at greater depth. Twenty feet of the shaft is in ore. The ore is in the bottom of the shaft and on all sides of a chamber 30 ft. square. The indications are that an east and west fissure vein has been struck and that it follows a porphyry dike which cuts through the lime. The chamber at the bottom of the shaft has produced 80 tons of high-grade ore, and 250 tons of mill ore, which is in the dump, where it will remain until the mill can be started next summer.

Park County.

George Sheldon, an old-time prospector and miner, has during the last three months been tracing the source from which pieces of rich copper float found in the district came, and has located the ledge and followed it for over 3,000 ft. on the surface. In four cuts made on the vein he has ore from 7 to 63%. The ledge dips at 45° and improves in width and values with depth. A number of claims have been taken up and one syndicate has 200 acres.

Teller County.

A rich shipment was made recently by Lessees Gillespie, Bruington and associates from the Old Gold estate, on the west slope of Beacon hill, being less than three tons of ore, but it is expected that the shipment will net close to $10,000. About a quarter of a ton of the rich sylvanite and quartz was alone estimated to be worth $15 to $20 a pound, gold value, and is believed to also carry high silver values. The lessees took hold about two months ago and have been mining ore almost from the start. They have opened up in virgin ground, north of the shaft, at the 400-ft. level, an ore-shoot six feet in width, carrying rich streaks of sylvanite. One of these streaks yields an almost solid seam of telluride ore, from one to nearly three inches across.

The annual report of the Portland Gold Mining Co. for 1905, and issued Feb. 5, 1906, shows that 100,986 tons of ore were produced and shipped to the company's mill at Colorado Springs, having a gross value of $2,373,600.14. In addition to this there were 8,246 tons of low-grade ore shipped from the dumps of the company's mines. This was worth $48,433.28, making a total of $2,422,033.42. The net profits from all sources for the year to Dec. 31, 1905, were $881,275.56. The manager's report shows that during the year 19,982 ft. of drifts and crosscuts were run, at a cost of $4.614 per foot. The raises, a total of 970 ft., cost $5.60 per foot, and of shafts and stations, 120½ ft., $17.526 per foot. Stoping cost for breaking 72c. per ton, 342,969 tons being broken. Timbering in stopes cost 41c. The general expense was but 21c. per ton. The total mining expense was $2.096 per ton of crude ore; of freight and treatment, $2.05 per ton; total operating cost, $4.2245 per ton, and $14.426 per ounce of fine gold produced. ——John Sharpe, operating several properties in Cripple Creek district, has again struck it rich, after having a lease about seven hours. Recently he purchased the lease of H. Richmond & Co., on the Aileen claim, located between the Mary McKinney and Chicken Hawk properties, on Guyot hill. The amount paid was $9,700. Men were put to work within a week, a rich vein being opened. The pay streak is 2½ ft. wide and returns from $200 to $250 in gold to the ton. The mineral is a dark granite, carrying sylvanite.

IDAHO.

Ada County.

Three raises have been started from the west drift of the tunnel level at the Big Giant mine, 12 miles from Boise.

Boise County.

J. T. English, of the New Century Mining Co., has bought supplies and has sent men to the company's mine at Twin Springs. W. H. Jackson, formerly foreman of the Friday mine, at Pearl, has been made foreman of the New Century.

Elmore County.

D. W. Shelter and Mr. Spranger are preparing to start up the Canton Gold Mining Co.'s dredge, on the Snake river, above Glenns Ferry.

Idaho County.

Late developments of the Buster mine, near Elk City, it is said, show the body of ore to be 200 ft. in length, 100 ft. of which has been crosscut, showing 22 ft. of solid ore. The drift has developed the ore on the foot-wall side of the vein, 100 ft. of which sampled showed $30 per ton. Fifty per cent of the values are free and the remainder is concentrating ore. The last 100 ft. drifted on the same character of quartz, but not uniformly mineralized, but assays $10 per ton. Along this vein the surface outcrop shows quartz 60 ft. in width, with the best values on the hanging-wall side.

Shoshone County.

The course of the tunnel now being driven at the Phœnix mine, near Burke, has been changed, in order to follow the course of the hanging wall. The tunnel is now in 217 ft.——The Champion Copper Co. is making arrangements to resume operations on its two claims, five miles southeast of Mullan. The main drift will be continued to a point vertically underneath the principal surface showing.

Washington County.

The Hancock Copper Mining Co. is to put in a new process reduction plant, including boiler, engine, crusher, rolls and a series of tanks at its mine near Cuprum.

R. H. Hillen, president of the Syndicate Mining, Milling & Smelter Co., has begun work on a tunnel on its claims, near Weiser, which is expected to cut a ledge at a depth of 250 ft. The company is arranging to ship ore down the Snake river.

MONTANA.

Beaverhead County.

J. J. Sullivan, of Butte, reports having a lease and bond on copper claims, near Argenta, and that some of the ore will assay 16% copper and considerable silver. In addition to the Argenta claims, he says he has an option on a group of four claims in the Blue Wing district, five miles from Bannack, and that silver ore was shipped from this property to Swansea, Wales, in 1868.

Deer Lodge County.

The Washoe Smelting Co., at Anaconda, has ordered electrical equipment aggregating 259 tons for its 10,000-ton concentrator. This includes dynamos weighing 40 tons each.

Madison County.

C. Austin, of Butte, has sold the 100-ton roller mill on the Red Bluff group, at Red Bluff, to the Minneapolis company now operating the Mammoth property at Mammoth. It was built three years ago for the Red Bluff mines, but was operated only six weeks. It is the intention to transfer it to the Mammoth. Additions will be made, including a cyanide plant.

Missoula County.

The air compressor and other machinery for the Montana-Standard mine, near Thompson, have arrived and are now being placed. The lower crosscut tunnel, which has been driven 500 ft., will be extended 900 ft. further, to the ledge.

Silver Bow County.

(Special Correspondence). — The settlement of the Heinze-Amalgamated copper war will result in the re-opening of a number of mines that have for years been closed by injunction, and an increase of the Butte copper production by several million pounds per month. The transfer of Heinze and United Copper interests to Thomas F. Cole, for the new company that is to be organized, has been completed. All the interests in Butte owned by Heinze and his associates, with the exception of the Lexington group, the Nora mining claim and interests in the mining property and real property of the Davis estate, have been transferred by deeds recorded in Butte. It is announced that in a short time counsel representing the Amalgamated and Heinze will go into court and have dismissed the 100 or more suits now pending, which involve claims for more than $50,000,000 damages. With the dismissal of the mining litigation, more than one-half of the business of the three departments of the district courts will have been disposed of, and fully a third of the litigation that has been occupying the attention of the Supreme Court.

Drifting is being done on the vein opened on the 2,200 ft. level of the Anaconda mine and the ore throughout the workings is as rich as that at the point where the vein was cut. The vein is 50 ft. wide and a big portion of it is copper glance. Good progress is being made on the crosscut on the 2,400 level, and it is expected that the vein will be cut at that depth in about three weeks. A vein 4 ft. wide, containing 2½ ft. of copper glance, was found while driving the crosscut, but no development has been done on it. It is surmised that the vein is an enlargement of a stringer that was mined on the 2,200 level.

J. Parke Channing has been in Butte for a week representing the Lewisohns of New York, who are interested in a lease and bond on the Amazon group, southeast of the city, and lying just south of the Pittsburg & Montana Company's mines. Three or four of the mines have been slightly developed and good copper ore has been taken from some of them, but the ore was found in pockets and not in continuous bodies. Mr. Channing has placed machinery on the Altoona, one of the group, and will examine the old workings. After that he will have the Amazon shaft cleaned out and make an examination of that mine. If his report is favorable, the options will probably be taken up by the Lewisohns. It is the intention to sink a new shaft at a more accessible point and develop the claims from that shaft.

The Butte & St. Louis Mining Co. has been organized by Butte and St. Louis men for the purpose of developing the Kessler mine, an old silver and gold property, lying northwest about 1,000 ft. from the Alice mines. Years ago the Kessler produced a great deal of gold and silver and it has some good copper indications. The company is capitalized for $600,000.

Still another new company recently organized is the Butte & Bacorn, which filed articles of incorporation in Augusta, Me., a week ago. It is capitalized for $5,000,000 and its purpose is to explore a lot of new ground far northeast of any developed mines of the Butte district. Its ground comprises about a dozen recent locations along an outcrop.

The Butte & London Copper Mining Co. is making good progress in sinking a shaft on the Greendale claim. It has reached a depth of 60 ft. and some fine ore has been cut. No water has been encountered and all the usual difficulties and hindrances have so far been absent.

Through the efforts of some Butte men to 'boost' Anaconda stock, a false report was sent out from Butte about a week ago to the effect that the big vein for which the company is now working on the 2400 level had been cut. The report pretended to give exact measurements and values of ore in different parts of the vein.

Butte, Feb. 19.

NEVADA.

Elko County.

G. Knutzen has been developing the Old Bullion, 28 miles south of Elko. Mr. Knutzen says that he feels justified in starting in on an extensive scale. Development work exposed orebodies of value.——The Edgemont mill at Edgemont, which was seriously damaged by a snowslide a few weeks ago, has been repaired and is again working to its full capacity.——C. H. Spooner is figuring on erecting a mill at the Dexter mine, near Tuscarora, for H. H. Mayham of Denver and his associates.

Esmeralda County.

M. J. O'Meara and T. J. Lynch are buying equipment for the mine of the Silver Peak-Valcalda Gold Mining Co. at Silver Peak. The equipment will include a ten-stamp mill, pumping plant and piping for a four-mile pipe-line. Water is now being developed three miles from the mine. This will be lifted 800 ft. in order to secure a gravity flow to the works. It is hoped to have both mill and pumping plant completed early in May.——The Goldfield Tule Canyon Mining Co. is now down 70 ft. on the Ingols mine at Tule Canyon, near Goldfield, and has arranged to continue sinking.

Lincoln County.

(Special Correspondence).—The new 10-stamp mill of the Searchlight Mining Co., at Searchlight, is completed. The mine is 300 ft. deep. The mine makes about 75,000 gallons of water daily, which will be used in milling. The pumping is done by compressed air, the compressors and all other machinery being operated by gas-engines. The camp is 30 miles from Nippon, on the railway. —— The Quartette mine, 18 miles west of Searchlight, is 900 ft. deep. It is equipped with a large hoist. The mine water is used here also in the mill, the tailings being settled and the water pumped back for re-use. —— The Cyrus Noble mine, at Searchlight, has completed its 10-stamp mill. This mill is of unusual type in California. It came from Georgia. The boss-heads are fully 30 in. long, the stampheads are 7 in. diameter, and the stems 3¾ in., the whole weighing about 800 lb. They drop 80 times per minute.

Searchlight, Feb. 19.

Nye County.

The Lucky T. Mining Co. is driving a tunnel to intersect two ledges on its mine at Orrville, forty miles south of Bullfrog.

The Tonopah-Wall Street Mining Co. announces that negotiations are pending for the purchase of a steam hoist, preparatory to sinking a main shaft to the lode porphyry, from which crosscuts will be run. The estimated depth of the shaft is 540 feet.

Storey County.

A cave recently occurred at the collar of the Ophir shaft, carrying out several sets of timbers. Since then the gallows frame has been secured, the cave cleaned up and timbers re-placed.——The Ward shaft at Gold Hill is now open and in good condition to 2,369 ft., this having mostly been accomplished since the summer of 1904. ——The tail-rope system of winding has been installed at the Union shaft.

Washoe County.

Mr. Clapp, manager of the Willow Creek Mining Co., states that the company will put in a 200-ton mill and concentrating plant on its property in the Washoe district, 12½ miles from Reno.——A rich strike is reported as having been made in the Desert King mine, where ore assaying a hundred dollars per ton was uncovered by Mr. Ramsey, the leaser. Two weeks ago a strike was made on this property, but this latest find was made by a single shot. Governor Sparks and his associates four years ago took charge of the Wedekind property. Soon afterward the vein pinched. Instead of abandoning the property, Governor Sparks erected reduction works and began developing. The work continued until the find just made.

White Pine County.

The owners of the Uncle Sam group at Bald mountain have contracted with Fred Blank to construct a dam 160 ft. long and 12 ft. high to conserve water for placer mining in Water Canyon. They have also placed orders for ore cars and track for use at the quartz mines. Elko, Elko county, will be the shipping and supply point for the mines.

NEW MEXICO.

Colfax County.

Work has been resumed on the Lynch mines at Elizabethtown, after an idleness of several years. C. J. Gibson and J. Murphy, of Philadelphia, have an option on the property. A. P. Hunter, of Wallace, Idaho, will be manager, and M. Cawley superintendent. The property is also known as the Red Bandana group. Over 2,000 ft. of development work has been done. A five-foot Huntington mill, engines, boilers and shaft-house are on the property. The formation consists of granite and metamorphic rocks. Near the surface the ore is free milling, but changes to sulphide at depth. The Huntington mill is to be re-placed with a 50-stamp mill, as it is believed by that method the free-milling ore can be treated at a cost of $4 per ton. The new owners paid $165,000 for the property.

Santa Fe County.

The owners of the Keystone mine at Cerillos, are retimbering the shaft and preparing to put in new machinery, a portion of which has arrived.

OREGON.

Coos County.

T. C. Archer states that he will build a 100-ton smelting plant, to cost $50,000, on Coos Bay, near North Bend.

Curry County.

E. H. Russell, of the Gold Bar Mining Co., of Illahe, says that the company will operate two giants on its placer ground this spring. About 3,200 ft. of pipe-line is being laid to carry water from the penstock to the mine. Electric power and light will be supplied to the property.

Baker County.

The management of the Tabor Fraction, at Bourne, reports having purchased an 80-h. p. motor for the hoist and a 50-h. p. motor for the mill. A hoist and an aerial tramway will be contracted for in a few days. Improved machinery for the mill will be purchased by Mr. Case in Denver.——One 6 by 16 in. rock crusher, one

4 by 12 in. rock crusher, several small pumps, piping and parts have arrived at the Imperial mine, near Sumpter. The larger breaker will crush the ores from the grizzlies to an inch size and the smaller one will crush the oversize from the trommel screens to ¾-in. size. The new boilers were put in place the past week.

Crook County.

E. Gatewood, of Prineville, representing the new owners of the Mayflower mine, near that place, is arranging to instal a five-stamp mill and a cyanide plant.

Josephine County.

Robert O. Towns, the new owner of the Blue Ledge mine, 40 miles from Grants Pass, states that extensive additions will be made to the plant and that the mine will be worked on a larger scale.

Jackson County.

The Homestake Enterprise Mining Co., of Woodville, has completed its connections with the Condor Water & Power Co. and is now operating a five-stamp mill by electricity.

Grant County.

Manager N. Berkeley, of the Buffalo-Monitor mine, at Granite, has let contracts for extending the lower crosscut tunnel to the Buffalo ledge and for extending the north drift on the Buffalo vein.

SOUTH DAKOTA.

Lawrence County.

Mine Inspector N. Treweek, of South Dakota, has issued his official report for 1905. It shows that the mines of the Hills are in good shape and well provided with safety appliances. The tonnage output of the mines for the year was 2,080,271, of which the Homestake handled 1,534,400 tons. The men employed in the mining industry was 3,549, of which number 2,800 are in the employ of the Homestake company. The total bullion value for the year was $7,191,533.71, of which the Homestake produced over $5,000,000. The production of the different companies was:

Alexander Maitland	$ 320 00 00
Clinton	10 704 74
Dakota	120,337 69
Gilt Edge-Maid	110,665 00
Golden Reward	391,350 69
Hidden Fortune	80,724 24
Homestake	5,080,000 00
Horseshoe	379,182 00
Imperial	251,000 00
Lundberg, Dorr & Wilson Cyanide	184,400 00
Portland	8,905 59
Spearfish	157,918 80
Wasp No. 2	86,324 96
Placer mining (estimated)	10,000 00
Total	$7,191,533 71

Majors, Dunlay, White & Fish, who have a lease on the Faust ground and the adjoining claims of W. L. McLaughlin on Blacktail gulch, near Deadwood, are running the Columbus mill on ore taken from that ground, crushing 40 tons of ore—the first that has been treated in the mill since it closed down several months ago. The ore is coming from a large, vertical vein, beneath the cement in the Faust ground. Hitherto the ore mined in this ground has been taken from above the slates, and is conglomerate.

UTAH.

During the year just closed various Utah properties produced 6,580,000 lb. of zinc, which represents a valuation of $383,282.40. Beside the Horn Silver mine, the State has several other zinc producers of importance, notably the Scranton, which soon will be shipping 50 tons of zinc-lead ore per day, and the Daly-Judge.

Piute County.

The new power plant of the Sevier Consolidated Co., near Junction, was started up on February 13. One hundred tons of ore per day are being treated.

Summit County.

The annual report of the Daly-Judge mine, near Park City, is of interest. It contains the following: "After a period of 23 months of development, from February 1, 1904, to December 31, 1905, it was decided to resume production of ore. All the work has been done on the 1,300, 1,400 and 1,500-ft. levels, amounting in all to 10,168 ft., which, with the exception of 130 ft. of upraises and a 70-ft. winze, consisted of driving levels and crosscuts. In doing this work many shoots of ore have been passed through, some of which give promise of developing into large orebodies when stoping is commenced on them, and a good part of the ore should be of shipping grade. On the 1,300-ft. level bodies of ore have been driven through, carrying values in lead, silver and zinc. These shoots are of sufficient strength to insure a good tonnage of ore. The 1,400-ft. level has been extended 1,600 ft. southwesterly into new territory, and it is on this level that most of the ore has been found, the character and value of which is much better than that developed in the old workings. Drifting is progressing on the 1,500-ft. level on the same vein as that in which the ore-shoots were encountered on the 1,400-ft. level, and has already passed through some orebodies of a good grade. There seems no doubt that this level will duplicate conditions as they exist on the 1,400-ft. level above, and which will make over 100 ft. of stoping ground. In the prosecution of this prospecting work a great amount of ore has been taken out and stored in the ore-bins and on dumps on a level with the concentrating mill, in all about 20,000 tons. This dump will serve as a basis of ore supply to the mill, thereby assuring a steady run at all times, as its operation will not be dependent upon the mine turning out a sufficient tonnage each day, if, for any unforeseen reason, it did not do so. We are now shipping from 35 to 40 tons of zinc middlings per day, ranging from $5 to $8 per ton. We have of this product an estimated tonnage of from 12,000 to 15,000 tons in the old dumps, while the mill will continue to make this class of product."

Forty men are now employed at the Ontario and conditions are said to be encouraging. A large volume of water rushed from the Ontario drain tunnel one day recently, the result of the removal of a mass of dirt and debris behind which it was banked. The men left the tunnel hurriedly, not knowing the extent of the flood, but returned to work when the flow had subsided. Work is going on as rapidly as conditions will permit and every precaution for safety is being taken. As the debris is being taken out the flow of water increases steadily, and it is thought that the water will drain completely away without another such violent rush as occurred there some time ago.

Sidney M. Bamberger of the Little Bell and Silver King Consolidated Mining Co. says that the new ore bins at the Little Bell mine are completed, and the accumulations of broken ore underground are now being moved out. At the King Consolidated mine the shaft has been sunk 50 ft. through a mineralized fissure and is now being continued to connect with the underlying quartzite.

Tooele County.

Superintendent Raddatz, of the Honerine, at Stockton, states that the connection of the shaft and drain tunnel has been made, but there are numerous preparatory devices which must be installed at the point of connection before the active hoisting of ore can begin.

Manager E. J. Raddatz, of the Honerine mine, at Stockton, states that the winze from the upper workings will connect with the tunnel level this week, after which the mill at the mouth of the tunnel will be put into commission.

WASHINGTON.

Chelan County.

The Red Mountain Gold & Copper Reduction Co. has taken an option on 32 claims in the Red Mountain district, near Leavenworth, and will begin development work as soon as the snow disappears. The Scandinavian-American Bank of Seattle is Washington agent for the company.

Ferry County.

The Quilp mine, at Republic, is now being opened and the machinery is being repaired preparatory to the resumption of active operations.——The Mountain Lion mine has resumed.

Okanogan County.

The Mineral Hill mine, at Conconully, has partially closed down, owing to the unsafe condition of the boiler.

Pierce County.

The Tacoma smelter has issued a statement showing that the value of all shipments received by water during January was $523,726.48. Of this amount, $514,388.96 was ore, $3,894.21 was lime rock, and $5,443.31 was general merchandise. The exports of furnace products by water for the month amounted to $441,210.42.

Snohomish County.

The owners of the Copper Bell mine at Roby have finished a chute from the concentrator to the bottom of the hill, a distance of 1,600 feet. Concentrates sent down this chute are loaded in tram-cars and hauled to the railroad.

The present winter at Darrington has seen more than the usual amount of development work in progress. Neiderprum & Bergeson have been at work on the Molly property, on Jumbo mountain, owned by L. O. Stubb, Knutson Bros., S. Bergeson and K. Neste. They are in 285 ft. and have struck a body of copper ore.——Ole Neste is doing assessment work on the Queen Anne mine.——It is reported that the Forest mine was sold in December to the Century Mining Co., which controls the Chickamun group. It is said that this company intends to erect reduction works at Darrington.

J. Dawson and J. T. Mellette have returned to the Trout Lake mine, near Index, with a crew of eight men to resume development. The tunnel is in 70 ft. on the ledge and will be driven 200 ft. before crosscutting. The party went in from Foss river on snowshoes.

Whatcom County.

Eighty-six miners, of the Mount Baker district, have associated themselves with the intention of building a smelter at or near Bellingham.

FOREIGN.

CANADA.

BRITISH COLUMBIA.

Boundary District.

H. H. Shallenberger has men opening a ledge of copper ore at the Moreen mine. For 150 ft. the trench shows good copper-gold ore. The cut is being made through decomposed rock, and no blasting is necessary.——Recently in drifting at the 350-ft. level of the Brooklyn mine, the ore-shoot, lost by a former management, has been re-discovered.——The Granby Company has taken a working bond on the Pathfinder group, up the North Fork of Kettle river. Men have been sent to the property to begin operations.——Acting on behalf of New York capitalists, George McLeod, has concluded negotiations for the group of claims consisting of the Ophir, the Gloucester, the G. H. and the G. H. Fraction, situated between Gloucester and Franklin creeks, 45 miles up the North Fork of the Kettle river.

The six smaller furnaces of the Granby Consolidated Co.'s plant at Grand Forks are to be enlarged, increasing the capacity to 2,700 tons daily.——A rock crusher with a maximum rated capacity of 3,000 tons per day has arrived at Phœnix for the Granby mines, to replace the one destroyed last December. A 250-h.p. electric hoist will be installed at the mine. —— At the Gold Drop mine, near Phœnix, new ore bins, a 600-ft. tramway and a track connecting the mine with the Canadian Pacific Railway have been put in.——Knight & Stone, of the Spokane Diamond Drill Contracting Co. have begun work on a contract to bore 1,000 ft. of holes on the Betts and Hesperus claims near Phœnix.

East Kootenay District.

The machinery for the Black-MacKay Mining Co. has been ordered. It consists of a seven-drill compressor, 100-h.p. boilers, two pumps, a hoist and two drilling machines.——Michael Sullivan is making a shipment of two or three carloads of ore from the Aurora mine, on the west side of Moyie lake. The ore will be shipped to either the Nelson or Trail smelters. It is being hauled from the mine on the ice at Aldridge to be loaded.

Lardeau District.

There is talk among the owners of the Broadview of stocking it and controlling it locally.——A vein of free-gold quartz five feet in width shooting off from the main lead has been discovered in the west drift on the Del Rey, and is now being opened up. The vein is running parallel with the formation and merges into the main lead 20 ft. from the crosscut tunnel.——Operations at the Eva mine and mill resulted in a clean-up of $5,000 in gold and concentrates of an estimated amount of $500. This is the largest amount that has been derived from a month's operations for some time.——The lead on the Silver Dollar is being drifted on at both sides of the crosscut tunnel, 250 ft. from its portal, and the south drift is in 50 ft., while the north drift is 40 ft. in length. The drifts are being run along the hanging wall, and in the south drift a solid body of steel galena has been encountered.

Vancouver Island.

The smelter of the Tyee Copper Co. during January ran 12 days and treated 2,052 tons of Tyee ore, giving a return, after deduction of freight and refining charges, of $31,022.

ONTARIO.

The plan to electrically equip the first 120 miles of the Temiskaming & Northern Ontario Railway also contemplates the sale of electrical energy to companies along the line of road, as the power developed will greatly exceed that necessary for the line mentioned, sufficient, it is believed, to provide not only for extension in the future, but for the supply of light, power and heat to municipalities and industries along the railway. This surplus energy, it is proposed to sell to distributing companies at various points, so that the railway commission will not have the keeping of accounts and the other work entailed in selling to private consumers. The rates, however, would be fixed by the commission, thus preventing the holding up of the industries, individuals or municipalities buying from the distributing companies. A number of companies and individuals engaged in mining at Cobalt have already made application for the purchase of electrical power, should the Government authorize the railway commission to proceed with the project. The power to be used would be developed from the Montreal river.

MEXICO.

Chihuahua.

J. A. Creel, F. Fletcher and D. Goodale have blown in their copper smelter at Terrazas station——H. T. R. Cowell, manager of the Barranca de Cobre mine near Chihuahua, has placed an order for machinery.——Las Vigas Mining Company has decided to double the capacity of the concentrating plant at Las Vigas mine, near Coyame.——J. J. Watterson, of Chihuahua, is arranging to put in a concentrating plant at the San Martin mine at Uruachic. A contract for machinery has been placed.

Coahuila.

The Continental Copper Mining Co. has purchased two locomotives, a cog-wheel engine, and rails for a 75 km. narrow-gauge railroad for its mine at Panuco.

Durango.

The Mexican Central Railroad, it is said, will construct a branch line from Jimulco, Durango, on its main line, to the mining and smelting camp at Velardena, the chief enterprise of which is the new 1,000-ton smelter of the American Smelting & Refining Co. Engineers have been surveying the proposed route. If built, it is supposed that a train service would be inaugurated over it between Torreon and Velardena. Communication between these two points is now over the main line of the Mexican International Railroad from its station at Pedricena.

Jalisco.

Walter R. Hazel, formerly of Guadalajara, has been made superintendent of the Bolanos mines, near Jalisco, and he will instal a hydro-electric plant on the Bolanos river to furnish power for operating the pumps.——The Mexico Union Mining Co. has installed a Dodge crusher, Huntington mill and concentrating tables, on the Soquite Prieto mine, five miles south of Ayutla, and work will be resumed at the mine at once.——Manager J. O. Hestwood, of the Atreveda Mining & Development Co.'s mine, at Atreveda, near Jalisco, states that plans are perfected for the installation of a new mill and additional cyanide machinery at the mine, and that the machinery will be shipped within the next few weeks. He expects to have the machinery in place within 90 days. Improved hoisting and pumping outfits for deep-level mining will also be installed. Shaft No. 2 will be continued several hundred feet below the 200-ft. level.

Mexico.

The officials of the United States & Mexico Mining Co., of Mexico City, have ordered tools, supplies and ore sacks for their mine at Zacualpan.

A. Velas, of La Mula ranch in the eastern part of Chihuahua, has denounced 20 pertenencias below the town of Ojinaga, for quicksilver. The location is 15 miles northeast of San Carlos, and is said to be only 12 miles from the Mariposa quicksilver mine in Terlingua district in Texas.

It is believed that the Terlingua quicksilver belt extends across the Rio Grande river into Chihuahua, but nothing has been done to develop any of the properties in this State, although a number of locations have been made.

Sonora.

J. T. Jackson, of Philadelphia, has been granted a concession to exploit the Quitovac placer mines in the Altar district, 161 miles from Santa Ana station, on the Sonora railroad.

The Sierra de Cobre Mining Co. is installing a large pump at its mine near Cananea, and will resume sinking on the main shaft.

Personal.

THOMAS BARBOUR is in New York.

J. H. MACKENZIE has returned from Seattle.

F. F. THOMAS is investigating mines in Arizona.

C. C. GATES, of Denver, Colo., is in San Francisco.

ERNEST A. WILTSEE has been visiting Mexico City.

GEORGE W. PEIRCE is at Battle Mountain, Nevada.

JAMES PENALUNA has returned from Italy to Cornwall.

FRANK H. TEATS has returned to Denver from Dutch Guiana.

W. E. THORNE has returned to Denver from San Francisco.

GEORGE W. BRYANT, of Guanajuato, is visiting New York.

WALTER M. BRODIE is examining mines at Guanajuato, Mexico.

WILLIAM N. CUMMINGS is examining mines at Silver Peak, Nevada.

J. PARKE CHANNING has been visiting the Lewisohn properties at Butte.

GEORGE D. BLOOD has returned from Nicaragua and is at Salt Lake City.

H. L. HOLLIS, of Chicago, is visiting Guanajuato with a party of clients.

THEODORE J. HOOVER has headquarters now at Aguascalientes, Mexico.

ARTHUR O. CAUTLEY, representing Bewick, Moreing & Co., is at Guanajuato.

EDWIN C. HOLDEN, of New York, is examining mines in New Mexico and Colorado.

JOHN WATT leaves for New Zealand next week to investigate dredging methods.

FORBES RICKARD is visiting Pittsburg, from which place he will proceed to Arizona.

ARTHUR L. WALKER has returned from Seattle and Salt Lake City to San Francisco.

W. H. STORMS has become an assistant editor of the MINING AND SCIENTIFIC PRESS.

JOHN JACOBS has resigned the management of the Velardeña smelter, in Durango, Mexico.

R. M. ATWATER, of Helena, Mont., is examining the Sunnyside mine, at Silverton, Colorado.

C. E. BUNKER is superintendent of the Yaeger Canyon Copper Co., near Prescott, Arizona.

W. H. SHOCKLEY, on his return from Russia, has taken up residence at Tonopah, Nevada.

STEPHEN H. LETT has left London to take charge of exploratory work in Portuguese East Africa.

WARNER MCCANN, with the Hacienda de San Francisco, at Pachuca, Mexico, is in San Francisco.

A. H. ACKERMAN has accepted an appointment with the British South Africa Company, at Bulawayo.

J. B. MCDONALD has been appointed superintendent of the New Monarch group, at Leadville, Colorado.

DAVID T. DAY, of the United States Geological Survey, was a visitor in San Francisco during the week.

F. L. BOSQUI has gone from Chihuahua, Mexico, to Goldfield, Nevada, and will return to San Francisco this week.

J. H. HINDRY, manager of the Esperanza mine at El Oro, is also to have charge of the Velardeña smelter, in Mexico.

GEORGE H. ROBINSON is visiting the Britannia mine, Howe Sound, Vancouver island, whence he will go to New York.

F. R. BURNHAM, who earned fame as a scout during the Boer war in South Africa, is engaged in mining in Sonora, Mexico.

T. PENROSE is in charge of the Yampa mine at Bingham Canyon, Utah, during the illness of Superintendent NICK TRELOAR.

THEODORE E. SCHWARZ has been appointed consulting engineer for the Iron-Silver Mining Co., of Leadville and New York.

E. H. DAVISON has returned to San Francisco from Amalie district, Kern county, Cal., and reports considerable activity there.

M. J. LIDSTONE has returned to San Francisco from Searchlight, Nevada, where he built a mill for the Searchlight Mining Company.

GODFREY DOVETON, of Doveton & Purington, has left Denver for Telluride, where he will be professionally engaged at the Liberty Bell mill.

JOHN B. FARISH, consulting engineer and general manager of The Mines Finance Co., of 40 Wall street, New York, has been re-engaged as consulting engineer for the Dolores Mines Co., of Chihuahua, and the Creston-Colorada Co., of Sonora. GEORGE J. MCCARTY, who has been manager of the latter property for a number of years, is identified with MR. FARISH in the above enterprises, and will hereafter make his headquarters in New York.

Obituary.

DAVID MCCOOK, an old-time mine owner, died at Yreka, Siskiyou county, Cal., one day last week.

METALS.

SILVER.—Per oz., Troy: New York, (by wire), bar silver, 66½c. per fine ounce; San Francisco, 66½c.; London, 30½d. (standard ounce, 925 fine); Mexican dollars, 52@54c., San Francisco; 51½c., New York.

COPPER.—New York (by wire, average for week ending Feb. 23), Lake, $18@18.25.; Electrolytic, 17.75@18.00c.; Casting, 17.50@17.62c. per pound. Mill copper plates, $21.00; bars, 21@24c. London: £78 spot per ton.

The total visible supply of copper in the world on February 1 was 10,951 tons, being nearly 5,000 tons less than Feb. 1, 1905, and 2,032 tons less than Jan. 2, 1906.

LEAD.—New York (by wire, average for week ending Feb. 23), $5.35 per 100 lb; San Francisco, pig, 5.70@6.60c. per lb.; pipe 8@8½c.; sheet, 9@9½c.; London: £15 15s. ℔ long ton.

SPELTER.—New York (by wire, average for week ending Feb. 23), $6.05@6.10 ℔ 100 lb.; London, £25 17s. 6d. ℔ ton; San Francisco, ton lots, 7c.; 100-lb lots, 7¾c.

TIN.—New York, pig, $36.20@36.40; bar tin, ℔ lb., 42½c.; pig, 39c. London, £166.

PLATINUM.—San Francisco, crude, $18.50 ℔ oz.; New York, ingot, nominal, $20@25 ℔ Troy oz. Platinum ware, 75@$1.00 ℔ gram.

QUICKSILVER.—New York, $40.00@$41.50, large lots; London, £7 7s 6d.; San Francisco, local, $38.00@39.00 ℔ flask of 75 lbs.

NICKEL.—New York, 48@60c ℔ lb.; ton lots, 40@47c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c.; dust, ℔ lb., 10c.; sulphate, ℔ lb., 4c.

BABBITT METAL.—San Francisco, No. 1, 10½c.; No. 2, 8c.; No. 3, 7½c.; extra, 17½c.; genuine, 32½c.; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 23.50c; San Francisco, Plumbers', 100-lb. lots 19.75c.

ALUMINUM.—No. 1, 99%, small lots, 33@37c. ℔ lb.; 100 lbs., 35c.; 1000 lbs., 34c.; ton lots and over, 33c., Pittsburg. No. 2, 90%, small lots, 34c.; ton lots and over, 31c, Pittsburg.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $18.50; gray forge, $17.25; San Francisco, bar, 3½c. ℔ lb., 3¾c. in small quantities.

STEEL.—Bessemer billets, Pittsburg, $26.00 open hearth billets, $27.50; San Francisco, bar, 7c to 13c ℔ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 8½c.; less than 500 lb., per lb., 8¾c.; in 25-lb. tin pails, ½c. ℔ lb. above keg price; in 1 and 5-lb. tin cans, 100 lb. per case, ½c. per lb. above keg price. Dry Lead.—In bbl., 1 ton and over, 8c.; do. in kegs, 8½c.

LIME.—Santa Cruz, $1.35 country, $1.25 city ℔ bbl.

CEMENT.—Imported, $3.00@4.00 ℔ bbl.; California, carload lots, $1.80 f. o. b. at works; small lots, $2.10 ℔ bbl. in sacks, 4 sacks to bbl., 5c for each sack returned.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00;shingles, $2.50 for No. 1, and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $1.85; Cut, $1.75. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d, Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4d and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

GENERAL SUPPLIES.

ANTIMONY.—New York, per quality, 14c@15c; San Francisco, 1000-lb. lots, 14c; 300@500-lbs. 12c, 100-lb. lbs. 12c; 100-lbs lots, 13c.

BONE ASH.—Extra No. 1, 6c ℔ lb; No. 1, 5c½.

BORAX.—Concentrated, 9¼c ℔ lb; powdered, 10c; fused, 25c; crystal, refined, 8c.

CANDLES.—Standard Oil Co.—Electric light, 16 oz., 11c; 14 oz., 9¾c; 12 oz., 8½c; 14 oz., 7¾c; Hotel, 12 oz., 9c; Granite (mining), 16 oz., 11½@11¾c; 14 oz., 10@10½c; 12 oz., 9½@9¾c; 10 oz., 8½c; Paraffines, White, 1s, 2s, 4s, 6s, 10½c; 12s, 11c; colored, 1c higher; Radiant Paraffines, 4s, 6s, 14 oz., 9½@9¾c; 10 oz., 7¾c.

CAPS.—3x, $5.50@6 per 1000; 4x, $6.50@7; 5x, $8@8.50; Lion, $9@9.50, in lots not less than 1000.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3½c ℔ lb.; caustic soda, in drums, 3@3¼c ℔ lb.; Cal. s. soda, bbls., $1.10@1.20 ℔ 100 lbs.; sks., 90c@$1.00; chlorate of potash, 12@13c; nitrate of potash, 6½@7c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2¼@2½c; flour sulphur, French, 2¾@—c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 6½@7c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66° B. 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitroglycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1**, 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2**, 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg

Books Received.

Mineral Statistics of Chile for 1903, under the auspices of the National Mining Society, and sanction of the Governor Sir William Yunge. It is an exposition of the mineral industry in Chile during the year 1903, and contains several maps. The publication is wholly in Spanish.

Clifton Folio, No. 129, of the Geologic Atlas of the United States, has been issued by the United States Geological Survey. It came up to the standard of these publications, and will be of great interest and value to those interested in copper deposits of Clifton and incidentally elsewhere.

"Report of the State Inspector of Mines for Idaho in 1905." This annual volume is somewhat of an improvement on the previous interesting annual official contributions of Robert N. Bell, State Mine Inspector. The mineral industry of the State is reviewed by counties, and is well illustrated by numerous half-tones and line drawings. It shows the industry in Idaho to be in a satisfactory condition and extending yearly. The publication of this report thus early in 1906 is commendable, and might be emulated by some others in charge of similar work.

Perhaps more has been written about cement during the past two years than about any other one material. The latest addition to the shelf of cement books is 'Practical Cement Testing,' by W. P. Taylor. The most praiseworthy, because unusual, feature of the text is that the author sticks to his subject and does not get side-tracked on other branches. It is essentially devoted to a discussion and description of the methods of cement testing. The daily routine work of the testing laboratory is detailed for the guidance of the practicing engineer and builder. After a preliminary discussion on shipping and sampling, the author discusses in detail the usual physical tests, such as specific gravity, fineness, time of setting, tensile strength and soundness. These are followed by the methods of chemical analyses and chapters on special tests. In each case, after defining the test and its object, and reviewing the conditions likely to affect it, the author details each of the manipulative steps, including full instructions as to the use and abuse of apparatus. The interpretation of results is minutely explained. The cement-testing laboratory is discussed in equipment, organization and operation. The book is concluded with examples of cement specifications. This section combines both the abstract and the concrete, being an excellent abstract of the fundamentals of concrete specifications. It should do much to insure the life and strength of our homes and factories in the future. It is published by the Myron C. Clark Publishing Co., 13-21 Park Row, New York City, and will be sent postpaid by the MINING AND SCIENTIFIC PRESS for $3.

Commercial Paragraphs.

EDGAR INGRAHAM, who has recently returned from South Africa, is now with Harron, Rickard & McCone of San Francisco.

THE C. O. Bartlett & Snow Co., of Cleveland, Ohio, report the following sales: Mining machinery to D. H. Norris, Zacatecas, Mex.; plaster plant to Mahoning Builders' Supply Co., Youngstown, O.; coal-handling machinery to Monongahela R. Con. Coal & Coke Co., Pittsburg, Pa.; mining machinery to Montana Zinc Co., Butte, Mont.; special conveyor and elevator to Barnesville Glass Co., Barnesville, O.; conveying and elevating machinery to Greenville Silica Sand & Quarry Co., Greenville, Pa.

The Shattuck-Arizona Mining Co. of Bisbee, Arizona, has closed a contract with the Allis-Chalmers Co. for a double-drum duplex direct-acting Corliss hoisting engine. The steam end of this hoist will consist of two Corliss engines of the heavy duty type, having cylinders 20 in.x48 in., the engine being designed to withstand the excessive strains incident to hoisting work. The hoist will operate at 125 lb. steam pressure, and will handle continuously a total unbalanced load of 15,000 lb. at a hoisting speed of 2,000 ft. per minute. The engine is so designed that the steam pressure may be later raised to 150 lb., and is proportioned to handle the increased load which this pressure will make possible from the depth and at the speed above mentioned. There will be two drums 7 ft. in diameter having turned grooves, each holding 1,500 ft. of 1⅛ in. rope. These drums will be loose on the drum-shaft and served by powerful friction clutches. The hoist will be entirely steam-operated, and, in fact, embodies all the latest hoisting ideas in modern hoisting practice. Local conditions in this district surrounding previous installations of this size and character have precluded the use of drums, all the larger hoists being of the reel type. Consequently the operation of this hoist will be watched with interest by the mining men in Bisbee and adjacent camps.

Dividends.

To-day the Bunker Hill & Sullivan Mining & Concentrating Co. declared dividend No. 102 of $180,000, payable on March 3. This makes the total paid since January 1, 1906, $540,000, and total to date $6,066,000.
